cocktail, short mixed drink originating in the United States and served as an appetizer. It generally has a basis of gin, whisky, rum, or brandy combined with vermouth or fruit juices and often flavored with bitters or grenadine. It is blended by stirring or shaking in a vessel containing cracked ice. The term is also applied to nonalcoholic beverages served as appetizers, e.g., tomato juice cocktail, and also to mixed, cut-up fruits and to shellfish and oysters served with a sharp sauce.

Cocoa, city (1970 pop. 16,110), Brevard co., E Fla., on the Indian River (a lagoon), a segment of the Intra-coastal Waterway, inc. 1895. It is a tourist center in a region where citrus fruits are grown. An 8-mi (12.9 km) causeway leads from the city over Indian River to Merritt Island, Cocoa Beach, and Cape Canaveral. Brevard Community College is in Cocoa. Patrick Air Force Base is nearby.

COCOA: see CACAO

coconut, fruit of the coco PALM (*Cocos nucifera*), a tree widely distributed through tropical regions. The seed is peculiarly adapted to dispersal by water since the large pod holding the nut is buoyant and impervious to moisture. The trees therefore establish themselves naturally on small islands and low shores bordering the tropic seas. The tree grows to a height of from 60 to 100 ft (18–30 m), with a smooth cylindrical stem marked by the nonglacial scars of former leaves. It bears at the top a crown of frondlike leaves and yellow or white blossoms. The number of nuts varies, a well-cared-for tree may yield 75 to 200 or more annually. The mature fruit as it comes from the tree is encased in a thick, brown fibrous husk. The nut itself has a hard woody shell, with three round scars at one end, the embryo lies against the largest scar and emerges through it as a developing plant. Through this easily punctured spot the milk of the young coconut may be drained. Its constantly growing commercial value has led to extensive cultivation of the coconut, especially in the Malay Archipelago, Sri Lanka, and India. A few are found in the southern extremity of Florida. The coco palm is

one of the most useful trees in existence, every part of it having some value. The fruit, either ripe or unripe, raw or cooked, is a staple food in the tropics, the terminal bud, called palm cabbage, is considered a delicacy, and the inner part of young stems is also eaten. The milk of the young nut is a nutritious drink. A sweet liquid obtained from the flower buds ferments readily and is used as a beverage, both when fresh and when distilled to make arrack, it may be boiled down to make various palm sugars, e.g., jaggery. The leaves are used for making fans, baskets, and thatch. The coir (coarse fibers obtained from the husk) is made into cordage, mats, and stuffing, it becomes more buoyant and elastic than hemp in salt water. The hard shell and the husk are used for fuel. The fibrous center of the old trunk is also used for ropes, and the timber, known as porcupine wood, is hard and fine-grained and takes a high polish. From the nutshells are made containers of various kinds—cups, ladles, and bowls—often highly polished and ornamentally carved. The root is chewed as a narcotic. Commercially the greatest value of the coconut lies in the oil, which is extracted from the dried kernels of the fruit. The nuts when ripe are apt to spoil or become rancid. Therefore when they are gathered they are broken open and the flesh is dried and exported under the name of copra. The oil content of copra ranges from 50% to 70% depending upon the method of drying. The coconut and the olive are the earliest recorded sources of vegetable oil. Coconut oil, the major type of palm oil, has been extracted by mortar and pestle in the Orient since antiquity. Primitive methods of drying and expressing the copra are giving way to modern machinery, such as rotary driers and hydraulic presses. The residue, known as coco cake, makes excellent cattle food, as it usually contains a remnant of from 6% to 10% of oil. Large quantities of shredded or desiccated coconut made from copra and many whole coconuts are exported for use chiefly in the making of cakes, desserts, and confectionery. Coconuts are classified in the division MAGNOLIOPHYTA, class Liliatae, order Arecales, family Palmaeaceae.

COCOON: see PUPA

Cocopa Indians (kōkōpā), North American Indians whose language belongs to the Yuman branch of the Hokan-Siouan linguistic stock (see AMERICAN INDIAN LANGUAGES). They formerly lived near the mouth of the Colorado River and in the mountains of S California. Since there was little wild game in the area, the Cocopa cultivated corn, melons, pumpkins, and beans. Some were moved to a reservation in California, and some to Mexico, where they are known as the Cucupá.

Cocos Islands (kōkōs) or **Keeling Islands**, two separate atolls comprising 27 coral islets (1970 pop. 611), 55 sq mi (14.2 sq km), in the Indian Ocean, c 1,400 mi (2,250 km) SE of Sri Lanka. They are under Australian administration. Discovered in 1609 by Capt. William Keeling of the East India Company, the Cocos were settled in 1826 by Alexander Hare, an Englishman. A second settlement was founded in 1827 by John Clunies-Ross, a Scottish seaman, who landed with a boatload of Malay sailors. In 1857 the islands were annexed to the British crown. Queen Victoria granted the lands to the Clunies-Ross family in 1886 in return for the right to use any land on the island for public purposes. In 1903 the islands were included in the STRAITS SETTLEMENTS, and in 1955 they were placed under Australian administration. Only three of the islands are inhabited. West Island, which has an airport and the largest community of Europeans, Home Island, headquarters of the Clunies-Ross Estate, and Direction Island, which has an aviation-marine base. The economy is based on the production of copra and on aviation and government facilities maintained by the Australian government.

Cocteau, Jean (zhāN kōktō'), 1889–1963, French writer, visual artist, and filmmaker. Cocteau's versatility in the arts is unrivaled in the 20th cent. He experimented audaciously in almost every artistic medium, becoming a leader of the French avant-garde in the 1920s. His first great success was the novel *Les Enfants Terribles* (1929), which he made into a film in 1950. Surrealistic fantasy suffuses his films and many of his novels and plays. Among his best dramatic works are *Orphée* (1926) and *La Machine infernale* (1934, tr. 1936), in which the Orpheus and Oedipus myths are surrealistically adapted to modern circumstances. His films include *The Blood of a Poet* (1933), *Beauty and the Beast* (1946), and *Orphée* (1949). Among other works are ballets, sketches, monologues, whimsical drawings,

and the text (written with Stravinsky) for the opera-
Oedipus Rex (1927) See his autobiography,
 comp from his writings by Robert Phelps (tr 1970),
 biographies by Frederick Brown (1968), Elizabeth
 Sprigge and Jean-Jacques Kihm (1968), and Francis
 Steegmuller (1970), Margaret Crosland, ed., *Coc-
 teau's World* (tr 1972)

Cocx, Gonzales* see COQUES, GONZALES

Cocytus (kōsī'tās) see HADES

cod, member of the large family Gadidae, compris-
 ing extremely important and abundant food fishes.
 The cods include the hake and the haddock, all
 found in the N Atlantic and Pacific. The cod was
 extremely important to the economic and social
 growth of New England; it has been used as a Mas-
 sachusetts state emblem. All cods are bottom-feed-
 ers with soft fins, the large ventral fins are located
 under or in front of the pectorals rather than behind
 them as in other fishes. The Atlantic cod varies in
 color but has two distinct phases, gray-green and
 reddish brown. Its average weight is 10 to 25 lb (4.5-
 11.3 kg), but specimens weighing up to 200 lb (90
 kg) have been recorded. About 30,000 tons of cod
 are caught annually. Cods feed on mollusks, crabs,
 starfish, worms, squid, and small fish. Some migrate
 south in winter to spawn. A large female lays up to
 five million eggs in mid-ocean, a very small number
 of which survive. The Pacific cod is found N of Ore-
 gon. Small cod prepared in strips for cooking is
 called scrod. The tomcod resembles a young Atlan-
 tic cod with long, tapering ventral fins. It rarely ex-
 ceeds 15 in (37.5 cm) in length and lives close to
 shore. There is also a Pacific tomcod. The pollack,
 also called coalfish or green cod, is a plump olive-
 green cod found in cool waters on both sides of the
 Atlantic. Pollacks have forked tails and pale lateral
 lines and grow to 3 ft (90 cm) and 30 lb (13.6 kg),
 10,000 tons are taken yearly. The haddock is the
 most important food fish of Atlantic waters, the an-
 nual catch amounting to 50,000 tons, most of which
 is marketed frozen. It is also found in colder Euro-
 pean waters. Haddocks are also bottom-feeders but
 are found in deeper water (up to 100 fathoms). They
 are smaller than cods, reaching a top weight of 30 lb
 (13.6 kg) and length of 3 ft (90 cm) and have black
 lateral lines and dark side patches. Finnan haddie is
 lightly smoked haddock. The burbot is the only
 freshwater cod, found deep in northern streams and
 lakes. It has a single barbel on its chin. A similar
 burbot is found in Europe and Asia. Lings and hakes,
 closely related to the cod, are fishes of commercial
 importance found in warmer waters. They are slen-
 derer than the cod and have weak tails but are
 strong swimmers, preying on crustaceans and small
 fish. Cods are classified in the phylum CHORDATA,
 subphylum Vertebrata, class Osteichthyes, order
 Gadiformes, family Gadidae. See A. C. Jensen, *The
 Cod* (1972).

Coddington, William, 1601-78, one of the found-
 ers of Rhode Island, probably b. Boston, England.
 He came to America in 1630 as an officer of the Mas-
 sachusetts Bay Company and was its treasurer from
 1634 to 1636. He supported Anne HUTCHINSON in the
 antinomian controversy. With her, JOHN CLARKE, and
 other Puritan exiles, he purchased the island of
 Aquidneck (Rhode Island) from the Narragansett In-
 dians and founded Portsmouth (1638). Deposed
 (1639) as leader of the settlement by Hutchinson
 and Samuel GORTON, Coddington withdrew with
 Clarke and founded NEWPORT. The two towns were
 joined under Coddington's governorship in 1640.
 He opposed, however, the union with the mainland
 settlements of Providence and Warwick, which took
 place in 1647 under a patent received in 1644 by
 Roger WILLIAMS. The commission Coddington re-
 ceived in 1651 to govern for life Aquidneck and
 neighboring Conanicut Island was denounced by
 the island people, and Williams and Clarke suc-
 ceeded in having it revoked in 1652. Coddington
 remained influential in Newport affairs and was
 governor of the united colony of Rhode Island and
 Providence Plantations in 1674, 1675, and 1678.

code, in communications, set of symbols and rules
 for their manipulation by which the symbols can be
 made to carry information. By this extended defini-
 tion all written and spoken languages are codes.
 While these are sufficient and actually quite efficient
 in transmission of information, they are at times am-
 biguous and are highly inefficient for telecommuni-
 cations. For example, a circuit capable of carrying a
 voice message, e.g., a telephone circuit, could carry
 several times as much information if that informa-
 tion were represented as telegraphic code. Special
 codes are also used for representing data inside a
 computer. Generally speaking, INFORMATION THEORY

shows that for any particular application there is an
 optimum code; it does not, unfortunately, tell how
 to devise the code. For use in a COMPUTER, informa-
 tion is encoded as strings of binary digits, for tele-
 graphic work, codes such as the MORSE CODE, con-
 sisting of a series of dots and dashes or marks and
 spaces, are used. Certain arbitrary codes are used to
 ensure secrecy of communication, although the
 eavesdropper may have access to the message, he
 does not know the rules by which the symbols are
 associated and cannot convert the message into a
 form he can understand. See CRYPTOGRAPHY, SIGNAL-
 ING.

code, in law, in its widest sense any body of legal
 rules expressed in fixed and authoritative written
 form. A STATUTE thus may be termed a code. Codes
 contrast with customary law (including COMMON
 LAW), which is susceptible of various nonbinding
 formulations, as in the legal opinions of judges. The
 earliest codes (e.g., the Roman TWELVE TABLES) met
 the popular demand that oral regulations be written
 down so that legal chicanery might be prevented. In
 later Roman law, however, the term code acquired
 its modern meaning of a precisely formulated state-
 ment of the principles underlying some branch of
 law (e.g., contracts) or an entire legal system. One of
 the greatest codes was the Roman CORPUS JURIS CIVILIS.
 In Europe, in the late 18th cent., after the general
 adoption of CIVIL LAW by the continental countries,
 jurists asserted that similar codes were needed, and
 the parent modern European codification, the CODE
 NAPOLÉON, appeared (1804) and was followed by
 many others. The civil law code is an attempt to
 determine in advance what legal exigencies will
 arise and to furnish the means for meeting them.
 Basic legal principles (e.g., that contracts express the
 will of the parties) are worked out in systematic de-
 tail and great attention is given to consistency. The
 movement for codification, however, has been
 largely unsuccessful in countries where common
 law prevails, such as the United States, despite the
 argument that the principles of common law are
 sometimes uncertain and often contradict one an-
 other. Advocates of the common law assert that civil
 law makes possibly futile attempts to predict and
 control the course of developments. In the United
 States the term code is sometimes also applied to
 the statutes of a state or of the Federal government
 edited so as to eliminate duplication and inconsis-
 tencies and arranged under appropriate headings.
Code Civil: see CODE NAPOLÉON.

codeine (kō'dēn), alkaloid found in OPIUM. It is a
 NARCOTIC whose effects, though less potent, resem-
 ble those of MORPHINE. An effective cough suppres-
 sant, it is mainly used in cough medicines. Like oth-
 er narcotics, codeine is addictive. See DRUG
 ADDICTION AND DRUG ABUSE.

Code Napoleon (kōd napōlāōN') or **Code Civil**
 (sēvēl'), first modern CODE of France, promulgated
 by Napoleon I in 1804. The work of J. J. Cambacères
 and a commission of four appointed by Napoleon I
 in 1800 was important in making the final draft. The
 Code Napoleon embodied the private law of France
 (i.e., law regulating relations between individuals)
 and, as modified by amendments, it is still in force
 in that country. It is a revised form of the ROMAN
 LAW, i.e., the CIVIL LAW, which prevailed generally on
 the Continent. It shows, of course, many specific
 French modifications, some based on the GERMANIC
 LAW that had been in effect in N France. The code
 follows the Institutes of the Roman CORPUS JURIS CIVILIS
 in dividing civil law into personal status (e.g.,
 marriage), property (e.g., easements), and the ac-
 quisition of property (e.g., wills), and it may be re-
 garded as the first modern analogue to the Roman
 work. Not only was it applied by Napoleon to the
 territories under his control—N Italy, the Low Coun-
 tries, and some of the German states—but it exerted
 a strong influence on Spain (and ultimately on the
 Latin American countries) and on all European
 countries except England. It was the forerunner, in
 France and elsewhere, of codifications of the other
 branches of law, including civil procedure, com-
 mercial law, and criminal law. Quebec prov. and the
 state of Louisiana owe much of their law to the
 Code Napoleon. In addition to the Code Civil,
 Napoleon was responsible for four other codes: the
 Code of Civil Procedure (1807), Commercial Code
 (1808), Code of Criminal Procedure (1811), and the
 Penal Code (1811).

codling moth (kōd'ling), small moth, *Carpocapsa*
pomonella, whose larva is the destructive apple
 worm. Of European origin, it is now found where-
 ever apples are grown. The adult moth is gray with
 brown markings and has a wingspan of about ¾ in

(18 cm). The ¾-in larva is pinkish, with a brown
 head. There are several generations a year; the early
 eggs are deposited on leaves and the later ones di-
 rectly on the developing fruit. The larvae feed inside
 the fruit and pupate (see INSECT) on the bark of the
 tree. Apple worms also attack pears, quinces, and
 English walnuts. The codling moth is classified in
 the phylum ARTHROPODA, class Insecta, order Lepi-
 doptera, family Olethreutidae.

cod-liver oil, yellowish oil obtained from the liver
 of the codfish. The oil is rich in vitamin A and vi-
 tamin D (calciferol). It was long used as a preventive
 and cure for RICKETS in Baltic and Scandinavian
 countries, where fish is a dietary staple. However, it
 was not until the 1920s that doctors in the U.S. fi-
 nally recognized its therapeutic usefulness. More
 palatable synthetic vitamins have largely replaced
 cod-liver oil as dietary supplements, and almost all
 the milk sold in the United States and Europe now
 contains added vitamins A and D. See VITAMIN.

codon* see NUCLEIC ACID

Codreanu, Corneliu Zelea (kōrnē'lyōō zēl'yā
 kōdrēā'nōō), 1899-1938, Romanian political leader
 and anti-Semitic terrorist. Active in the Romanian
 student movement against leftists and liberals, he
 founded (1927) and led the militant, fascist IRON
 GUARD until his conviction for treason in 1938. He
 shot and killed the prefect of Iași in 1924 and insti-
 gated the murder of Premier Ion Duca in 1933. Both
 times he was acquitted. Shortly after his imprison-
 ment in 1938, he and 13 of his followers were killed,
 allegedly while trying to escape.

Codrington, Sir Edward (kōd'rīngtən), 1770-1851,
 British admiral. He held various commands in the
 French Revolutionary and Napoleonic wars, taking
 part in the battle of Trafalgar (1805) and serving
 (1810-13) in the Mediterranean. He commanded the
 combined British, French, and Russian fleet that in
 1827 destroyed the Turkish and Egyptian fleets in the
 battle of NAVARINO.

Cody, William Frederick: see BUFFALO BILL

Cody (kō'dē), city (1970 pop. 5,161), seat of Park co.,
 NW Wyo., on the Shoshone River in a sheep, cattle,
 and irrigated farm area, founded and inc. 1901 by
 William F. Cody (Buffalo Bill). It is a tourist resort at
 the eastern entrance to Yellowstone National Park,
 with dude ranches and a colorful old frontier town
 flavor. Oil from the Big Horn Basin is refined there.
 Cody is headquarters for the Shoshone National
 Forest. Of interest are the Buffalo Bill Historical
 Center, containing Cody memorabilia, the Whitney
 Gallery of Western Art, housing a notable collection
 of art of the Old West, and an annual rodeo. Sho-
 shone Canyon and the Shoshone project are nearby.

Coe College, at Cedar Rapids, Iowa, United Presby-
 terian, coeducational, founded 1851 as Cedar Rap-
 ids Collegiate Institute, chartered 1881 under its
 present name.

coeducation, instruction of both sexes in the same
 institution. The economic benefits gained from joint
 classes and the increasing participation of women
 in industrial, professional, and political activities
 have influenced the spread of coeducation. There
 were scattered examples of coeducation in the late
 17th cent. in Scotland and in the American Colo-
 nies, but there was no general trend until the great
 expansion of public education between 1830 and
 1845 in the developing W. United States. The dis-
 tance between schools in that region and the small
 number of pupils caused elementary schools to ad-
 mit girls. The movement spread naturally to the se-
 condary schools during the reorganization of public
 education after the Civil War. Oberlin College gave
 degrees to both men and women as early as 1837,
 but it was the development of state universities dur-
 ing the post-Civil War era that standardized col-
 legiate coeducation. During the late 1960s a number
 of formerly all-male and all-female colleges, includ-
 ing in 1969 Yale, Princeton, and Vassar, became co-
 educational. See Thomas Woody, *A History of
 Women's Education in the United States* (4th ed.
 1929, repr. 1966).

Coehorn, Menno van (mē'nō vān kōō'hōrn),
 1641-1704, Dutch military engineer and nobleman.
 He invented a portable bronze siege mortar called
 the cohorn. He was considered in his day a rival of
 Vauban in the construction of fortresses. He served
 (1702-3) in the army of the duke of Marlborough in
 the War of the Spanish Succession. The name also
 appears as Coehorn or Cohorn.

coelacanth: see LOBEFIN FISH

Coelenterata (silēn'tarā'tā), another name for the
 phylum CNIDARIA.

Coele-Syria: see BIQA AL

Coello, Claudio (klou'dyō kōā'lyō), c 1642–1693, Spanish baroque painter. As court painter to Charles II he decorated many churches and public buildings of Madrid. His most famous work is the monumental altarpiece for the sacristy of the Escorial, filled with portraits and allegorical figures.

coelom (sē'lām), fluid-filled body cavity, found in animals, which is lined by cells derived from MESODERM tissue in the EMBRYO, and which provides for free, lubricated motion of the viscera. In animals of the phyla ANNELIDA, MOLLUSCA, and ARTHROPODA, the mesoderm forms as a mass of tissue from special embryonic cells between an outer layer, the ECTODERM, and an inner layer, the ENDODERM. The coelom then forms as a result of the splitting and hollowing out of the mesodermal mass. In animals of the phyla ECHINODERMATA and CHORDATA, the mesoderm arises as the lining of folds developing from the endoderm, and the spaces within these folds form the coelom. The structure of the embryonic coelom is relatively simple, in an adult other organs push into the coelomic cavity, and it is also subdivided into compartments, e.g., the pericardial cavity, in which the heart develops.

coendou (kōēn'dōō) see PORCUPINE

coenzyme, any one of a group of relatively small organic molecules required for the catalytic function of certain ENZYMES. A coenzyme may either be attached by covalent bonds to a particular enzyme, or exist freely in solution, but in either case it participates intimately in the chemical reactions catalyzed by the enzyme. Often a coenzyme is structurally altered in the course of these reactions, but it is always restored to its original form in subsequent reactions catalyzed by other enzyme systems. ADENOSINE TRIPHOSPHATE (ATP) is a coenzyme of vast importance in the transfer of chemical energy derived from biochemical oxidations. Other NUCLEOTIDES (formed from URACIL, CYTOSINE, GUANINE, and INOSINE) have also been found to act as coenzymes. For example, uridine triphosphate—a derivative of uracil—has been demonstrated to be of great importance in the metabolism of carbohydrates, as in the biosynthesis of glycogen and sucrose. Those coenzymes that have been found to be necessary in the diet are vitamins. One such compound, biotin, is a member of the B complex; it was first isolated in 1935 from dried egg yolk, and its structure was established in 1942. Biotin is usually found attached to a lysine residue in certain enzymes, where it participates in reactions involving the transfer of carboxyl ($-COOH$) groups, one such reaction is essential for the synthesis of fatty acids. Another group of coenzymes is the cobalamin family, one member, cyanocobalamin (vitamin B₁₂), is known to be essential in the diet, although its role in metabolism remains obscure. Closely related cobalamins seem to be involved in the biosynthesis of methionine and methane. The complicated cyanocobalamin molecule was reported in 1973 to have been synthesized; it was first isolated from liver some 25 years prior to that date. Coenzyme A has been shown to participate in a variety of biochemical reactions, all involving acyl groups such as the acetyl unit, it is, for instance, associated with the pivotal first step of the Krebs cycle (see CITRIC ACID CYCLE) in which an acetyl unit (the breakdown product of carbohydrates) is introduced into the cycle to be converted eventually into carbon dioxide, water, and chemical energy. Coenzyme A is derived from adenine, ribose, and pantothenic acid (a vitamin of the B complex). The two flavin coenzymes, riboflavin mononucleotide (FMN) and flavin adenine dinucleotide (FAD), occur universally in living organisms and play important roles in biochemical oxidations and reductions. They are usually found tightly bound to certain enzymes (flavoproteins) and are derived from riboflavin (vitamin B₂). Glutathione, a tripeptide consisting of residues of glutamic acid, cysteine, and glycine, is known to act as a coenzyme in a few enzymatic reactions, but its importance may lie in its role as a nonspecific reducing agent within the cell. It is hypothesized that glutathione serves to maintain the biological activity of certain proteins by keeping selected cysteine sidechains in the reduced thiol form, thereby not allowing these residues to oxidize and cross-link with one another to form cystine residues (unnecessary cross-links often result in distortions of protein structure). Heme, a complicated molecule containing iron in the ferrous state, serves as a coenzyme in a variety of biochemical processes. It forms an essential part of the structure of HEMOGLOBIN and participates intimately in the uptake and release of oxygen by this protein. (In this case the use of the word "coenzyme" may be

inappropriate in that often hemoglobin is not considered to be an enzyme, since it does not catalyze a chemical reaction.) Heme is an important part of the CYTOCHROMES, enzymes that catalyze the biochemical oxidations and reductions involved in the production of chemical energy in the form of ATP, and heme is also associated with the various enzymes that catalyze the cleavage of peroxides. Lipoic acid seems to be involved in the removal of carboxyl groups from α -keto acids and in the transfer of the remaining acyl groups to various acceptors. Lipoic acid in fact transfers the acetyl group of pyruvic acid to coenzyme A. Like biotin, lipoic acid is commonly found attached to lysine residues within certain enzymes. It was first reported to have been purified and isolated in crystalline form in 1953. The nicotinamide nucleotides were the first coenzymes to be detected (1904) in extracts of a living organism. Nicotinamide adenine dinucleotide (NAD) and nicotinamide adenine dinucleotide phosphate (NADP) are derived from adenine, ribose, and nicotinic acid, or niacin (a vitamin of the B complex) and are important intermediates in the biochemical oxidations and reductions that provide chemical energy within the cell. Both NAD and NADP can be reduced by accepting a hydride ion (H^- , a proton with two electrons) from an appropriate donor, the resulting NADH and NADPH can then be oxidized back to their original states by transferring their hydride ions to various acceptors. In this fashion electron pairs (and protons) are shuttled about in the cell from high energy donors to lower energy acceptors. As a general rule, NADPH donates its hydride ions to biosynthetic processes, such as the fixing of carbon dioxide to make carbohydrates during the dark reaction of photosynthesis. NADH, on the other hand, donates its hydride ions to systems such as the cytochromes, which eventually donate them to oxygen to make (with the addition of a proton) water, producing chemical energy in the form of ATP as a by-product, the process is not yet completely understood. Pyridoxal phosphate is a coenzyme that is essential for many enzymatic reactions, almost all of which are associated with amino acid metabolism, it is, for example, involved in the synthesis of tryptophan, a derivative of pyridoxine (another vitamin of the B complex). The coenzyme tetrahydrofolic acid is derived in humans from the B-complex vitamin folic acid. This coenzyme and its close relatives participate in the transfer of various carbon fragments from one molecule to another, they are, for instance, involved in the synthesis of methionine and thymine. Thiamine pyrophosphate is derived from another B-complex vitamin, thiamine. This coenzyme often plays a role in the removal of carboxyl ($-COOH$) groups from organic acids, releasing the carbon and oxygen atoms as carbon dioxide (CO_2). This coenzyme, for example, helps to remove a carboxyl group from pyruvic acid, leaving behind an acetyl group, which it donates to lipoic acid, the lipoic acid then transfers the acetyl group to coenzyme A, which finally inserts it into the beginning of the Krebs cycle. This important three-step enzymatic process requires the participation of three coenzymes, hundreds of other biochemical reactions require coenzymes as well, and this serves to explain the great significance of those molecules in the functioning of living organisms. In the case of human beings, it also serves to explain the importance of proper dietary intake of vitamins, which provide the only source of certain "building blocks" for several of these coenzymes. See VITAMIN.

coercion, in law, the unlawful act of compelling a person to do, or to abstain from doing, something by depriving him of the exercise of his free will, particularly by use or threat of physical or moral force. In many states of the United States, statutes declare a person guilty of a misdemeanor if he, by violence or injury to another's person, family, or property, or by depriving him of his clothing or any tool or implement, or by intimidating him with THREAT of force, compels that other to perform some act that the other is not legally bound to perform. Coercion may involve other crimes, such as ASSAULT. In the law of contracts, the use of unfair persuasion to procure an agreement is known as DURESS, such a contract is void unless later ratified. At common law, one who commits a crime under coercion may be excused if he can show that the danger of death or great bodily harm was present and imminent. However, coercion is not a defense for the murder or attempted murder of an innocent third party.

Cœur, Jacques (zhak kōr), c 1395–1456, French merchant prince and adviser of King Charles VII, who

made him chief of finances and sent him on important diplomatic missions. His reforms restored order to the confused financial situation brought about by the Hundred Years War. Cœur established French trade in the Levant, employed agents throughout the Orient, owned factories and mines in France and abroad, and rivaled the great Italian merchant republics. Through his monopolies he amassed a fabulous fortune, but he spent a large part of it to finance the campaigns that ultimately drove the English from France. In 1451 he was arrested on the charge, concocted by his debtors and enemies, of having poisoned Agnes SORÉL. He was sentenced (1453), after an unfair trial, to imprisonment and a fine of several million francs. In 1454–55 he escaped to Rome. He died in Chios while leading a papal fleet against the Turks. His house in Bourges, which still stands, is one of the finest examples of secular medieval architecture. See A. B. Kerr, *Jacques Cœur* (1927).

Cœur d'Alene (kūrdālān'), city (1970 pop. 16,228), seat of Kootenai co., N Idaho, near the Wash. line, inc. 1907. It is a tourist and lumbering center situated on Cœur d'Alene Lake W of the Cœur d'Alene Mts.—the gateway to a beautiful summer and winter resort area. The city has numerous lumber mills, grass seed farms, and plants making electronic items and prefabricated homes. Fort Cœur d'Alene (later Fort Sherman) was established there in 1876. The city (named after a tribe of Indians that inhabited the area) grew around the fort after the discovery (1883) of the fabulously rich silver, lead, and zinc lodes and after the mining boom of 1884. For the tumultuous early history of the city, see WESTERN FEDERATION OF MINERS. The city is the headquarters of Cœur d'Alene National Forest and the seat of a junior college.

Cœur d'Alene Indians, North American Indians whose language belongs to the Salishan branch of the Algonquian-Wakashan linguistic stock (see AMERICAN INDIAN LANGUAGES). They occupied N Idaho and were also called the Skitswish. Long known as a peaceful group, the Cœur d'Alene were placed on reservations after an encounter with U.S. forces in 1858; they now number some 500 on a reservation in Idaho.

Cœur de Lion see RICHARD I, king of England

coffee, a tree, its seeds, and the beverage made from them. The Arabian coffee tree (*Coffea arabica*) is an evergreen shrub or small tree of the family Rubiaceae (Madder family). It is believed to be native to Ethiopia but was introduced into Arabia, probably during the 15th cent. Borne in the axils of the smooth, ovate leaves are clusters of fragrant white flowers that mature into deep red fruits about $\frac{1}{2}$ in (1.27 cm) long. The fruit, sometimes called a cherry, is a drupe, and usually contains two seeds, the coffee beans. Sometimes only one seed develops, the fruit is then called a peaberry. Varieties of Arabian coffee have long provided the bulk of the world's supply. Coffee requires a hot, moist climate with a rainfall of at least 50 in (127 cm) and a rich soil; it thrives on well-drained slopes, particularly where the soil is of volcanic origin. It can be grown from sea level to c. 6,000 ft (1,830 m). The better grades are generally produced above 1,500 ft (460 m). Frost is injurious. The plants are propagated from seed. Other taller vegetation is usually planted to control the amount of sunlight reaching the coffee trees and to protect them from the elements. A coffee tree produces its maximum yield sometime between the 5th and the 10th year and continues to bear for about the next 30 years. Other species of some commercial importance are Liberian coffee (*C. liberica*) and Congo coffee (*C. robusta*). Wide variations in production and demand have caused frequent surpluses disastrous to planters, laborers, and the national economy of producing countries. Experiments designed to employ the surplus for industrial purposes have shown the possibility of making such coffee derivatives as cattle fodder, alcohol, fusel oil, caffeine, and glycerin. A coffee quota agreement (1940), administered by the Inter-American Coffee Board (1941), attempts to stabilize the market by allocating the U.S. importation of coffee from Latin America. A considerable quantity of coffee is exported as parchment coffee (seeds within the husk-like covering, from which the outer pulp has been removed) to be finally cleaned and roasted at points of distribution. Heat acts upon the essential oils, developing the aroma and flavor. Roasts range from light brown to the very dark, almost charred, Italian roast. A wide variety of machines and theories for making coffee all aim to preserve the aroma. Whatever the method used, the prime requirements are

properly roasted, freshly ground coffee, freshly boiling water, and absolute cleanliness of utensils, as coffee is easily contaminated by foreign odors "Turkish" coffee, finely powdered and heavily sweetened, is drunk unfiltered by most Eastern peoples. Westerners favor clear coffee. The French use for breakfast café au lait, coffee combined with scalded milk. The unique mocha from the Yemen region of Arabia and some Sumatra, Java, and Colombian coffees are prized by connoisseurs. Various adulterants, including CHICORY, carrots, parsnips, iris root, beans, rice, and cereals, roasted and ground, may usually be detected by soaking in cold water, which is not discolored by genuine coffee beans. Opinion has differed as to the value of coffee. It has become a popular beverage because of its aroma and the exhilarating and fatigue-allaying properties of its CAFFEINE constituent, to which is attributed a medicinal value in cases of shock, pneumonia, and poisoning. Taken in excess it may cause irritability, depression, and indigestion. The early history of coffee is shrouded in legend. Known in Ethiopia before A.D. 1000, it is believed to have been used first as a food, a ball of the crushed fruit molded with fat was a day's ration for certain African nomads. Later, wine was made from the fermented husks and pulps. Coffee made from the ground and roasted beans was used in Arabia by the 15th cent and spread to Egypt and Turkey. Despite early suppression on religious and political grounds, it rapidly became a universal beverage of Arabs. At first opposed by Italian churchmen as an infidel drink, it was Christianized by Pope Clement VIII and by the mid-17th cent it had reached most of Europe. Although introduced in North America c. 1668, coffee took first place as the staple American beverage only after tea had met with popular disapproval following the Boston Tea Party. The production of instant coffee, experimented with as early as 1838, was started (1867) by Gail Borden in Illinois. It became increasingly popular after World War II. Coffee is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Rubiales, family Rubiaceae. See W. H. Ukers, *All about Coffee* (2d ed. 1938). Coffeehouses dispensed coffee before it was made in the home in Arab countries and in Europe and America and were known as centers for gossip, gambling, and literary and political discussions. Periodically government restrictions were imposed in the belief that coffeehouses were meeting places of political malcontents. Will's Coffee House in London was famous as a resort of wits and poets. Johnson, Addison, Steele, Sheridan, Dryden, Swift, Goldsmith, Hogarth, and other notables were the centers of coteries in the houses they frequented. In France also the spread of the coffeehouse was rapid and influenced the development of literature and of the stage.

coffee tree, *Kentucky*, common name for the plant species *Gymnocladus dioica*, a tree of the family Leguminosae (PUSE family). The seeds of the woody pods have been used as a substitute for coffee.

cofferdam, temporary barrier for excluding water from an area that is normally submerged. Made commonly of wood, steel, or concrete sheet piling (see PILE), cofferdams are used in constructing the foundations of dams, bridges, and similar subaqueous structures and for temporary drydocks. If double sheeting is utilized, the space between the sheets is usually filled with clay and gravel. When great strain or pressure is likely to be encountered, as in deep water, the pneumatic CAISSON is preferred to the cofferdam. See Lazarus White and E. A. Prentiss, *Cofferdams* (2d ed. 1956).

Coffeyville, city (1970 pop. 15,116), Montgomery co., SE Kansas, on the Verdigris River near the Oklahoma line, in a farm and oil area, inc. 1872. It is a trading and distributing center, with oil refineries and plants producing foundry and machine-shop products, inorganic chemicals, power transmission equipment, and milk and dairy items. With the coming of the railroad (1870), Coffeyville grew as a cattle-shipping point. Oil and natural gas were discovered in the area in 1902. The city was the scene (1892) of a famous shoot-out with the notorious Dalton gang during an attempted bank robbery. Of interest are the Dalton graves and the Dalton Museum. A junior college is there.

Coffin, Henry Sloane, 1877-1954, American Presbyterian clergyman, b. New York City. He was pastor of the Madison Ave. Presbyterian Church in New York City (1905-26), lecturer (1904-9), associate professor of pastoral theology (1909-26), and president (1926-45) of Union Theological Seminary. He was moderator (1943-44) of the General Assembly of the

Presbyterian Church in the U.S.A. His works include *The Meaning of the Cross* (1931), *God's Turn* (1934), *Religion Yesterday and Today* (1940), *God Confronts Man in History* (1947), and *Communion through Preaching* (1952). See biography by M. P. Noyes (1964).

Coffin, Levi, 1798-1877, American abolitionist, b. North Carolina. In 1826 he moved to the Quaker settlement of Newport (now Fountain City), Ind., where he kept a store until 1847. His home became a leading station of the UNDERGROUND RAILROAD, of which he was styled "president." See his *Reminiscences* (3d ed. 1898, repr. 1968).

coffin, closed receptacle for a corpse. Its purpose is usually to protect and to aid preservation of the body, although in the past some have believed that it may confine the spirit of the deceased. Bark, skins, and mats were commonly used in primitive societies to wrap the body prior to burial. Peoples living near rivers or oceans often buried their dead in canoes, and hollowed oak coffins have been found in the Bronze Age BARROW. The Chaldeans and the early Greeks enclosed a corpse in clay, sealing the coffin by firing it. The largest known stone coffins (see SARCOPHAGUS) are Egyptian. Wood and papier-mâché were also used in Egypt for mummy chests. Coffins lined with metal, usually lead, came into use in the Middle Ages. Most coffins used in the Western world today are made of elm or oak and are lined with bronze, copper, lead, or zinc.

Coggan, Donald (Frederick Donald Coggan), 1909-, English Protestant clergyman. Educated at Cambridge and ordained in 1934, Coggan began his ministerial career as curate of a London working-class church. He held academic posts in Toronto and London before becoming bishop of Bradford (1956) and archbishop of York (1961). A critic of apartheid and advocate of greater official tolerance for homosexuals, Coggan was appointed in 1974 to succeed Michael Ramsey as archbishop of Canterbury.

Cognac (kōnyāk'), city (1968 pop. 22,062), Charente dept., W France, in Angoumois, on the Charente River. The French brandy to which Cognac gives its name has been manufactured and exported from the city since the 18th cent. The city was the birthplace of Francis I and was a Huguenot stronghold in the 16th cent.

Cogswell, Joseph Green, 1786-1871, American librarian and bibliographer, b. Ipswich, Mass. After studying abroad, Cogswell taught mineralogy and geology at Harvard and became librarian in 1821. In 1823 he helped to found the Round Hill School at Northampton, Mass. He superintended the Astor Library in New York City (now part of the New York Public Library) and was librarian from 1848 to 1861 and trustee to 1864. He prepared an alphabetical and analytic catalog for the library, which was printed at his own expense and was the basis for the later card catalog.

Cohan, George Michael (kōhān', kō'hān, kō'ān), 1878-1942, American showman, b. Providence, R.I. As a child he appeared in vaudeville as one of "The Four Cohans" with his father, mother, and sister, Josephine. He eventually wrote the act and was the business manager. *The Governor's Son* (1901) was his first attempt at Broadway. *Little Johnny Jones* (1904) was his first success. Cohan wrote the book, music, and lyrics for 20 musicals; he was the producer, director, and most often the star. His inimitable style set the pattern of fast-moving, flippant and gay musicals, his characters were often modeled after real persons. Such shows as *Forty-five Minutes from Broadway* (1906), *Broadway Jones* (1912), *Hello, Broadway* (1914), and *The Song and Dance Man* (1923), and such songs as "The Yankee Doodle Boy," "Give My Regards to Broadway," and "You're a Grand Old Flag" show his preoccupation with flag-waving patriotism. Through his long career he had only one partner, Sam H. HARRIS. In 1913, Cohan revolutionized the mystery farce with his dramatization of Earl Derr Biggers' novel *Seven Keys to Baldpate*. He was an excellent adapter and play doctor; he described his adaptations as "Cohanized." His song "Over There," written during World War I, is now a classic. As an actor he was noted for his debonair characterizations, his performances in *O'Neill's Ah, Wilderness!* (1934) and as the President in *I'd Rather Be Right* (1937) were particularly notable. He made his last public appearance in his own play *Return of the Vagabond* (1940). See his *Twenty Years on Broadway* (1925, repr. 1971), biography by Ward Morehouse (1943).

Cohen, Hermann, 1842-1918, German philosopher. He was a founder of the Neo-Kantian Marburg

school and was known for his commentaries on Kant. His own works include *Logik der reinen Erkenntnis* (1902), *Ethik des reinen Willens* (1904), and *Aesthetik des Gefühls* (1912). See *Reason and Hope: Selections from the Jewish Writings of Hermann Cohen* (tr. Eva Jospe, 1971).

Cohen, Morris Raphael, 1880-1947, American philosopher, b. Minsk, Russia, grad. College of the City of New York, 1900, Ph.D. Harvard, 1906. He emigrated to the United States in 1892. At first an instructor in mathematics at the College of the City of New York, Cohen transferred to the department of philosophy, where he taught from 1912 until 1938, becoming famous for his use of Socratic irony. He then taught at the Univ. of Chicago until 1942. His influence, through his students and his books, has been far-reaching, and he is considered one of the most important American philosophers since William James. Cohen's most important books are *Reason and Nature* (1931, rev. ed. 1953) and *Law and the Social Order* (1933). Other works include *A Preface to Logic* (1944), *The Faith of a Liberal* (1945), and *American Thought: A Critical Sketch* (1954). See his autobiography, *A Dreamer's Journey* (1949), biography by L. C. Rosenfield (1962), study by C. F. Delaney (1969).

cohesion: see ADHESION AND COHESION

Cohn, Ferdinand (fēr'dēnānt kōn), 1828-98, German botanist. He is considered a founder of the science of bacteriology. From his early studies of microscopic life he developed theories of the bacterial causes of infectious disease and recognized bacteria as plants. He aided Robert Koch in preparing Koch's famous work on anthrax. Cohn's writings cover such diverse subjects as fungi, algae, insect epidemics, and plant diseases.

Cohnheim, Julius (yōō'lyōōs kōn'hīm), 1839-1884, German experimental histologist and pathologist. In a relatively brief life Cohnheim made a series of remarkable contributions to the rapidly developing science of pathology. In 1863 he completed important studies on the sugar-forming ferments of the salivary glands and pancreas. Subsequently, he joined Rudolf Virchow at the Pathological Institute in Berlin. Perhaps his most impressive study resulted in the final clarification of the mechanisms of inflammation and suppuration; he demonstrated the migration of leukocytes through blood-vessel walls, thus destroying Virchow's contention that no such passage, or diapedesis, takes place. He also studied venous thrombosis, the embryonic-rest theory of neoplasm formation, atypical leukemias, and experimental tuberculosis.

Cohoes (kəhōz'), city (1970 pop. 18,613), Albany co., N.Y., near Albany, at the confluence of the Mohawk and Hudson rivers, settled by the Dutch 1665, inc. 1869. Its manufactures include textiles (made there since 1840), knitted goods, paper products, boats, and electrical appliances. The world's first power-operated knitting mill was opened there in 1832. The Van Schaick Mansion (1735), built by the son of Cohoes's first settler, was used as headquarters by Gen. Horatio Gates during the Revolutionary War.

cohosh (kōhōsh'), name for several plants, among them BANEERRY and a species of BUGBANE, both of the family Ranunculaceae (BUTTERCUP family), and blue cohosh, a member of the family Berberidaceae (BARBERRY family). Both families are classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Ranunculales.

coiffure: see HAIRDRESSING

coil: see INDUCTOR, SOLENOID

Coimbatore (kwīm'bātōr'), town (1971 pop. 353,469), Tamil Nadu state, SE India. Commanding the approach to the Palghat Gap, the major pass through the Western Ghats, it was important in the wars of Haidar Ali and Tipu Sultan. The British obtained undisputed possession of Coimbatore in 1799. The town is now a district administrative center and a junction of rail lines linking the east and west coasts of India. Glassware, fertilizer, electrical goods, cement, and synthetic gems are produced. Coimbatore is also a market for tea, cotton, cardamom, cinchona, and teak.

Coimbra (kōēm'brā), city (1970 municipal pop. 108,046), capital of Coimbra dist., W central Portugal, on the Mondego River, in Beira Litoral. The old capital of Beira, it is a market center with small industries but is known chiefly for its history and for the famous university, which was founded (1292) by King Diniz in Lisbon but was moved temporarily to Coimbra in 1308 and permanently in 1540. Coimbra, then known as Conimbriga, was an important town

in Roman days It continued to flourish down through Moorish times and after its Christian recovery (1047) by Ferdinand I of Leon It became the capital of Alfonso I, first king of Portugal, and continued as an important royal residence after the capital was transferred to Lisbon in the 13th cent There is a fine 12th-century cathedral Ines de Castro was murdered there (1355)

coin, piece of metal, usually a disk of gold, silver, nickel, bronze, copper, or a combination of such metals, stamped by authority of a government as a guarantee of its value and used as MONEY Coinage was probably invented independently in Lydia or in the Aegean Islands and in China before 700 B C and in India in the 4th cent B C The earliest known example is an electrum coin (c 700 B C) of Lydia Roman coinage dates from about the 4th cent B C The first coins struck in the American colonies were issued by the Massachusetts Bay colony The first U S MINT was established in 1792 Mottoes used on many U S coins are "E Pluribus Unum" (1795) and "In God We Trust" (1864) Early coins were die-struck by hand and showed many individual variations Standardized coins date from the use (in the 17th cent) of a mill and screw machine (invented c 1561) Coins are usually stamped from rolled metal blanks, are milled, and have a design impressed upon them between the upper and lower dies of a coining press Milled or lettered edges have been used since the 17th cent to discourage the removal of slivers of metal, especially from gold or silver coins No American gold coins have circulated since 1934, when the United States abandoned the domestic gold standard Starting in 1965, the U S Treasury ceased to put silver in all newly minted dimes and quarters Previously, both coins had contained large amounts of silver At the same time, the silver content of the half-dollar was reduced from 90% to 40% See also NUMISMATICS

Cointreau: see CURAÇAO, liqueur

Cojutepeque (kōhōōtāpā'kā), city (1968 est pop 13,000), central El Salvador It is north of a volcano of the same name and is on the Inter-American Highway The city is a commercial and processing center for agricultural produce

Coke, Sir Edward (kōōk), 1552-1634, English jurist, one of the most eminent in the history of English law He entered Parliament in 1589 and rose rapidly, becoming solicitor general and speaker of the House of Commons In 1593 he was made attorney general His rival for that office was Sir Francis Bacon, thereafter one of Coke's bitterest enemies He earned a reputation as a severe prosecutor, notably at the trial of Sir Walter Raleigh, and held a favorable position at the court of King James I In 1606 he became chief justice of the common pleas In this position (after 1613), and as chief justice of the king's bench, Coke became the champion of common law against the encroachments of the royal prerogative and declared null and void royal proclamations that were contrary to law Although his historical arguments were frequently based on false interpretations of early documents, as in the case of the Magna Carta, his reasoning was brilliant and his conclusions impressive His constant collisions with the king and the numerous enemies he developed—especially that with Thomas Egerton, Baron ELLESMERE, the chancellor—brought about his fall Bacon was one of the foremost figures in engineering his dismissal in 1616 By personal and political influence, Coke got himself back on the privy council and was elected (1620) to Parliament, where he became a leader of the popular faction in opposition to James I and Charles I He was prominent in the drafting of the Petition of Right (1628) His most important writings are the Reports, a series of detailed commentaries on cases in common law, and the Institutes, which includes his commentary on Littleton's Tenures See W H Lyon and Herman Block, *Edward Coke* (1929), C D Bowen, *The Lion and the Throne* (1957)

Coke, Thomas (kōōk, kōk), 1747-1814, English clergyman and early bishop of the Methodist Episcopal Church in America After taking orders (1777) in the Church of England, he openly allied himself with the Methodists He was president of the Irish conference in 1782 and two years later was ordained as superintendent for America by John WESLEY When Coke was styled bishop shortly after the American conference of 1784, the change was not approved by Wesley Coke visited America nine times, the last time in 1803 Always deeply interested in Methodist missionary work, he sought (1813) an appointment by the government as bishop of India, agreeing to return to the Established Church As the request was

not granted, he himself secured funds for a Methodist mission, but died on the way to Ceylon See biographies by W A Candler (1923) and J A Vickers (1969)

Coke, Thomas William (kōōk), 1754-1842, English agricultural reformer, known as Coke of Holkham He improved breeds of cattle, sheep, and hogs on his country estate and greatly promoted improved methods of breeding and husbandry He was a member of Parliament for more than 50 years and in 1837 was made earl of Leicester

coke, hard, gray, massive, porous fuel prepared by the destructive DISTILLATION of bituminous COAL, much used when a porous fuel with few impurities and high carbon content is desired, as in the BLAST FURNACE Coke bears the same relation to coal as does charcoal to wood The preparation of coke in beehive ovens results in the loss of volatile by-products Only a small amount is still made by this method For industrial purposes, coke is prepared in retorts or furnaces of silica brick, and the by-products (chiefly ammonia, coal tar, and gaseous compounds) are saved Petroleum coke is the solid residue left by the cracking process of oil refining Natural coke, or carbonite, is formed by METAMORPHISM from bituminous coal when intrusive igneous rock cuts across a vein of coal

cola or **kola**, tropical tree (genus *Cola*) of the family Sterculiaceae (STERCULIA family), native to Africa but now grown in other tropical regions The fruit is a pod containing seeds from which is obtained CAFFEINE, an essential oil Cola nuts are chewed as a stimulant by the native population and are exported for commercial use in soft drinks and medicines Colas are classified in the division MAGNOLIOPHYTES, class Magnoliopsida, family Sterculiaceae

Colatina (kōōlatē'na), city (1970 pop 105,157), Espírito Santo state, E central Brazil, on the Doce River The state's chief agricultural center, Colatina is one of the leading coffee producers of Brazil

Colbert, Charles: see CROISSY CHARLES COLBERT, MARQUIS DE

Colbert, Claudette (klōdēt' kōlbēr'), 1905-, American movie actress, b Paris, France, her original name was Claudette Chauchoin Distinguished by her rosy cheeks, hearty laugh, and curly bangs, Colbert is particularly adept at sophisticated comedy Her films include *It Happened One Night* (1934), *Private Worlds* (1935), *Since You Went Away* (1944), and *Parrish* (1961) She has often appeared on the stage

Colbert, Jean Baptiste (zhaN batēst'), 1619-83, French statesman The son of a draper, he was trained in business and was hired by Cardinal MAZARIN to look after his financial affairs On his deathbed, Mazarin recommended Colbert to King Louis XIV, who made him comptroller general of finances (1665) Colbert helped to procure the downfall of the superintendent of finances, Nicolas FOUQUET, for mismanagement As Louis XIV's minister, Colbert scaled down the public debt by repudiating some obligations and reducing the value of others and set up a system of accounts in order to keep the government within its income His efforts to make taxes more equal had little success in the face of localism and tradition Colbert's aim was to make France economically self-sufficient One of the most successful practitioners of MERCANTILISM, he encouraged the growth of industry through subsidies and tariff protection, rigidly regulated the qualities and prices of manufactured and agricultural products, tried to break down trade barriers within France, initiated a vigorous road-building program, and restricted the use of natural resources In 1669 he was made secretary of state for naval affairs He constructed shipyards, arsenals, and harbors, among them Brest and Rochefort, and began the construction of a large navy as a first step in the development of commerce and colonization Colbert contributed significantly to the splendor of Louis XIV's reign by patronizing the arts and sciences He founded the Academy of Sciences and the Paris Observatory and promoted the French Academy His efforts at economy were soon menaced by the extravagance of the king, and the opening of Louis XIV's wars began the decline of Colbert's power and the ascendancy of the marquis de LOUVOIS It was Colbert's commercial policy, however, that, by challenging Dutch commercial strength, contributed to the DUTCH WAR of 1672-78 To meet military expenses, Colbert was obliged to resort to increased taxation, the sale of offices, borrowing, and the anticipation of future revenues His new taxes caused serious disturbances Despite his unpopularity at the time of his death, Colbert was

later ranked among the greatest of French statesmen See E C Lodge, *Sully, Colbert and Turgot* (1931, repr 1970), C W Cole, *Colbert and a Century of French Mercantilism* (1939)

Colborne, John: see SEATON, JOHN COLBORNE, 1ST BARON

Colby, Bainbridge, 1869-1950, U S lawyer and public official, b St Louis Upon graduation (1891) from Columbia law school, he began law practice in New York City and became active in Republican politics He left the party with Theodore Roosevelt (1912) to found the National Progressive party During World War I he served on the U S Shipping Board and he became (March, 1920) Secretary of State in President Wilson's cabinet He became a close confidant of Wilson, with whom he practiced law (1921-22) after Wilson's term of office ended See his *Close of the Wilson Administration and the Final Years* (1930)

Colby College, at Waterville, Maine, coeducational, est 1813, opened 1818 The school, principally a liberal arts college, adopted its present name in 1899 Its library includes the papers of Edwin Arlington Robinson

Colchester (kōl'chēstər, -chēs'tər), municipal borough (1971 pop 76,145), Essex, SE England, on the Colne River It is a grain and cattle market The oyster fisheries of the Colne are important, an annual event is the October oyster feast Other industries are flour milling, malting, and the making of boilers, gas engines, shoes, and farm machinery Colchester was one of the great cities of pre-Roman Britain, the capital of the ruler Cunobelin (Shakespeare's Cymbeline) It became an important Roman colony and was the particular object of attack (A D 61) by Boadicea To the Anglo-Saxons the place was known as Colneceaster The WITENAGEMOT met there in 931 During the ENGLISH CIVIL WAR the town was taken (1648) after a long siege by parliamentarians under Baron Fairfax of Cameron Of interest are the Roman walls (more completely preserved than elsewhere in England) and the massive Norman castle, part of which houses a museum of Roman antiquities Colchester has a military base

colchicine (kōl'chēsēn'), alkaloid extracted from plants of the genus *Colchicum* and especially from the corms of the autumn crocus, *Colchicum autumnale* (see MEADOW SAFFRON) The metabolic effect of colchicine is not known, but it is thought that it may decrease production of lactic acid and prevent accumulation of uric acid crystals in the body, making it useful in the treatment of gout Colchicine and derivatives such as demecolcine inhibit MITOSIS, or cell division As a mitotic poison, it inhibits rapidly proliferating cells and has been used in cancer therapy and as an IMMUNOSUPPRESSIVE DRUG Colchicine has also been used to visualize chromosomes photomicrographically and to induce mutations experimentally

Colchis (kōl'kīs), ancient country on the eastern shore of the Black Sea and in the Caucasus region Centered about the fertile valley of the Phasis River (the modern Rion), Colchis corresponds to the present-day region of Mingrelia in the Georgian SSR In Greek legend it was the home of Aeetes and Medea, the land where the Golden Fleece was sought by JASON and the Argonauts Greek trading posts were established in Colchis, but the land remained independent until conquered (c 100 B C) and held briefly by Mithradates VI of Pontus After the time of Trajan to the end of the Roman Empire, Rome exerted considerable influence on the region

cold, common, catarrhal infection of the upper respiratory tract sometimes confined to the mucous membrane of the nose, at other times involving that of the throat and larynx as well The cold is the most common human ailment, most Americans suffer from one to three colds per year, children from the ages of one to five being the most susceptible group Although the incidence of colds is higher in winter, exposure to chilling or dampness is considered to be of little significance Colds are frequently accompanied by fever and usually general discomfort The causative agent may be one of 50 to 60 viruses, called rhinoviruses, to which, it seems, almost no one is immune The congested and discharging mucous membrane may become a fertile ground for a secondary bacterial invasion that may spread to the bronchi and lungs or to the ears, sinuses, or mastoid processes There is as yet no known cure or preventive for the common cold, although some are of the opinion that large doses of VITAMINS, especially vitamin C, may be helpful preventives Treatment involves adequate intake of fluids to prevent dehydration and aspirin to relieve pain and fever When necessary, nasal sprays are

used to shrink swollen membranes and syrups to treat severe coughs. Antibiotics are used only in treatment and prevention of secondary bacterial infection. Uncomplicated infections usually last from three to ten days.

Colden, Cadwallader (kōl'dən), 1688–1776, colonial scholar and political leader of New York, b. Ireland, of Scottish parents. After studying medicine in London, Colden arrived (1710) in Philadelphia to practice. He moved (1718) to New York, where he was appointed (1720) surveyor general. He was named (1721) to the governor's council and became increasingly influential during the administration of George Clinton (1686–1761), the colonial governor, whose official papers and addresses Colden in large part prepared. After 1761 he was lieutenant governor of New York, and he became more and more unpopular among the radicals opposed to the British measures. In his 55 years of active public life, Colden was able to make himself one of the most learned men in the colonies. He studied Newton's principles and wrote his own critique, *The Principles of Action in Matter* (1751). He became a botanist of the new Linnaean system of classifying flora (as did his daughter, Jane Colden) and made significant contributions to the medical literature of the colonies. He also published his *History of the Five Indian Nations* (1727), a valuable source on the Iroquois tribes. His letter books (1877–78) and letters and papers (7 vol., 1918–23) were published by the New-York Historical Society. See biography by A. M. Keys (1906, repr. 1971).

cold frame, in horticulture, sun-heated board frame covered with a removable top of glass or other transparent material and sunk into the ground. The top may be solid or slatted or screened for shade. The cold frame is used to start seedlings in early spring (four to six weeks before the average frost-free date), to harden seedlings or plants removed from greenhouses or hotbeds, and to protect plants during the winter. A **HOTBED** is an artificially or naturally heated cold frame.

cold sore* see **HERPES SIMPLEX**

cold storage* see **REFRIGERATION**

Coldstream, burgh (1971 pop. 1,270), Berwickshire, SE Scotland, on the English border. General Monck raised troops there in 1660 for his march into England that resulted in the restoration of Charles II to the throne. The regiment became known as the Coldstream Guards, one of the regiments of guards of the royal household. Coldstream, like Gretna Green, was a marriage resort from 1754 to 1856. In 1975, Coldstream became part of the Borders region.

cold type, any method of preparing matter for PRINTING that employs a typewriter, a special keyboard machine, or photocomposition rather than the metal (hot type) used in letterpress composition. Reproduction is usually by a photographic process.

cold war, term used to describe the shifting struggle for power and prestige between the Western powers and the Communist bloc from the end of World War II until the early 1960s. Of worldwide proportions, the conflict was tacit in the ideological differences between COMMUNISM and capitalist DEMOCRACY. Mutual suspicion had long existed between the West and the USSR, and friction was sometimes manifest in the Grand Alliance during World War II. After the war the West felt threatened by the continued expansionist policy of the Soviet Union, and the traditional Russian fear of incursion from the West continued. Communists seized power in Eastern Europe with the support of the Red Army, the Russian occupation zones in Germany and Austria were sealed off by army patrols, and threats were directed against Turkey and Greece. Conflict sometimes grew intense in the UNITED NATIONS, which was at times incapacitated by the ramifications of the cold war, at others effective in dealing with immediate issues. In a famous speech (1946) at Fulton, Mo., Sir Winston Churchill warned of an implacable threat that lay behind a Communist "iron curtain." The United States, taking the lead against the expansion of Soviet influence, rallied the West with the Truman Doctrine, under which immediate aid was given to Turkey and Greece. Also fearing the rise of Communism in war-torn Western Europe, the United States inaugurated the European Recovery Program, known as the MARSHALL PLAN, which helped to restore prosperity and influenced the subsequent growth of the European Community. During the cold war the general policy of the West toward the Communist states was to contain them (i.e., keep them within their current borders) with the hope that internal division, failure, or evolution might end their threat. In 1948 the Soviet Union directly

challenged the West by instituting a blockade of the western sectors of Berlin, but the United States airlifted supplies into the city until the blockade was withdrawn (see **BERLIN AIRLIFT**). The challenges in Europe influenced the United States to reverse its traditional policy of avoiding permanent alliances, in 1949 the United States and 11 other nations signed the North Atlantic Treaty (NATO, see **NORTH ATLANTIC TREATY ORGANIZATION**). The Communist bloc subsequently formed (1955) the **WARSAW TREATY ORGANIZATION** as a counterbalance to NATO. Meanwhile, in Asia, the Communist cause gained great impetus when the Communists under MAO TSE-TUNG gained control of mainland China in 1949. The United States continued to support Nationalist China, with its headquarters on Taiwan. President Truman, fearing the appeal of Communism to the peoples of Asia, Africa, and Latin America, created the Point Four program, which was intended to help underdeveloped areas. Strife continued, however, and in 1950 Communist forces from North Korea attacked South Korea, precipitating the **KOREAN WAR**. Chinese Communist troops entered the conflict in large numbers, but were checked by UN forces, especially those of the United States. The focus of the cold war in Asia soon shifted to the southeast. China supported insurgent guerrillas in Vietnam, Laos, and Cambodia, the United States, on the other side, played a leading role in the formation of the **SOUTHEAST ASIA TREATY ORGANIZATION** and provided large-scale military aid, but guerrilla warfare continued. The newly emerging nations of Asia and Africa (see **AFRO-ASIAN BLOC**) soon became the scene of cold-war skirmishes, and the United States and the Soviet Union (and later China) competed for their allegiance, often through economic aid, however, many of these nations succeeded in remaining neutral. Hopes for rapprochement between the Soviet Union and the West had been raised by a relaxation in Soviet policy after the death (1953) of Joseph STALIN. Conferences held in that period seemed more amiable, and hopes were high for a permanent ban on nuclear weapons. However, the success of the Soviet artificial satellite Sputnik in 1957, attesting to Soviet technological know-how, introduced new international competition in space exploration and missile capability. Moreover, both Soviet Premier Nikita KHRUSHCHEV and U.S. Secretary of State John Foster Dulles grimly threatened "massive retaliation" for any aggression, and the Soviet Union's resumption (1961) of nuclear tests temporarily dashed disarmament hopes. While Khrushchev spoke of peaceful victory, extremists in both camps agitated for a more warlike course, even at the risk of nuclear catastrophe. China began to accuse the USSR of conciliatory policies toward the West, and by the early 1960s ideological differences between the two countries had become increasingly evident. The cold-war struggle continued in Southeast Asia, in the Middle East (see **CENTRAL TREATY ORGANIZATION**), in Africa (see **ZAIRE**), in Latin America (where the United States supported the **ALLIANCE FOR PROGRESS** to counter leftist appeal), and in Europe, where the East German government erected the **BERLIN WALL** in late 1961 to check the embarrassing flow of East Germans to the West. In 1962 a tense confrontation occurred between the United States and the Soviet Union after U.S. intelligence discovered the presence of Soviet missile installations in Cuba. Direct conflict was avoided, however, when Premier Khrushchev ordered ships carrying rockets to Cuba to turn around rather than meet U.S. vessels sent to intercept them (see **CUBAN MISSILE CRISIS**). It was obvious from this and other confrontations that neither major power would risk nuclear war. Meanwhile, during the late 1950s and early 60s both European alliance systems began to weaken somewhat, in the Western bloc, France began to explore closer relations with Eastern Europe and the possibility of withdrawing its forces from NATO. In the Soviet bloc, Rumania took the lead in departing from Soviet policy. U.S. involvement in the Vietnam War in Southeast Asia led to additional conflict with some of its European allies and diverted its attention from the cold war in Europe. All these factors combined to loosen the rigid pattern of international relationships that was responsible for the cold war, and it appeared to have ended. See D. F. Fleming, *The Cold War and Its Origins, 1917–1960* (1961), J. A. Lukacs, *A New History of the Cold War* (3d ed. 1966), T. W. Wilson, Jr., *Cold War and Common Sense* (1962), Gabriel Kolko, *The Politics of War* (1968), J. L. Gaddis, *The United States and the Origins of the Cold War, 1941–1947* (1972).

Coldwell, Major James William, 1888–1974, Canadian political leader, b. England. He went to Canada

in 1910 and became a school administrator in Regina, Sask. He was a leader of the province's Farmer-Labour party (1932–35) and helped to found the Co-operative Commonwealth Federation (CCF, see **NEW DEMOCRATIC PARTY**), a leftist party. As the CCF candidate, Major (his given name) Coldwell was elected (1935) to the Canadian House of Commons. He was a Canadian delegate to the San Francisco conference in 1945 and to the UN General Assembly in 1946. He became parliamentary leader of his party in 1940 and national president in 1942, holding both posts until 1960. When the New Democratic party was formed in 1961, he became its honorary president. His *Left Turn, Canada* (1945) discusses the CCF's objectives.

Cole, George Douglas Howard, 1889–1959, English economist, labor historian, and socialist. Educated at Oxford, he was long associated with the university and held a professorship from 1944 to 1957. For many years a leading exponent of **GUILD SOCIALISM**, he later returned to his original Fabianism, acting as chairman of the Fabian Society from 1939 to 1946 and becoming its president in 1952. His many books, mainly on labor and socialism, range from popular works to scholarly studies. Among his original works of enduring value are *A Short History of the British Working Class Movement* (3 vol., 1927, rev. ed. 1948), *The British Common People* (with Raymond W. Postgate, 1939, rev. ed. *The British People*, 1947), and *A History of Socialist Thought* (5 vol. in 7, 1953–60). See biography by L. P. Carpenter (1973). With his wife, Margaret Isabel (Postgate) Cole, 1893–, he wrote over 30 detective stories as well as works on economics and politics. Her works include *Beatrice Webb* (1945), *The Story of Fabian Socialism* (1961), and a biography of her husband (1971). She edited Beatrice Webb's important diaries.

Cole, Margaret Isabel (Postgate)* see **COLE, GEORGE DOUGLAS HOWARD**

Cole, Thomas, 1801–48, American landscape painter, b. England. He arrived in the United States in 1818 and moved to Ohio, where he was impressed by the beauty of the countryside. In 1825 he went to New York, where his landscape paintings began to be appreciated. Largely self-taught, he depicted the scenery of the Hudson River valley and the Catskills, which he discovered on long walking trips, becoming a leader of the **HUDSON RIVER SCHOOL**. In 1829 he went to Europe, where he spent some time sketching in England and Italy. In Paris he greatly admired the landscapes of Claude Lorrain. After he returned to New York, he was commissioned (1832) to paint his five famous allegorical scenes, farfetched and neoclassical in style, known as the *Course of Empire* (N.-Y. Historical Soc., New York City). This series and the *Expulsion from the Garden of Eden* (Mus. of Fine Arts, Boston) reflect his strong moralizing tendencies, combined with elements of fantasy, they are far less successful than his landscapes. Other works, such as *Oxbow* (Metropolitan Mus.) and *Catskill Mountains* (Mus. of Art, Cleveland), reveal his joy in the grandeur of nature. See biography by L. L. Noble (1964).

Cole, Timothy, 1852–1931, American wood engraver, b. London. He came to the United States as a child. Cole learned his trade in Chicago and later moved to New York, where in 1873 he began his 40-year association with the *Century Magazine* (then *Scribner's*). He was a pioneer and consummate craftsman in the white line technique of wood engraving, which allowed a more faithful reproduction of the works of European masters and popular contemporary painters. *Dutch and Flemish Masters* (1901) is one of the books that he engraved.

Coleraine (kōl'rān'), municipal borough (1971 pop. 14,871), Co. Londonderry, N. Northern Ireland, near the mouth of the Bann River. Coleraine is a port. Its industries include distilling, linen milling, the curing of ham and bacon, bog iron mining, and salmon fishing. There is also a large chemical fiber plant. In 1613, James I gave the site of the town to the corporations of the City of London for development.

Coleridge, Hartley (kōl'rīj), 1796–1849, English author, eldest son of Samuel Taylor Coleridge. Reared in the household of the poet Southey after the estrangement of his parents, Hartley Coleridge went to Oxford and gained a fellowship at Oriel. His shy and melancholy nature, however, curtailed a very promising university career. He was dismissed from Oriel for intemperance and went to London. There he wrote and tutored private pupils. His *Biographia Literaria*, a series of very sound critical biographies, appeared in 1833. The same year he published a small volume of poems, including some beautiful

sonnets, which established his literary reputation. Shortly thereafter, he retired to the Lake District, where he remained until his death. In 1840 he edited the dramatic works of Massinger and Ford. His brother Derwent published the remainder of his literary works in 1851. See his letters (ed. by E. L. Griggs and G. E. Griggs, 1936), biography by Lawrence Hanson (1939, repr. 1962).

Coleridge, Samuel Taylor, 1772–1834, English poet and man of letters, b. Ottery St. Mary, Devonshire, one of the most brilliant, versatile, and influential figures in the English romantic movement. Son of a clergyman, he was a precocious, dreamy child. He attended Christ's Hospital school in London and was already formidably erudite upon entering Cambridge in 1791. His erratic university career was interrupted by his impulsive enlistment in the dragoons, from which his brothers managed to extricate him. In 1794 he met the poet Robert Southey, who shared his political and social idealism, and together they planned to establish a small utopian community, which they called a pantisocracy, on the banks of the Susquehanna River in the United States. The plan failed to materialize for practical reasons. In 1795, Coleridge married Sarah Fricker, the sister of Southey's fiancée, with whom he was never happy. They settled in Nether Stowey in 1797, and shortly thereafter William Wordsworth and his sister Dorothy moved into a house nearby. Although Coleridge had been busy and productive, publishing both poetry and much topical prose, it was not until his friendship with Wordsworth that he wrote his best poems. In 1798, Coleridge and Wordsworth jointly published the volume *Lyrical Ballads*, whose poems and preface made it a seminal work and manifesto of the romantic movement in English literature. Coleridge's main contribution to the volume was the haunting, dreamlike ballad "The Rime of the Ancient Mariner." This long poem, as well as "Kubla Khan" and "Christabel," written during the same period, are Coleridge's best-known works. All three poems make use of exotic images and supernatural themes. "Dejection: An Ode," published in 1802, was the last of Coleridge's great poems. It shows the influence of (or affinity to) some poetic ideas of Wordsworth, notably the meditation upon self and nature and upon the relationships among emotion, sense experience, and understanding. While an undergraduate Coleridge had begun to take laudanum (an opium derivative then legal and widely used) for his ailments, and he was addicted by about 1800. That year, after having traveled with Wordsworth in Germany, Coleridge moved with his family to Keswick in the Lake District. He continued his studies and writings on philosophy, religion, contemporary affairs, and literature. In 1808 he separated from his wife permanently, and from 1816 until his death he lived in London at the home of Dr. James Gilman, who brought his opium habit under control. Coleridge worked for many years on his *Biographia Literaria* (1817), containing accounts of his literary life and critical essays on philosophical and literary subjects. It presents Coleridge's theories of the creative imagination, but its debt to other writers, notably the German idealist philosophers, is often so heavy that the line between legitimate borrowing and plagiarism becomes blurred. This borrowing tendency, evident also in some of his poetry, together with Coleridge's notorious inability to finish projects—and his proposal of impractical ones—made him a problematic figure. His lifelong friend Charles Lamb called him a "damaged archangel." Indeed, 20th-century editorial scholarship has unearthed additional evidence of plagiarism, thus, Coleridge is still a controversial figure. However, the originality and beauty of his best poetry and his enormous influence on the intellectual and aesthetic life of his time is unquestioned. He was reputedly a brilliant conversationalist, and his lectures on Shakespeare remain among the most important statements in literary criticism. His *Confessions of an Enquiring Spirit* (ed. by his nephew H. N. Coleridge) was published posthumously in 1840. See his collected letters, ed. by E. L. Griggs (6 vol., 1956–71), *Notebooks 1794–1808*, ed. by Kathleen Coburn (4 vol., 1957–61), collected works, ed. by Kathleen Coburn (5 vol., 1969–72), biographies by E. K. Chambers (1938), Lawrence Hanson (1938, repr. 1962), and W. J. Bate (1968), studies by I. D. Campbell (1894), Carl Woodring (1961), Marshall Suther (1965), and Norman Fruman (1972), J. L. Lowes, *The Road to Xanadu* (rev. ed. 1964), R. L. Brett, ed., *Coleridge* (1973). His daughter, Sara Coleridge, 1802–52, has literary standing in her own right. Her translation of *An Account of the Abipones* (1822) shows a great facility in both Latin and

English. Her best work is *Phantasmion* (1837), a fairy tale. See her *Memoir and Letters* (1873, repr. 1974), biography by E. L. Griggs (1941, repr. 1973).

Coleridge-Taylor, Samuel, 1875–1912, English composer, son of a Negro physician of Sierra Leone and an Englishwoman. He studied violin and composition at the Royal College of Music in London. He wrote many songs, orchestral works, piano pieces, and some chamber music but is best known for his cantatas, particularly the *Hiawatha* trilogy (1898–1900) and *A Tale of Old Japan* (1911). See J. F. Coleridge-Taylor, *Genius and Musician* (1943).

Colet, John (kō'let), 1467?–1519, English humanist and theologian. While studying on the Continent (1493–96), Colet became interested in classical scholarship and in theories of education. After his residency at Oxford as a lecturer, in 1505 he became dean of St. Paul's Cathedral, London. He planned the new St. Paul's School (1509) and endowed it from his private fortune. With William Lily, the school's first headmaster, and Erasmus, he collaborated on a Latin grammar that was later called the Eton grammar and used by generations of schoolboys. Colet did not, himself, break with the Roman Church, but his ideas on church reform were influential later. Most of his writings were unpublished until the late 19th cent. See biography by J. H. Lupton (2d ed. 1961), Frederic Seebohm, *The Oxford Reformers* (1913, repr. 1971).

Colette (Sidonie Gabrielle Colette) (sēdōnē' gābrēēl' kōlēt'), 1873–1954, French novelist. Colette gained wide fame with her numerous novels, characterized by their sensitive observations—particularly of women—and their intimate, semiautobiographical style. Her early series of novels, published in collaboration with her first husband, Willy (pseud. of Henry Gauthier-Villars), include *Claudine at School* (1900, tr. 1930) and *The Innocent Wife* (1903, tr. 1934). Among many later novels written on her own are *The Vagant* (1910, tr. 1912), *Chéri* (1920, tr. 1929), *The Cat* (1933, tr. 1936), and *Gigi* (1945). After being divorced in 1906, Colette worked on the music-hall stage until 1914. Her marriage to Henri de Jouvenel also ended in divorce, but her last years were enriched by the companionship of her third husband, Maurice Goudekot. Colette was the first woman to be president of the Goncourt Academy and the second to be made a grand officer of the French Legion of Honor. See *Earthly Paradise*, a collection of her autobiographical writings, ed. by Robert Phelps (1966), biographies by Maria Le Hardouin (tr. 1958), Margaret Davies (1961), and Margaret Crosland (1973), studies by Elaine Marks (1960) and R. D. Cottrell (1974).

coleus, common name for a genus of plants with large colorful leaves native to tropical Asia and Africa. Several species are grown as houseplants. Plants of the genus *Coleus* are in the family Labiatae (MINT family).

Colfax, Schuyler (skī'lər kōl'fäks), 1823–85, Vice President of the United States (1869–73), b. New York City. He moved in boyhood to Indiana. First a Whig editor, he later helped to organize the Republican party in Indiana. He served in the U.S. House of Representatives (1855–69), being speaker from 1863 to 1869. In 1868 he was elected Vice President under Ulysses S. Grant. Colfax was involved in the CREDIT MOBILIER OF AMERICA scandal, which ended his political career. See biography by W. H. Smith (1952).

Colgate, William (kōl'gāt), 1783–1857, American manufacturer and philanthropist, b. England. Arriving as a youth in the United States in 1795, Colgate learned candlemaking in Baltimore and New York. In 1806 he set up a tallow factory in New York and later engaged in soapmaking. In 1847 he moved his factory to Jersey City and by 1850 began producing fancy soaps and toilet preparations. He helped organize several Bible societies, including the American Bible Society (1816), and contributed amply to the institution later called Colgate Univ.

Colgate University, at Hamilton, N.Y., primarily for men, chartered 1819, opened 1820 as Hamilton Literary and Theological Institution, a Baptist seminary, renamed Madison Univ. 1846, assumed present name 1890. Colgate is principally a liberal arts college.

Col-hozeh (kōl-hō'zē), Judahite of Nehemiah's time. Neh. 3:15, 11:5.

colic, intense pain caused by spasmodic contractions of one of the hollow organs, e.g., the stomach, intestine, gall bladder, ureter, or oviduct. The cause of colic is irritation, and the irritant may be a stone (as in the gall bladder or ureter), an irritant food or gas (in the stomach and intestines), appendicitis, or

implantation of an embryo in an oviduct. Intestinal colic in infancy is sometimes attributed to gas formed by excessive swallowing of air or inadequate digestion of milk. Treatment of colic is relative to the cause.

Coligny, Gaspard de Châtillon, comte de (gāspar' də shātēyōn' kōnt də kōlēnyē'), 1519–72, French Protestant leader. A nephew of Anne, duc de MONTMORENCY, he came to the French court at an early age. He distinguished himself at Ceresole (1544) in the Italian Wars, was promoted colonel general of infantry, and in 1552 became admiral of France. He organized two unsuccessful colonies (1555, 1562) in the New World (see RIO DE JANEIRO, RIBAUT, JEAN). In 1557 he defended Saint-Quentin against the Spaniards, but he was taken prisoner and was not released until 1559. In the same year he made public profession of his conversion to Protestantism. He argued for the Protestant cause with CATHERINE DE' MEDICI at the time of the conspiracy of Amboise (1560, see AMBOISE CONSPIRACY OF). With Louis I de CONDÉ he commanded the Huguenots (French Protestants) after the murder of Protestants at Vassy (1562) and also in the second of the Wars of Religion (1567–68). An unsuccessful attempt to capture Coligny and Condé at Noyers (1568) brought on the third war, in which Coligny became sole leader nominally as adviser to the young Henry of Navarre (later King HENRY IV of France). Defeated at Moncontour, he was victor at Arnay-le-Duc (1570) and negotiated the Treaty of Saint-Germain (1570). Reconciled with Catherine and King CHARLES IX (1571), he became the king's favorite adviser. To weaken Catholic Spain he proposed that France aid the Low Countries, which were in rebellion against Spanish rule. Catherine, alarmed at the possibility of war with Spain, also feared that Coligny's increasing influence would weaken her own hold on the king. On Aug. 22, 1572, Coligny escaped the assassination ordered by Catherine and by Henri de GUISE, two days later, however, he was murdered in the massacre of Huguenots instigated by Catherine (see SAINT BARTHOLOMEW'S DAY, MASSACRE OF). See Sir Walter Besant, *Gaspard de Coligny* (1879), Eugene Bersier, *Coligny: The Earlier Life of the Great Huguenot* (1884).

Colima (kōlē'ma), state (1970 pop. 240,235), 2,010 sq mi (5,206 sq km), SW Mexico, on the Pacific Ocean. The capital is COLIMA, the port is MANZANILLO. The smallest in population and one of the smallest in area of the Mexican states, Colima is wedged between Jalisco, which nearly surrounds it, and Michoacán. It includes the islands of Revilla Gígedo off the coast. Most of the state lies within the cool highlands of the Sierra Madre Occidental. The smoking volcano, Colima (12,631 ft/3,850 m high), and the neighboring peak, Nevado de Colima (14,235 ft/4,339 m high), are just across the border in Jalisco. Cotton, sugarcane, and rice grow on tropical plains along Colima's coast, and some of Mexico's finest coffee is cultivated on the mountain slopes. Livestock raising is an important occupation. Iron, copper, and some gold are mined in Colima. The state's economic development has been hindered by inadequate communications. Once part of the ancient Aztec kingdom of Colima, the region was conquered by the Spanish in the 16th cent. Wars between conservative and liberal forces during the 19th cent. brought much fighting to the state.

Colima, city (1970 pop. 64,851), capital of Colima state, SW Mexico. It is a marketing and processing center for the surrounding agricultural region. The city was founded in 1523 by the Spanish explorer Gonzalo de Sandoval.

Colin, Alexander: see COLINS, ALEXANDER.

Colines, Simon de (sēmōn' də kōlēn'), d. 1546, Parisian printer. He was associated with the elder Henri ESTIENNE and continued his work. Colines used elegant roman and italic types and a Greek type, with accents, that was superior to its predecessors. He is believed to have designed some of his types, some were designed by Geoffroy TORRY. His books, often small in format, are superbly crafted.

Colins, Colin, or Colyn, Alexander (alēksa'n'drə kōlān'), c. 1527–1612, Flemish sculptor. He brought European court mannerism to Germany, where he directed the sculpture on the Ottheinrichsbau (1562) in Heidelberg. He designed the sculpture for the tomb of Ferdinand II and executed most of the reliefs in marble on the tomb of Maximilian I, both at Innsbruck.

Coliseum: see COLOSSEUM.

collage (kalāzh', kō-), [Fr., =pasting], technique in art consisting of cutting and pasting natural or manufactured materials to a painted or unpainted

surface—hence, a work of art in this medium. The art of collage was initiated in 1912 when Picasso pasted a section of commercially printed oldcloth to his cubist painting, *Still Life with Chair Caning* (Mus. of Modern Art, New York City). Collage elements appear in works by Gris, Braque, Malevich, Dove, and the futurist artists. A basic means of Dada and surrealist art, it was used by Arp, Schwitters, and Ernst. Collage is related to the newer art of assemblage, in which the traditional painted canvas has been abandoned in favor of the assembling of bits of material, which are sometimes additionally painted or carved. See studies by Harriet Janis and Rudi Blesh (rev. ed. 1967), Herta Wescher (1968, tr. 1971), and Norman Laliberté (1972).

collagen (kōl'ajən), any of a group of proteins found in skin, ligaments, tendons, bone and cartilage, and other CONNECTIVE TISSUE. Collagen is composed of groups of white inelastic fibers with great tensile strength. These fibers are made up of fine fibrils, which are in turn composed of even finer filaments, visible through the electron microscope. Collagen protein contains an unusually high percentage of the amino acids PROLINE and hydroxyproline. X-ray diffraction studies provide evidence that the protein is a coiled chain with periodic, i.e., repeating, arrangement of its amino acids. Cartilage is composed of fibrous collagen in an amorphous gel. The organic (nonmineral) content of bone is made up largely of collagen fibers with calcium salt crystals lying adjacent to each segment of the fiber, the fibers and salt crystals combined form a structure with compressional and tensile strength comparable to that of reinforced concrete. A group of diseases, often termed collagen, or connective tissue, diseases, involve a variety of alterations in the connective tissue fibers, rheumatoid arthritis, rheumatic fever, lupus, and scleroderma are included in this group. Some of these diseases may involve an autoimmune response, in which the immune mechanism injures or destroys the individual's own tissues (see IMMUNITY). Collagen dissolved in boiling water becomes denatured to form GELATIN.

collagen disease: see AUTOIMMUNE DISEASE, COLLAGEN.

collar, decorative strip on the neckline of a garment, modified necklace. Metal circlets, usually twisted, known as torques date from the Bronze Age and are worn by many primitive peoples. The Egyptians fashioned beaded yokes to wear as collars. In the 14th cent. neck chains called livery collars were worn as badges of alliance or fealty, neck chains were also worn as insignia of European orders of knighthood. The medieval gorget, or chin band, circled the neck and enveloped the throat, the habit of conservative orders of nuns retains this feature. Small ruffles began to appear at the neck and wrists c. 1530. The ruff, a circular fluted collar of starched linen, made its first appearance in Spain c. 1540. It later became a heart- or fan-shaped winglike extension that covered the back and shoulders and rose above the coiffure, it was made of fine linen or lace with matching cuffs and was often embroidered. The standing ruff gave way (c. 1635) to broad, falling collars of lace and later of linen. In the late 17th cent. neckcloths and cravats led the way to the stiff wing collar of the 1890s, to the clerical collar, and to the present-day fashion in ascots and neckties for men. Women's collars have varied widely from softly draped fichus and wide berthas to the high, tight collars of the 1890s. Modern collars are generally formed as inseparable parts of dresses and shirts.

collards: see KALE.

collateral, something of value given or pledged as security for payment of a loan. Collateral consists usually of financial instruments, such as stocks, bonds, and negotiable paper, rather than physical goods, although the latter may also be accepted as such. In case of default, the creditor may sell the collateral and apply the money thus acquired to payment of the debt, charging the debtor with any deficiency or crediting him with any surplus. The borrower may usually substitute other collateral for that held by the lender if it is acceptable to the latter. Such a privilege is particularly useful to borrowers who buy and sell securities. Merchandise collateral—such as negotiable warehouse receipts, bills of lading, and trust receipts—is also used, as is personal collateral, including deeds, mortgages, leases, and other rights in real estate. Other collateral may include bills of sale of movable goods, such as crops, machinery, furniture, and livestock, and savings-bank passbooks.

collect (kōl'ekt) [Lat. *lat*, = meeting], in Western liturgies, short prayer proper to an occasion, often

asking a particular favor. In the Roman Catholic Church the collect is said, typically, at Mass just before the epistle and at vespers. It occurs correspondingly in the Anglican and Lutheran liturgies. Many collects are very ancient, especially those of the Sundays and major feasts. Their language is terse. **collective bargaining**, in labor relations, procedure whereby an employer or employers agree to discuss the conditions of work by bargaining with representatives of the employees, usually a labor union. Its purpose may be either a discussion of the terms and conditions of employment (wages, work hours, job safety, or job security) or a consideration of the collective relations between both sides (the right to organize workers, recognition of a union, or a guarantee of no reprisals against the workers if a strike has occurred). The merits of collective bargaining have been argued by both opponents and proponents of the process, the former maintain that it deprives the worker of his individual liberty to dispose of his service, while the latter point out that without the union's protection the worker is subject to the dictation of the employer. As an essential process in labor relations, collective bargaining was first developed in Great Britain in the 19th cent. It has since become an accepted practice in most Western countries with a high level of industrialization. See Guy Farmer, *Collective Bargaining in Transition* (2 vol., 1967), M. S. Rukeyser, *Collective Bargaining* (1968), Russell A. Smith, *Collective Bargaining and Labor Arbitration* (1970), W. H. Hutt, *The Strike-Threat System* (1973).

collective farm, an agricultural producer's cooperative. No one definition fits all collective farms. They vary from nation to nation and also within nations. In the Soviet Union, Stalin in 1929 initiated widespread forced collectivization of agriculture. During that year agricultural land was ruthlessly confiscated, and small landowners were forced on pain of death or deportation to go into a kolkhoz [Rus., = collective farm]. By Feb., 1930, one half of the peasant farms had been collectivized. Widespread resentment of collectivization brought about some modification of the system under the Collective Farm Charter (1935). A mixed system of private and socialized enterprise was put into effect, and members of the collectives were permitted some individual property, including a plot of land and a few farm animals. By 1938 collectivization in the Soviet Union was almost complete, there were 240,000 kolkhozy holding 99.3% of formerly private land under cultivation. Prices paid for the agricultural products of the kolkhozy were set by the state, which also decreed what was to be grown. Collectivization had been instituted by Stalin to modernize agriculture, to secure a reliable food supply, to free capital for industrial production, and to release labor for heavy industry. The program was partly successful, although agricultural production is a continuing problem in the Soviet Union. In 1950, to tighten control over the collectives, a program of amalgamating them into larger units was begun. By 1972 the number of kolkhozy had been reduced from 254,000 to 32,300. The size of collective farms roughly tripled, and in 1972 the average collective had approximately 7,500 acres (3,000 hectares) under cultivation. In 1958 new agricultural measures, designed to woo the farmer-worker, abolished the system of requisition and substituted direct state purchases at higher prices. In 1969 the Collective Farmers' Congress met for the first time in 34 years. It approved new collective farm measures including the increase of the size of private plots, guaranteed income and a unified system of social insurance. In the '70s collective farmers were insured profits on various agricultural commodities as incentive for increased farm production. In the early 1970s, about half of the cultivated land in the U.S.S.R. was in collective farms, most of the rest was held by state farms. The commune of Communist China is similar to the collective farm in the Soviet Union. It is more strictly organized, embracing a wider range of activities, putting greater emphasis on collective living, and including nonagricultural workers. Collectivization of agriculture in Communist China began in 1955 and met little resistance. By 1956, 96% of all the households engaged in agriculture had been included in cooperatives. The system of cooperatives failed to free the labor and capital needed for industrial expansion, and in 1958 the commune system was established. Twenty to thirty cooperatives comprising over 20,000 members and 40 to 100 villages were merged into each commune. The land and equipment of the former cooperatives and any property and cash that the peasants had been permitted to withhold from the 1955 collectivization

became the property of the commune. An independent economic and administrative unit controlled the labor force and all means of production within each commune and provided central management of industry, commerce, education, agriculture, and military affairs. The workers performed both industrial and agricultural tasks and supported a complete military unit. They lived in communal buildings and took their meals as a community. They used communal nurseries, bathing facilities, barbershops, and similar service facilities. Wages and perquisites were controlled by the state, and all products were marketed through state agencies. By Jan. 1, 1959, 99% of all Chinese farm workers were members of a commune. The larger collective units, however, turned out to be less efficient in terms of management. This inefficiency, coupled with natural disasters and the effects of statistical misstatements made by the government, led in the early '60s to deemphasis in China on collective farming. Communes were decentralized, and in some instances land was broken up into private farms placing an emphasis on private incentive. The collective farms in Israel are of three kinds: the moshav ovdim, a worker's settlement, the kibbutz, a commune, the moshav shitufi, a modified collective. In all, the land, held in the name of the Jewish people by the Jewish National Fund, is rented on long-term lease at nominal fees. In the moshav ovdim each family works its own plot and retains any income from it. To hire labor is forbidden. Produce is marketed collectively, and consumer goods are bought collectively. In the kibbutz, best known of the collectives and most important economically, all property except specified personal possessions is collectively owned, planning and work are collective, and collective living is the rule. Work crews are headed by elected foremen. Work is exacted on the basis of ability, and goods distributed according to need. A biweekly town meeting is the final authority of the kibbutz. Elected officials implement the policy of the kibbutz and administer economic and social affairs. The 300-odd kibbutzim of Israel have combined in a number of federations expressive especially of ideological belief. Although only about 5% of Israel's population hold membership in the kibbutzim, they wield considerable political influence. The moshav shitufi, a late development in collectives in Israel, holds property communally, and its members work collectively. Community living is not required of members. Communal farming efforts have not proved markedly popular in North America, although numerous attempts have been and continue to be undertaken (see COMMUNE, COMMUNISTIC SETTLEMENTS). A noted exception is the agricultural-based colonies of Hutterites, who, as a result of persecution in central Europe, emigrated to South Dakota in 1874. They have increased in population and economic prominence to include some 20,000 members, living in over 200 separate colonies in the Dakotas, Montana, Minnesota, Washington, and the Canadian provinces of Alberta, Manitoba, and Saskatchewan. See Geoffrey Hudson et al., *The Chinese Commune* (1969), Elyahu Kanovsky, *The Economy of the Israeli Kibbutz* (1966), R. C. Stuart, *The Collective Farm in Soviet Agriculture* (1972).

Collège de France (kōlēzh' də frāNs), institution of higher learning founded in Paris, France, in 1529 by FRANCIS I at the instigation of Guillaume BUDÉ. It was founded to encourage humanistic studies and has always been independent of any university and free from supervision. Its lectures are open to the public without matriculation or fee. It gives no examinations and grants no certificates or degrees. Now its range of studies encompasses numerous humanistic and scientific fields. Its faculty includes many distinguished scholars.

College of Arms: see HERALD'S COLLEGE.

College of Physicians and Surgeons: see COLUMBIA UNIV.

College of the City of New York: see CITY COLLEGE, NEW YORK, CITY UNIV. OF.

College Park. 1 City (1970 pop. 18,203), Clayton and Fulton counties, NW Ga., a residential suburb of Atlanta, inc. 1891. Georgia Military Academy (1900) is there. 2 City (1970 pop. 26,156), Prince Georges co., W. central Md., a residential suburb of Washington, D.C., settled 1745, inc. 1945. It is the seat of the Univ. of Maryland, and its economy is centered on the university, research institutions, and electronics plants.

colleges and universities, institutions of higher education. Universities differ from colleges in that they are larger, have wider curricula, are involved in

research activities, and grant graduate and professional as well as undergraduate degrees. Universities generally consist of groups of schools, faculties, or colleges. They arose in the 12th and 13th cent as a means of providing further training in the professions of law, theology, and medicine, and as centers of study for the rediscovered works of Aristotle and the Arab scholars. Of the earliest universities, Salerno (9th cent) and Montpellier (13th cent) specialized in medicine, Bologna (1088) in law, and Paris (12th cent) in theology. Students and faculty were originally organized in guildlike groups. The student groups, known as "nations" and comprising students from particular localities, gradually diminished in power, however, as the faculty, by virtue of its control over teaching and graduation, became more powerful. In the Middle Ages, universities usually originated through royal or ecclesiastical initiative or through migrations of students from other universities. The migrations were sometimes influenced by political events. Oxford Univ., for example, was founded (12th cent) by English students from the Univ. of Paris who were forced to leave that institution as a result of conflicts between England and France; similarly, the university at Leipzig was founded (15th cent) by German scholars who were driven out of Prague by John Huss's Czech national movement. The medieval universities often had many thousands of students and played an important role in public affairs. Among the famous institutions founded were Salamanca (c 1230), Prague (1348), Vienna (1365), Uppsala (1477), Leiden (1575), and Moscow (1755). The oldest universities in the New World, both founded in 1551, are Mexico Univ. and San Marcos of Lima. In the 19th cent many governments reorganized and nationalized universities, as in Italy after unification (1870), in Spain (1876), and in France, where 17 autonomous regional universities were established after 1876. By 1900 many universities were secularized in administration and curriculum, and religious tests had been largely eliminated (in England by act of Parliament in 1871). Women have generally been admitted to universities since about 1870 (see COEDUCATION). In the United States, modern universities developed during the late 19th cent from the expansion of private colleges and the establishment of state tax-supported universities, largely as a result of the Morrill Act (1862), by which public lands were granted to the states for the formation and support of state agricultural and mechanical schools (see LAND GRANT COLLEGES AND UNIVERSITIES). Another important influence at that time was the founding of institutions (e.g., JOHNS HOPKINS UNIV.) devoted to graduate study and research. They were modeled on the German universities, with their separate graduate and professional schools each devoted to a particular area of study. In the 20th cent universities have played an increasingly important role in scientific and technical research, largely as a result of social and governmental demands for these services. The nationalization and bureaucratization of research functions has been especially marked in the United States, where various government agencies dispense large amounts of money to both public and private universities for research purposes. The federal government also provides direct aid to various categories of students, especially veterans. Since World War II there has been worldwide proliferation of new universities, expansion of old ones, and merging of small institutions into larger university systems. Educational reforms in Japan, for example, have decreed that there be at least one national university in each of 46 sections of the country, so that there are now more than 70 such institutions. The 1960s saw the establishment of seven new universities in Great Britain, while the period from 1948 to 1970 saw the State Univ. of New York grow from a small group of teacher training colleges into a multicampus system with more than 135,000 students.

Colleges Like universities, colleges first appeared in the Middle Ages, the earliest were founded in 12th-century Paris. Originally the college served as an endowed residence hall for university scholars, but later it absorbed much of the university's activity. It was in England, at Oxford and Cambridge, that the college became the principal center of learning, with the university serving mainly to examine candidates and confer degrees. The Industrial Revolution brought a demand for scientific and technical education, and separate technical colleges (e.g., Yorkshire Science College in Leeds) were founded. Moreover, extension lectures, sponsored by the universities, created a demand for educational centers in remote areas. Degrees, however, continued to be conferred by the universities with which the col-

leges were affiliated. It was in America that the liberal arts college first appeared extensively as a separate institution. In the 17th and early 18th cent, numerous colleges were established in the colonies, primarily to train young men for the ministry. Notable were Harvard (1636, Puritan), William and Mary (1693, Anglican), Yale (1701, Congregationalist), Princeton (1746, New Lights Presbyterian), Columbia (1754, Anglican), Brown (1765, Baptist), and Rutgers (1766, Dutch Reformed). By 1810 many small colleges had been established in the United States. Later in the same century a number of women's colleges were founded. Notable early women's colleges were Mt. Holyoke (1837), Elmira (1853), Vassar (1861), Wellesley (1871), Smith (1871), and Bryn Mawr (1881). Another development of the 19th cent was the growth of normal schools, which later became teachers colleges (see TEACHER TRAINING). Though the curricula and ideals of American colleges continued to be influenced by English schools, the American colleges, stimulated by the German university system and by the increasing demand for technical instruction, began to expand their facilities to include graduate and professional schools. By the 20th cent many American colleges had become universities, and by the middle of the century universities were giving out twice as many bachelor's degrees as were the traditional liberal arts colleges. In an attempt to reassert the importance of the colleges, many of them have been empowered to grant graduate degrees, especially the master's degree. The COMMUNITY COLLEGE movement has been important in expanding opportunities for higher education. OPEN ENROLLMENT has made college training available to a larger segment of high-school graduates. Still another innovation has been the establishment of cluster colleges, a number of specialized institutions clustered on one campus in order to provide the personalized education that is characteristic of the small college without sacrificing the quality and diversity of the university. The University of California at Santa Cruz (est 1965) has such a cluster-college system.

Colleges of the Seneca, The. see HOBART COLLEGE
College Station, city (1970 pop 17,676), Brazos co., E central Texas, in a livestock and cotton region, inc 1938. Texas Agricultural and Mechanical Univ. is there.

Colleoni, Bartolomeo (bartolōmē'ō kōl-lāō'nē), 1400-1475, Italian soldier of fortune. A CONDOTTIERE, Colleoni fought in the wars between Venice and Milan, often changing sides and distrusted by both. In 1454 he deserted Milan for the last time and became generalissimo of Venice, a post he held until his death. The beautiful Colleoni Chapel is in his native city, Bergamo, and the celebrated equestrian statue of him by VERROCCHIO is in Venice.

Collett, Camilla (Wergeland) (kamē'la vērg'ələn kōl'ēt), 1813-95, Norwegian novelist, sister of Henrik Wergeland. Her feminist novels include *The Governor's Daughters* (1854-55), the first Norwegian psychological novel, and the charming *In the Long Nights* (1862). She devoted her life and work to the emotional and social emancipation of women.

collie, breed of large, agile WORKING DOG developed in Scotland during the 17th and 18th cent. It stands from 22 to 26 in (55.9-66 cm) high at the shoulder and weighs from 50 to 75 lb (22.7-34 kg). There are two varieties of collie, it is thought that originally the rough-coated or long-haired type herded sheep in the tortuous climate of the northern Scottish hills while the less weatherproof smooth-coated collie drove cattle to market. Both varieties may be sable and white, blue merle, tricolored (black, tan, and white), or white. Although no thoroughly docu-

mented explanation of the origin of the collie's name is ever likely to be set forth, the following is probably the most reasonable. A type of sheep once found in the Scottish Highlands had black markings, either on the face or legs, and was called the "Colley" sheep. The dog that was bred and trained to herd these sheep was known as the "Colley dog," and, later, as the "collie." Today it is one of the most popular farm dogs and pets in the United States. See DOG.

Collier, Jeremy, 1650-1726, English clergyman. Collier was imprisoned as one of the NONJURORS, who refused to pledge allegiance to William III and Mary II. He later was outlawed (1696) for absolving on the scaffold two of those involved in the assassination plot against William. Collier's principal fame comes from his *Short View of the Immorality and Profaneness of the English Stage* (1698) and *Ecclesiastical History of Great Britain* (1708, 1714). In 1713 he was ordained a nonjuring bishop. See Anthony Rose, *The Jeremy Collier Stage Controversy* (1966).

Collier, John, 1884-1968, American social worker, anthropologist, and author, educated at Columbia and the College de France. After holding several positions in community organization and social work training, he became active in American Indian affairs. In 1922 Collier was editor of the magazine *American Indian Life* from 1926 until 1933, when he was appointed commissioner of Indian Affairs, a position he held for 12 years. In addition to works in verse, he wrote *Indians of the Americas* (1947) and *On the Gleaming Way* (1962, orig. pub 1949 as *Patterns and Ceremonials of the Indians of the Southwest*).

Collier, John Payne, 1789-1883, English critic, editor, and forger. The marginal notes and signatures supposedly discovered by him on original documents, especially those concerned with Shakespeare, were later exposed as having been forged by him while in the service of the duke of Devonshire. His authentic work included *A Bibliographical and Critical Account of the Rarest Books in the English Language* (1865) and the reprinting of early English tracts.

colligative properties, properties of a SOLUTION that depend on the number of solute particles present but not on the chemical properties of the solute. Colligative properties of a solution include freezing point (see FREEZING), BOILING POINT, osmotic pressure (see OSMOSIS), and solvent VAPOR PRESSURE. By measuring these properties and comparing them with the corresponding properties of the pure solvent, it is possible to determine the number of particles of solute present in the solution. If the mass of solute present is also known, the number-average MOLECULAR WEIGHT can be calculated by dividing the mass of solute by the number of particles present to obtain the average mass per particle.

Collingdale, borough (1970 pop 10,605), Delaware co., SE Pa., a suburb of Philadelphia, inc 1891.

Collingswood, borough (1970 pop 17,422), Camden co., SW N.J., settled 1682 by Quakers, inc 1888. It has some light industry.

Collingwood, Cuthbert Collingwood, Baron. see TRAFALGAR, BATTLE OF.

Collingwood, Robin George, 1889-1943, English philosopher and historian. From 1908 he was associated with Oxford as student, fellow, lecturer in history, and professor of philosophy. Collingwood believed that philosophy should be rooted in history rather than in formal science, and he attempted to correlate creative endeavor with historical experience rather than to sensation. He was also significant as a historian. In *Roman Britain* (1936) and in some 150 monographs he brilliantly reconstructed that ancient era from his study of coins and inscriptions. For his philosophical thought, see *Speculum Mentis* (1924), *An Essay on Philosophical Method* (1933), *Principles of Art* (1938), and *The Idea of History* (1946). See Alan Donagan, *The Later Philosophy of R. G. Collingwood* (1962), Lionel Rubinfeld, *Collingwood and the Reform of Metaphysics* (1970).

Collingwood, city (1971 pop 20,906), Victoria, SE Australia, a suburb of Melbourne. It has woolen and hosiery mills and footwear industries.

Collingwood, town (1971 pop 9,775), 5 Ont., Canada at the south end of Georgian Bay, an arm of Lake Huron. Collingwood has one of the largest shipbuilding plants and one of the largest dry docks on the Great Lakes.

Collins, Anthony, 1676-1729, English theologian, a friend of John Locke. He set forth the position of the deists and defended the cause of rational theology. His *Discourse of Free Thinking* (1713) was answered

by many clergymen and was satirized by Jonathan Swift. His *Philosophical Inquiry Concerning Human Liberty* (1715) is an excellent presentation of the determinist position, the theory that all events are determined by prior causes. See study by James O'Higgins (1970).

Collins, Edward Trowbridge, 1887–1951, American baseball player, b. Millerton, N.Y., grad. Columbia, 1907. One of the game's great second basemen, he was active in the American League for 25 years, playing with the Philadelphia Athletics (1906–14, 1927–30) and the Chicago White Sox (1915–26). During his major league career he stole 743 bases and made 3,313 base hits for a lifetime batting average of .333. Collins was elected to the National Baseball Hall of Fame in 1939.

Collins, Michael, 1890–1922, Irish revolutionary leader. He spent the years from 1907 to 1916 in England, during which period he joined the Fenian movement. He took part in the Easter Rebellion in Dublin in 1916 and was imprisoned for the rest of the year. One of the SINN FEIN members who set up the DAIL EIREANN in 1919, he led the Irish Republican Army in the guerrilla campaign against British rule that eventually forced the British government to sue for a truce. Although a convinced republican, Collins, with Arthur GRIFFITH, negotiated and signed the treaty (1921) that set up the Irish Free State (see IRELAND) because he felt it the best settlement with England possible at that time. He was finance minister in Griffith's government for a brief time before being assassinated by extremist republicans. See biographies by Frank O'Connor (1937), Rex Taylor (1958), Eoin Neeson (1968), Michael O'Donovan (rev. ed. 1969), and Margery Forester (1971).

Collins, Wilkie (William Wilkie Collins), 1824–89, English novelist. Although trained as a lawyer, he spent most of his life writing, producing some 30 novels. He is best known for two mystery stories, *The Woman in White* (1860) and *The Moonstone* (1868), which are considered the first full-length detective novels in English and among the best of their genre. He was a friend of Dickens, in whose periodical *Household Words* many of Collins's novels first appeared. See biographies by M. P. Davis (1956) and W. H. Marshall (1970).

Collins, William, 1721–59, English poet. He was one of the great lyricists of the 18th cent. While he was still at Oxford he published *Persian Eclogues* (1742), which was written when he was 17. Unstable and weak-willed, he never chose a profession and was constantly in debt until he inherited money from an uncle. He won no popularity during his lifetime, and his career was curtailed by insanity. A precursor of the 19th-century romantics, Collins wrote exquisite verse that emphasized mood and imagination. Among his best odes are "To Evening," "To Simplicity," and the one beginning "How sleep the brave." See biographies by P. L. Carver (1967) and H. W. Garrod (1928, repr. 1973), study by O. Doughty (1964).

Collinsville, city (1970 pop. 17,773), Madison co., SW Ill., settled 1817, inc. 1872. It is a former coal-mining center where food products and women's garments are now manufactured. Nearby are the Cahokia Mounds State Park, with its Indian earthworks, and a campus of Southern Illinois Univ.

Collodi, Carlo (kār'lō kōl-lō'dē), pseud. of Carlo Lorenzini (lōrāntē'nē), 1826–90, Italian author. A prolific journalist, he also wrote didactic tales for children, the most famous of which is *Pinocchio*, the story of a Puppet First written (1880) for the *Giornale dei bambini*, the story appeared in book form in 1883 and soon became one of the most widely read juvenile classics. Collodi, however, received little for it. The first English translation (1892) was followed by others in innumerable editions, perhaps the best is that by M. M. Sweet (1927). An animated film version (1940) of *Pinocchio* was made by Walt Disney.

collodion (kālō'dēən), solution of PYROXYLIN in a mixture of alcohol and ether. Upon exposure to air, the solvents evaporate, leaving a thin, colorless, elastic film on any surface upon which the collodion has been spread. Collodion is the forerunner of the lacquer paints that are now widely used in the automobile industry.

colloid (kōl'oid) [Gr. = glue-like], a mixture in which one substance is divided into minute particles (called colloidal particles) and dispersed throughout a second substance. The mixture is also called a colloidal system, colloidal solution, or colloidal dispersion. Familiar colloids include fog, smoke, homogenized milk, and ruby-colored glass. Colloidal particles are larger than molecules but too small to

be observed directly with a microscope, however, their shape and size can be determined by electron microscopy. In a true solution the particles of dissolved substance are of molecular size and are thus smaller than colloidal particles, in a coarse mixture (e.g., a suspension) the particles are much larger than colloidal particles. Although there are no precise boundaries of size between the particles in mixtures, colloids, or solutions, colloidal particles are usually on the order of 10^{-7} to 10^{-3} cm in size. The presence of colloidal particles has little effect on the COLLAGATIVE PROPERTIES of a solution. One way of classifying colloids is to group them according to the phase (solid, liquid, or gas) of the dispersed substance and of the medium of dispersion. A gas may be dispersed in a liquid to form a foam (e.g., shaving lather or beaten egg white) or in a solid to form a solid foam (e.g., styrofoam or marshmallow). A liquid may be dispersed in a gas to form an aerosol (e.g., fog or aerosol spray), in another liquid to form an emulsion (e.g., homogenized milk or mayonnaise), or in a solid to form a gel (e.g., jellies or cheese). A solid may be dispersed in a gas to form a solid aerosol (e.g., dust or smoke in air), in a liquid to form a sol (e.g., ink or muddy water), or in a solid to form a solid sol (e.g., certain alloys). A further distinction is often made in the case of a dispersed solid. In some cases (e.g., a dispersion of sulfur in water) the colloidal particles have the same internal structure as a bulk of the solid. In other cases (e.g., a dispersion of soap in water) the particles are an aggregate of small molecules and do not correspond to any particular solid structure. In still other cases (e.g., a dispersion of a protein in water) the particles are actually very large single molecules. A different distinction, usually made when the dispersing medium is a liquid, is between lyophilic and lyophobic systems. The particles in a lyophilic system have a great affinity for the solvent, and are readily solvated (combined, chemically or physically, with the solvent) and dispersed, even at high concentrations. In a lyophobic system the particles resist solvation and dispersion in the solvent, and the concentration of particles is usually relatively low. The Scottish chemist Thomas Graham discovered (1860) that certain substances (e.g., glue, gelatin, or starch) could be separated from certain other substances (e.g., sugar or salt) by DIALYSIS. He gave the name *colloid* to substances that do not diffuse through a semipermeable membrane (e.g., parchment or cellophane) and the name *crystalloid* to those which do diffuse and which are therefore in true solution. Another property of colloid systems that distinguishes them from true solutions is that colloidal particles scatter light. If a beam of light, such as that from a flashlight, passes through a colloid, the light is reflected (scattered) by the colloidal particles and the path of the light can therefore be observed. When a beam of light passes through a true solution (e.g., salt in water) there is so little scattering of the light that the path of the light cannot be seen and the small amount of scattered light cannot be detected except by very sensitive instruments. The scattering of light by colloids, known as the Tyndall effect, was first explained by the British physicist John Tyndall. When an ultramicroscope (see MICROSCOPE) is used to examine a colloid, the colloidal particles appear as tiny points of light in constant motion, this motion, called BROWNIAN MOVEMENT, helps keep the particles in suspension. ABSORPTION is another characteristic of colloids, since the finely divided colloidal particles have a large surface area exposed. The particles of a colloid selectively absorb ions and acquire an electric charge. All of the particles of a given colloid take on the same charge (either positive or negative) and thus are repelled by one another. If an electric potential is applied to a colloid, the charged colloidal particles move toward the oppositely charged electrode, this migration is called electrophoresis. If the charge on the particles is neutralized, they may precipitate out of the suspension. A colloid may be precipitated by adding another colloid with oppositely charged particles, the particles are attracted to one another, coagulate, and precipitate out. Addition of soluble ions may precipitate a colloid, the ions in sea water precipitate the colloidal silt dispersed in river water, forming a delta. A method developed by F. G. Cottrell reduces air pollution by removing colloidal particles (e.g., smoke, dust, and fly ash) from exhaust gases with electric precipitators. Particles in a lyophobic system are readily coagulated and precipitated, and the system cannot easily be restored to its colloidal state. A lyophilic colloid does not readily precipitate and can usually be restored by the addition of solvent. Thixotropy is a property exhibited by certain gels. A

thixotropic gel appears to be solid and maintains a shape of its own until it is subjected to a shearing (lateral) force or some other disturbance. It then acts as a sol and flows freely. Common thixotropic gels include oil well drilling mud, certain paints and printing inks, and certain clays. Quick clay, which is thixotropic, has caused landslides in parts of Scandinavia and Canada. There are two basic methods of forming a colloid: reduction of larger particles to colloidal size, and condensation of smaller particles (e.g., molecules) into colloidal particles. Some substances (e.g., gelatin or glue) are easily dispersed (in the proper solvent) to form a colloid, this spontaneous dispersion is called peptization. A metal can be dispersed by evaporating it in an electric arc, if the electrodes are immersed in water, colloidal particles of the metal form as the metal vapor cools. A solid (e.g., paint pigment) can be reduced to colloidal particles in a colloid mill, a mechanical device that uses a shearing force to break apart the larger particles. An emulsion is often prepared by homogenization, usually with the addition of an emulsifying agent. The above methods involve breaking down a larger substance into colloidal particles. Condensation of smaller particles to form a colloid usually involves chemical reactions—typically displacement, hydrolysis, or oxidation and reduction.

Collet d'Herbois, Jean Marie (zhāN mārē' kōlō' dērbvā'), 1750–96, French revolutionary, originally an actor and playwright. At first he favored a constitutional monarchy, his *Almanach du Pere Gerard* (1791) was criticized for its royalist tinge, although its patriotism won a competition sponsored by the Jacobins. He then grew more radical, elected to the Convention, he supported Robespierre, persecuted the Girondists, and suppressed the counterrevolutionary attempts at Lyons in a blood bath. Although he turned against Robespierre on 9 Thermidor (July 27, 1794), he fell in the Thermidorian reaction and was deported to French Guiana.

collotype (kōl'atīp) see PRINTING

collusion, conspiracy to defraud a person of his legal rights or to obtain some illegal objective by misusing the forms of law. In suits for divorce, collusion is a conspiracy between the husband and the wife, or one or both of these and a third party, to obtain a DIVORCE on manufactured testimony, usually on pretense of adultery. Such a conspiracy is a bar to divorce.

Collyer, Robert, 1823–1912, American Unitarian clergyman, b. England. By trade a blacksmith, Collyer became a Methodist preacher in 1849. He emigrated to the United States in 1850 and settled near Philadelphia, where for a time he combined his labors as a blacksmith with preaching. In 1859, Collyer became a Unitarian and founded the Unity Church in Chicago, where he served as pastor (1860–79). In 1879 he became minister of the Church of the Messiah, New York City. He was widely known as a lecturer. *Clear Grit* (1913) contains some of his lectures, addresses, and poems. Among his many other works are *The Life That Now Is* (1871) and *Father Taylor* (1906). See biography by J. H. Holmes (1917).

Colman, Norman Jay, 1827–1911, American agriculturist and lawyer, b. near Richfield Springs, N.Y., grad. Univ. of Louisville law school, 1851. He promoted the passage of the Hatch Act (1887), which authorized the creation of agricultural experiment stations. As commissioner of agriculture (1885–89) he was influential in causing the Dept. of Agriculture to be made an executive department (1889). Represented in the cabinet, he was the first Secretary of Agriculture.

Colman, Ronald, 1891–1958, British stage and film actor. Distinguished in demeanor and voice, Colman created an image of kindness, humor, erudition, and romantic appeal. His films include the silent *Stella Dallas* (1927), and the sound films *Raffles* (1931), *Arrowsmith* (1932), *A Tale of Two Cities* (1936), *Lost Horizon* (1937), *The Prisoner of Zenda* (1937), *Random Harvest* (1943), and *Champagne for Caesar* (1949). Colman and his wife, Benita Hume, starred in the television series of the 1950s, *The Halls of Ivy*.

Colmar or **Kolmar** (both kōlmār'), city (1968 pop. 59,550), capital of Haut-Rhin dept., E France, in Alsace, on the Lauch River and the Logelbach Canal. Colmar has textile and other industries. It became a free city of the Holy Roman Empire in 1226, and Louis XIV made it the capital of Alsace in 1673. The old section of Colmar retains its medieval architecture. St. Martin's Church (13th and 15th cent.) contains the *Madonna of the Rose Arbor* by Martin Schongauer, who lived in Colmar all his life. The Unterlinden Museum, in a convent dating from the

13th-14th cent., is outstanding, it contains the Isenheim altarpiece by Mathias Grunewald and numerous masterpieces of the Rhenish school of the 15th cent.

Cologne (kəlōn'), Ger. *Köln*, city (1970 pop. 848,352), North Rhine-Westphalia, W West Germany, on the Rhine River. It is a commercial and industrial center, a rail and road junction, and a river port. Its manufactures include iron, steel, heavy machinery, chemicals, textiles, printed materials, and eau de Cologne. A Roman garrison in the 1st cent. 8 C., Cologne was made a Roman colony in A.D. 50 by Emperor Claudius, who named it *Colonia Claudia Ara Agrippinensis* for his wife, Agrippina. The city passed under Frankish control in the 5th cent. The episcopal see, established there in the 4th cent., was made an archdiocese under Charlemagne. Its archbishops, who later ruled a strip of land on the west bank of the Rhine as princes of the Holy Roman Empire, acquired great power and ranked third among the ELECTORS. The archbishops' constant feuds with the lay citizenry resulted in the transfer (mid-13th cent.) of their residence to nearby Brühl, then to Bonn. Cologne was self-governing after 1288, became a free imperial city in 1475, and, as a member of the Hanseatic League, flourished as a commercial center until the 16th cent. Its decline was hastened by the expulsion of the Jews (15th cent.) and the restrictions imposed on Protestants (16th cent.). Cologne was seized by the French in 1794, and the archbishopric was officially secularized in 1801. The city passed to Prussia in 1815, and in 1821 the archdiocese was reorganized. In the 19th cent. Cologne prospered again as an industrial center and as the main transit port and depot of NW Germany. The industrial town of Deutz (noted for the manufacture of motors), on the east bank of the Rhine, was united with Old Cologne, on the west bank. Old Cologne, with its numerous historic buildings, was severely damaged by aerial bombardment in World War II. The famous Gothic cathedral, the largest in northern Europe, was closed from the end of the war until 1956. It contains the relics of the WISE MEN OF THE EAST and the paintings of Stephen Lochner. The cathedral was begun in 1248 on the site of an older church, but the nave and the two spires (each spire 515 ft/157 m high) were built according to the original plans between 1248 and 1880. Other historic buildings in the city include the Romanesque churches of St. Maria im Kapitol, of St. Gereon, of the Holy Apostles, and of St. Andreas (where Albertus Magnus, the 13th-century scholastic, is buried), the Gothic and Renaissance city hall, and the *Gürzenich* (1441-44), formerly a meeting place of the city's merchants and now a concert hall. Impressive modern structures include the opera house and the radio and television broadcasting stations. As the center of West German Catholicism, Cologne has long been famous for its impressive religious processions and for its exuberant Mardi Gras celebrations. The city figures prominently in German romantic literature. Cologne is the seat of a university (founded 1388, discontinued 1798, reestablished 1919) and numerous museums, including those of painting, ethnology, and municipal history.

Colomb or Colombe, Michel (both mēshēl' kōlōn'), c. 1430-1512, French sculptor, one of the masters of the French Renaissance. Few of his works survive. His name is associated with the execution of the tomb of Francis II, duke of Brittany (completed 1507, Nantes). A relief by Colomb, *St. George and the Dragon* (Louvre), shows a high degree of imagination and skill.

Colomb-Béchar: see BÉCHAR, Algeria.

Colombes (kōlōnb'), city (1968 pop. 80,616), Hauts-de-Seine dept., N central France, on the Seine River. An industrial suburb of Paris, Colombes has fuel refineries, foundries, and publishing houses. A 16th-century church and a sports arena are in the city.

Colombey-les-deux-Églises (kōlōnbē-lā-dōz-äg-lēz'), town (pop. 391), Haute-Marne dept., NE France. The home and grave site of Charles de Gaulle are there.

Colombia (kālūm'bēə, Span. kōlōm'bīya), republic (1973 est. pop. 22,750,000), 439,735 sq mi (1,138,914 sq km), NW South America. The capital is BOGOTÁ. The only South American country with both a Caribbean and a Pacific coastline, Colombia is bounded on the NW by Panama, on the NE by Venezuela, on the S by Ecuador and Peru, and on the SE by Brazil. Colombia has both torrid jungles and majestic, snow-capped mountains. By far the most prominent physical features are the three great Andean chains that fan north from Ecuador. The An-

dean interior is the heart of the country, where in pre-Columbian days the highly advanced CHIBCHA lived. It has the largest concentration of population

and is the area of large-scale cultivation of coffee, Colombia's major crop. Of the three principal Andean ranges, the Western Cordillera is of the least economic importance. One of Colombia's major cities, CALI, lies just east of the range, in the upper Cauca valley. The Central Cordillera has a towering chain of volcanoes (e.g., Tolima) and is the divide between the valleys of the Magdalena and the Cauca rivers. It was until the 19th cent. a backward region, but with improved transportation, the introduction of coffee culture, the exploitation of high-grade coal reserves, and an enormous increase of the white population, its cities of MEDILLIN and MANIZALES have become the economic and industrial core of the republic. A third major city in the Central Cordillera is ARMENIA. The Eastern Cordillera is the longest chain. Its western slopes yield coffee, and in its intermontane basins grains and cattle are raised. The area is rich in iron, coal, and emeralds. Among the leading cities of the highland basins are TUNJA, BUCARAMANGA, and CUCUTA, in addition to Bogotá. To the E of the Andes lies more than half of Colombia's territory, a vast undeveloped lowland. The plains are crossed by navigable rivers, tributaries of the Orinoco and Amazon systems. The northern section consists of savannas (the LLANOS), which are devoted to a large extent to cattle and sheep grazing. VILLAVICENCIO, at the region's western end, is its major urban center. The dense jungles of the extreme southeast are of negligible economic importance. LETICIA is the country's southernmost town, and its only port on the Amazon River. A fourth mountain chain, the Cordillera del Choco, runs parallel to the Pacific N of BUENAVENTURA. The range's slopes yield dyewoods and hardwoods, rubber, tagua nuts (vegetable ivory) and other forest products, and gold and platinum. On the Pacific are the ports of Buenaventura and TUMACO, terminus of a pipeline from the oil-rich area of Putumayo across the mountains. Colombia's chief ocean ports, however, lie on the Caribbean coast to the north: SANTA MARTA, CARTAGENA, and BARRANQUILLA. At Mompón, adjacent to Cartagena, is the terminus of the pipeline from the Barrancabermeja oil fields. In the north, separating the La Guajira peninsula from the rest of the country, is the magnificent Sierra Nevada de Santa Marta, which contains Colombia's highest peak, Pico Cristóbal (18,947 ft/5,775 m). The difficult terrain in Colombia limits the availability of road and rail transportation and makes air and water travel especially important. Agriculture is the chief source of income in Colombia. An extremely wide variety of crops is grown, depending on altitude, but coffee is by far the major crop and its price on the world market has affected Colombia's economic health. Among the commercial crops, coffee is grown between elevations of 3,000 and 6,000 ft (914 and 1,829 m), bananas, cotton, sugarcane, oil palm, and tobacco are grown at lower elevations. Between

6,000 and 10,000 ft (1,829 and 3,048 m) potatoes, beans, grains, and temperate zone fruit and vegetables are grown. Colombia is rich in minerals, including petroleum, iron, coal, gold, silver, platinum, and emeralds. The saltworks at Zipaquirá, near Bogotá, are world famous. The manufacturing sector of the economy has expanded greatly in recent decades, although it is heavily dependent on imported materials. Beverages and processed foods, textiles, metal products, and chemicals are the chief manufactures. Coffee is the main export, others include petroleum and related products, cotton, bananas, and sugar. Various manufactured goods lead the imports. The United States and West Germany are the chief trade partners. In 1969, Colombia joined the Andean Group, an economic organization of South American nations. About two thirds of Colombia's population are mestizos, less than one fifth are of pure European descent. Indians live in the major cities and the remote areas. The small Negro population is concentrated along the coasts and in the Magdalena and Cauca valleys. Spanish is the official language. The population is overwhelmingly Roman Catholic. There are universities in all the major cities. Colombia is governed under an 1886 constitution. The president serves a four-year term. The legislature, subservient to the president, consists of a senate and chamber of deputies. The members are apportioned among the departments (states) and popularly elected for four-year terms. The supreme court is chosen by the president and the legislature. The Conservative and Liberal parties, formed in the 1800s, dominate political life. To insure stability, the two formed the National Front Coalition in 1957 and agreed to divide the major offices between them and alternate in the presidency. The coalition, which ended in late 1973, was challenged in the 1960s by the Popular National Alliance, formed by the former dictator Rojas Pinilla. After the Spanish conquest the area of present-day Colombia formed the nucleus of New Granada (for colonial history, see NEW GRANADA). The struggle for independence was, as in all Spanish-American possessions, precipitated by the Napoleonic invasion of Spain. The revolution was, however, foreshadowed by the rising of the COMUNEROS. Prominent among the first revolutionary leaders was Antonio NARIÑO, who took part in the uprising at Bogotá on July 20, 1810. The revolution was to last nine years before the victory of SIMÓN BOLÍVAR at BOYACÁ (1819) secured the independence of Greater Colombia (Span., *Gran Colombia*). The new state Bolívar created included what is now Venezuela, Panama, and (after 1822) Ecuador, as well as Colombia. Cúcuta was chosen as capital. While Bolívar, who had been named president, headed campaigns in Ecuador and Peru, the vice president, Francisco de Paula SANTANDER, administered the new nation. Political factions soon crystallized. Santander advocated a union of federal sovereign states, while Bolívar championed a centralized republic. Although Bolívar's authority prevailed by and large in the constitutional assembly (1828), Greater Colombia soon fell apart. In 1830, Venezuela and Ecuador became separate nations. The remaining territory emerged as the republic of New Granada. Through the 19th cent. and into the 20th cent. political unrest and civil strife reappeared constantly. Strong parties developed along conservative and liberal lines, the conservatives favored centralism and participation by the church in government and education, and the liberals supported federalism, anti-clericalism, and some measure of social legislation and fiscal reforms. Civil war frequently erupted between the factions. During the 19th and early 20th cent. three statesmen stand out—Tomas Cipriano de MOSQUERA, Rafael NUÑEZ, and Rafael REYES. While Mosquera was president, a treaty was concluded (1846) granting the United States transit rights across the Isthmus of Panama. A new constitution in 1858 created a confederation of nine states called Granadina. Three years later (1861) under Mosquera, the country's name was changed to the United States of New Granada and in 1863 to the United States of Colombia. The antifederalist revolution of 1885 led one year later, during the presidency of Nuñez, to the formation of the republic of Colombia and enactment of a conservative constitution. In 1899, five years after Nuñez's death, civil war of unprecedented violence broke out and raged for three years. As many as 100,000 people were killed before the Conservatives emerged victorious. Another humiliation occurred when, after the United States had acquired the right to complete the Panama Canal (although the agreement was later rejected by the Colombian congress), the republic of Panama declared and, aided by the United

States, achieved its independence from Colombia (1903). During the semidictatorial administration (1904-9) of Reyes, internal order was restored and the country's trade and productivity were vigorously expanded. Reyes, nevertheless, had to resign because of discontent over his handling of the Panama issue. Soon afterward Colombia recognized (1914) Panama's independence in exchange for rights in the Canal Zone and the payment of an indemnity from the United States. For the next four decades political life remained fairly peaceful, although there was economic and social unrest in the 1920s and 1930s. Colombia settled (1917) its boundary disputes with Ecuador, and in 1934 a border clash with Peru over the town of Leticia was settled by the League of Nations in Colombia's favor. Under the leadership of the liberals Olaya Herrera (1930-34), Alfonso Lopez (1934-38), and Eduardo Santos (1938-42), wide-ranging reforms were enacted. Colombia participated in World War II on the Allied side. During the war years, internal divisions worsened. The Liberals split and in the 1946 elections presented two candidates, enabling the Conservatives to win. In 1948, while an Inter-American Conference was being held in Bogotá, the leftist Liberal leader Jorge Eliecer Gaitan, under whom the party had reunited, was assassinated, precipitating violent riots and acts of vandalism. The death of Gaitan exacerbated the enmity between social groups and plunged the country into a decade of civil strife, martial law, and violent rule that cost hundreds of thousands of lives. Political violence turned into sheer criminality (*la violencia*), particularly in rural areas. An archconservative dictator, Laureano Gomez, took power in 1950, when the Liberals put forward no candidate. In 1953, Gomez was ousted by a coup led by Gustavo Rojas Pinilla, the head of the armed forces. Repressive measures continued, fiscal reforms failed, the country was plunged into debt, and Rojas Pinilla became implicated in scandalously corrupt schemes. A military junta, backed by liberals and conservatives alike, ousted Rojas Pinilla in 1957. The following year Alberto Lleras Camargo became president, elected under the National Front coalition agreement. The National Front presidential candidate of 1970, Misael Pastrana Borrero, won very narrowly over Rojas Pinilla, who returned to politics as the champion of the underprivileged. Colombia's economy began to recover from the setbacks of the early 1970s as economic diversification and incentives to lure foreign capital into the country were initiated. However, a high inflation rate continued to impede economic growth. In 1974 the Liberal party candidate Alfonso Lopez Michelsen won the first presidential election following the end of the National Front. See Gerardo Reichel-Dolmatoff, *Colombia* (1965), J. L. Payne, *Patterns of Conflict in Colombia* (1968), Orlando Fals-Borda, *Subversion and Social Change in Colombia* (rev. ed., tr. 1969), A. E. Havens and W. L. Flinn, *Internal Colonialism and Structural Change in Colombia* (1970), T. E. Weil and others, *Area Handbook for Colombia* (1970), W. P. McGreevey, *An Economic History of Colombia, 1845-1930* (1971), J. M. Henao and Gerardo Arruba, *History of Colombia* (tr. 2 vol., 1938, repr. 1972).

Colombo, Emilio (āmē'lyō kōlōm'bō), 1920-, Italian political leader. He was elected a member of the constituent assembly in 1946 and a parliamentary deputy for the Christian Democratic party in 1948. During a lengthy tenure in associate cabinet posts, he helped initiate some of Italy's basic postwar reforms, including land redistribution, nationalization of electrical utilities, and a program of government aid for the development of the impoverished south. He is credited with having written much of the Treaty of Rome, which established the European Economic Community (Common Market) in 1958. After serving as minister of the treasury from 1963 to 1970, he became premier in Aug. 1970. His coalition government fell in Jan. 1972, but he continued to hold successive cabinet posts.

Colombo (kālūm'bō), largest city (1971 pop. 562,442) and capital of Sri Lanka (Ceylon), a port on the Indian Ocean near the mouth of the Kelani River. The original Sinhalese name, *Kālantotta* ("Kelani ferry"), was corrupted to *Kolambu* by Arab traders and was changed to Colombo by the Portuguese. The city's major sections are the old area of narrow streets and colorful market stalls, the modern commercial, business, and government area around the 16th-century Portuguese fort, and Cinnamon Gardens, a wealthy residential and recreational area. Colombo has one of the world's largest man-made harbors and is a popular port of call for passenger

ships. Most of Sri Lanka's foreign trade passes through the port. There are also modern facilities for containerized cargo. Gem cutting and ivory carving are among Colombo's specialties; other industries include food and tobacco processing, metal fabrication, engineering, and the manufacture of chemicals, textiles, glass, cement, leather goods, clothing, furniture, and jewelry. An oil refinery is on the city's outskirts. Colombo was probably known to Greco-Roman, Arab, and Chinese traders more than 2,000 years ago as an open anchorage for oceangoing ships. Muslims settled there in the 8th cent. A.D. The Portuguese arrived in the 16th cent. and built a fort to protect their spice trade. The Dutch, also coveting this trade, gained control in the 17th cent. In 1796, Colombo passed to the British, who made it the capital of their crown colony of Ceylon in 1802. In the 1880s, Colombo replaced Galle as Ceylon's chief port and became a major refueling and supply center for merchant ships on the Europe-Far East route. Colombo served as an Allied naval base in World War II and was made the capital of independent Ceylon in 1948. The Colombo Plan, an international program to aid the economic development of Asian nations, was launched at a conference there in 1950. Two faculties of the Univ. of Sri Lanka, several colleges and research institutes, an observatory, a national museum, Independence Hall (1948), and numerous churches, mosques, and Buddhist and Hindu temples are in Colombo, on the outskirts are two Buddhist universities. About half the city's population is Sinhalese, there are also Tamils, Moors, and small European and Indian communities.

Colombo Plan: see INTERNATIONAL GOVERNMENTAL ORGANIZATIONS

Colón (kōlōn'), city (1970 pop. 25,986), Matanzas prov., W. central Cuba. It is a rail hub and commercial center for the surrounding agricultural region. Colón's sugar industry reached its heyday in the middle 19th cent. and has since declined. The city was founded in 1818.

Colón, city (1970 pop. 67,695), Panama, at the Caribbean end of the Panama Canal. Colón, the second largest city in Panama, is surrounded by, but not part of, the Canal Zone. Cristobal, within the zone, is a suburb. Colón is an important port and commercial center. It was made a free trade zone in 1953. The city was founded in 1850 by Americans working on the trans-Panama railroad and was named Aspinwall until 1890. The city was often scourged by yellow fever until the sanitary work associated with the construction of the canal was completed under W. C. Gorgas.

colon, in anatomy: see INTESTINE

colon, in writing: see PUNCTUATION

Colonia (kōlō'nyā), city (1963 pop. 12,839), capital of Colonia dept., S Uruguay, on the Rio de la Plata. It is a resort city, a port, and the trade center for a rich agricultural region. The city, founded by the Portuguese in 1680, was bitterly contested before being ultimately secured by the Spanish. Colonia has many fine examples of colonial architecture.

Colonial architecture: see AMERICAN ARCHITECTURE
Colonial Conference, British: see IMPERIAL CONFERENCE

Colonial Heights, city (1970 pop. 15,097), in, but not part of, Chesterfield co., SE Va., inc. as a city 1948. Metal awnings and paint are manufactured, tires are retreaded, and whiskey is bottled in the city. Of particular interest is the Violet Bank Library and Museum and the giant cucumber tree in front of it. In 1864, during the Civil War, Gen. Robert E. Lee made his headquarters under the tree while directing the defense of besieged Petersburg (across the Appomattox River from Colonial Heights).

Colonial National Historical Park, 9,430 acres (3,816 hectares), SE Va., mainly on the peninsula between the York and James rivers, created 1930 as Colonial National Monument, renamed 1936. The park embraces a historic region that includes YORKTOWN, JAMESTOWN, WILLIAMSBURG, and Cape Henry (added 1939, see HENRY CAPE), the Colonial Parkway, part of the park, links the three old towns. Archaeological and historical studies as well as reconstruction of old places of interest have been carried on.

colonial preference: see TARIFF

colonization, extension of political and economic control over an area by a state whose nationals have occupied the area and usually possess organizational or technological superiority over the native population. It may consist simply in a migration of nationals to the territory, or it may be the formal assumption of control over the territory by military

or civil representatives of the dominant power (see COLONY). Overpopulation, economic distress, social unrest, and religious persecution in the home country may be factors that cause colonization, but IMPERIALISM, more or less aggressive humanitarianism, and a desire for adventure or individual improvement are also causes. Colonization may be state policy, or it may be a private project sponsored by chartered corporations or by associations and individuals. Before colonization can be effected, the indigenous population must be subdued and assimilated or converted to the culture of the colonists; otherwise, a *modus vivendi* must be established by the imposition of a treaty or an alliance. As early as the 10th cent. B.C., the Phoenicians founded trading posts throughout the Mediterranean area and later exercised political dominion over these commercial colonies. The Greeks, from a desire for wealth or as a result of the expulsion of a political faction or the defeated inhabitants of a city, established colonies in Asia Minor and Italy, spreading Hellenic culture and stimulating trade. Greek colonies were patterned after the parent state and were at first subject to its jurisdiction. Colonization was an integral part of Roman policy, providing land for the poor, supporting Roman garrisons, and again spreading Roman culture. In their colonization the Romans sought to assimilate the native culture into their own, and in some cases they bestowed Roman citizenship upon natives of the colony. Medieval colonization began with the Crusades and was mainly Italian. The Venetians and Genoese established commercial colonies along trade routes and exercised strict supervision over them. The Portuguese and Spanish became great colonizing nations at the end of the Middle Ages. Portuguese colonization, which received impetus from the development of greatly improved methods of navigation, began with the establishment of trading ports in Africa and the East, while the Spanish concentrated most of their efforts in the Americas. Both the Spanish and the Portuguese exercised strict governmental control over their colonies and used them primarily as a basis for rich commerce with the parent government. They discouraged them from becoming economically self-sufficient. In the late 16th and early 17th cent., the English, Dutch, and French began to undertake colonization through the agency of CHARTERED COMPANIES. The greatest of these private trading companies was the British EAST INDIA COMPANY, which played a vital role in the history of the BRITISH EMPIRE. The French generally adhered to mercantilist theory in establishing their colonies, using them mainly for the economic advantage of France. The English colonists in North America, however, were, in many respects, virtually independent of the parent country, the most serious restriction being the establishment of a trade monopoly by the home government through the NAVIGATION ACTS. Because their territory was suitable for settlement, rather than exploitation, the residence of the British colonists in America tended to be permanent. The increase in overseas trade and colonial consumption helped to stimulate the INDUSTRIAL REVOLUTION, which in turn, because of the increased technological superiority afforded Europe, especially Great Britain, and because of the greater desire for markets and raw materials, gave added impetus to colonization and made it easier to accomplish. Although Great Britain lost most of its North American colonies as a result of the American Revolution, other acquisitions (most notably in India) soon made it the greatest colonial power in the world. The French, stripped of one colonial empire in the colonial wars of the 18th cent., established another in the 19th cent. Germany emerged as an industrial empire in the late 19th cent., but found the colonies of other powers closed to German products and, therefore, embarked upon its own colonial adventures. Japan, also recently industrialized, followed the same path. These ambitions helped to bring on World Wars I and II. Germany was stripped of its colonies after the first conflict, Japan lost its colonies after the second. Modern colonization, frequently preceded by an era in which missionaries and traders were active, has been largely exploitative. Moreover, it has not in the long run proved directly lucrative to the colonial power, because it has involved a heavy drain on the treasury of the home government. Colonization in its classical form is rarely practiced today and is widely considered to be immoral. Most former colonies, especially those in Africa and Asia, have achieved independence from the imperial powers. See MANDATES, TRUSTEESHIP TERRITORY. See D. K. Fieldhouse, *The Colonial*

Empire (1965), C. Verlinden, *The Beginnings of Modern Colonization* (1970), J. H. Parry, *Trade and Dominion* (1971)

Colonna (kölôn'na), noble Roman family that played a leading part in the history of Rome from the 12th to the 16th cent. They were hereditary enemies of the ORSINI family and generally sided with the Ghibellines, or antipapal faction, against the popes. **Sciarra Colonna**, d. 1329, a bitter enemy of Pope BONIFACE VIII, was excommunicated, fled to the court of King Philip IV of France, and led, with Chancellor Nogaret, the French expedition that captured (1303) Boniface. As senator of Rome, Sciarra supported Holy Roman Emperor LOUIS IV during his Italian expedition and bestowed the imperial crown on him in 1328, but he was forced into exile when Louis departed shortly afterwards. Despite its antipapal attitude, the family produced in Pope MARTIN V (Oddone Colonna) one of the most successful advocates of papal authority. **Fabrizio Colonna**, d. 1520, was a general of the HOLY LEAGUE against King Louis XII of France. His daughter was Vittoria Colonna (see separate article). **Prospero Colonna**, 1452-1523, Fabrizio's cousin, also fought the French in the Italian Wars and defeated them (1522) at La Bicocca. **Marcantonio Colonna**, 1535-84, duke of Paliano, commanded the papal forces in the battle of Lepanto (1571) against the Turks. Many other members of the family distinguished themselves in the service of the Holy See and of Spain. Three lines of the family, all of princely rank, are still in existence. The Colonna Palace in Rome was begun by Martin V.

Colonna, Vittoria, marchesa di Pescara (vêtô'rêa kôlôn'na markâ'za dê pâska'ra), 1492-1547, Italian poet, daughter of Fabrizio Colonna. Her love for her husband, Ferrante d'Avalos, is the subject of part of her lamenting verse. After his death (1525) she lived in convents, devoting herself to religious reform. The larger part of her work treats religious themes. In her later years she was a close friend of Michelangelo. For a translation of her verse, see Lorna de' Lucchi, *An Anthology of Italian Poems* (1922).

colonnade (kôlônâd'), a row of columns usually supporting a roof. There are generally two rows of columns or one row and a wall. Colonnades were

Colonnade

popular with the Greeks and Romans, who employed them in the STOA and the PORTICO, they have continued to be used throughout the Middle Ages, the Renaissance, and modern times. See COLUMN.

Colonne, Édouard (âdôâr' kôlôn'), 1838-1910, French conductor and violinist. He appeared as a conductor in Europe and England and was for several years first violinist of the Paris Opera. In 1873 he founded in Paris the Concert national, which later became known as the Colonne Concerts.

Colonsay (kôl'ânzâ), island, 17 sq mi (44 sq km), Argyll, NW Scotland, one of the Inner Hebrides. Crofting and cheese making are the main occupations. Colonsay is separated from Oronsay by a narrow sound.

colony, any nonself-governing territory subject to the jurisdiction of a usually distant country. The term is also applied to a group of nationals who settle in a foreign country or territory but retain political or cultural connections with their parent state. Colonies in the first sense are traditionally classified as either colonies of settlement or colonies of exploitation. A colony of settlement is usually founded in an uninhabited or sparsely inhabited region and one that is climatically congenial to the settlers. There the colonists often recreate the features of the home government, modifying them to suit new conditions. Colonies of exploitation are established for the purpose of exploiting a region rich in resources or with commercial possibilities. Such colonies often have dense native populations. Colonists in a colony of exploitation will consist chiefly of military and administrative officers and commercial and financial representatives. The use of slaves

and forced labor has often been a feature of such colonies. In a colony of exploitation, the government tends to be highly centralized and is frequently upheld by the presence of a strong police force or army, in a colony of settlement, there is generally rapid evolution from a purely military or autocratic government to autonomy or incorporation within the parent state. Since the 18th cent., colonial problems and their settlement have played a central role in European diplomacy and international relations. Strategic considerations, diplomatic rivalries, and the search for markets all led to a dramatic growth in European colonial holdings in the 19th cent. (See COLONIZATION and IMPERIALISM). In the late 19th cent., Great Britain began granting autonomy to some of its colonies, ultimately resulting in the transformation of the BRITISH EMPIRE into the COMMONWEALTH OF NATIONS. In the 20th cent., many colonial areas came under international supervision through the MANDATES system, or its successor, the trusteeship system (see TRUSTEESHIP, TERRITORIAL). The nature of the French empire was changed profoundly with the creation (1946) of the FRENCH UNION and its reorganization (1958) as the FRENCH COMMUNITY. By the early 1970s most of the former colonies of the Western European powers had become independent nations. Of those that had not, most were autonomous in internal affairs and many remained colonies by choice. The most notable exceptions were the Portuguese colonies, which, despite nationalist uprisings, remained under direct Portuguese rule. However, in 1974, following the overthrow of the Caetano regime, Portugal began to divest itself of its colonies. For bibliography, see under COLONIZATION and IMPERIALISM.

colophon (kôl'âfôn') [Gr., =finishing stroke]. Before the use of printing in Western Europe a manuscript often ended with a statement about the author, the scribe, or the illuminator. The first printed book to have a comparable concluding statement was the Mainz Psalter, crediting the printer and giving the date printed (1457) in its last paragraph. After this, a printed book commonly ended with a statement of the kind, now called a colophon. The information came to be given on the title page after c. 1520. The name colophon is applied also to a printer's mark or a publisher's device on a title page or elsewhere.

color, effect produced on the eye and its associated nerves by light waves of different wavelength or frequency. Light transmitted from an object to the eye stimulates the different color cones of the retina, thus making possible perception of various colors in the object. When white light passes through a glass PRISM, it is separated into a band of colors called a SPECTRUM. Since the colors that compose sunlight or white light have different wavelengths, the speed at which they travel through the glass differs. The colors of the visible spectrum, called the elementary colors, are red, orange, yellow, green, blue, indigo, and violet, red light, having the longest wavelength, travels more rapidly through the glass than blue light, which has a shorter wavelength. Color is therefore a property of light that depends on wavelength. When light falls on an object, some of it is absorbed and some is reflected. The apparent color of an object depends on the wavelength of the light that it reflects, e.g., a red object observed in daylight appears red because it reflects only the waves producing red light. The color of a transparent object is determined by the wavelength of the light transmitted by it. An opaque object that reflects all wavelengths appears white, one that absorbs all wavelengths appears black. Black and white are not generally considered true colors, black is said to result from the absence of color, and white from the presence of all colors mixed together. Colors whose beams of light in various combinations can produce any of the color sensations are called primary, or spectral, colors. The process of combining these colors is said to be "additive", i.e., the sensations produced by different wavelengths of light are added together. The additive primaries are red, green, and blue-violet. White can be produced by combining all three primary colors. Any two colors whose light together produces white are called complementary colors, e.g., yellow and blue-violet, or red and blue-green. When pigments are mixed, however, the resulting sensations differ from those of the transmitted primary colors, the process in this case being a "subtractive" one, since the pigments subtract or absorb some of the wavelengths of light. Magenta (red-violet), yellow, and cyan (blue-green) are called subtractive primaries, or primary pigments. A mixture of blue and yellow pigments yields green, the only color not absorbed by one pigment or the

other. A mixture of the three primary pigments produces black. The scientific description of color, or colorimetry, involves the specification of all relevant properties of a color either subjectively or objectively. The subjective description gives the hue, saturation, and lightness or brightness of a color. Hue refers to what is commonly called color, i.e., red, green, blue-green, orange, etc. Saturation refers to the richness of a hue as compared to a gray of the same brightness, in some color notation systems, saturation is also known as chroma. The brightness of a light source or the lightness of an opaque object is measured on a scale ranging from dim to bright for a source or from black to white for an opaque object (or from black to colorless for a transparent object). In some systems, brightness is called value. A subjective color notation system provides comparison samples of colors rated according to these three properties. In an objective system for color description, the corresponding properties are dominant wavelength, purity, and luminance. Much of the research in objective color description has been carried out in cooperation with the Commission Internationale de l'Eclairage (CIE), which has set standards for such measurements. In addition to the description of color according to these physical and psychological standards, a number of color-related physiological and psychological phenomena have been studied. These include color constancy under varying viewing conditions, color contrast, afterimages, and advancing and retreating colors. Color has long been used to represent affiliations and loyalties and as a symbol of various moods and qualities. A well-known use of the symbolism of color is in the liturgical colors of the Western Church, according to which the color of the vestments varies through the ecclesiastical calendar, e.g., purple (i.e., violet) is the color of Advent and Lent, white, of Easter, and red, of the feasts of the martyrs. See also LIGHT, PAINTING, PROTECTIVE COLORATION, VISION. See R. M. Evans, *An Introduction to Color* (1948), Faber Birren, *Creative Color* (1961), Gunter Wyszecki and W. S. Stiles, *Color Science* (1967).

Colorado (kôlôrâd'ô, -râd'ô, -râd'ô), state (1970 pop. 2,207,259) 104,247 sq mi (270,000 sq km), W central United States, one of the Rocky Mt. states, admitted as the 38th state of the Union in 1876 (and therefore known as the "Centennial State"). DENVER is the capital, by far the largest city, and the center of state activity. Other major cities are COLORADO SPRINGS, PUEBLO, LAKEWOOD, AURORA, and BOULDER. Colorado is bounded on the N by Wyoming and Nebraska, on the E by Nebraska and Kansas, on the S by Oklahoma and New Mexico, and on the W by Utah. The plains of Colorado's eastern section are part of the High Plains section of the Great Plains. On their western edge the plains give way to the foothills of the Rocky Mts., which run north-south through central Colorado. The mountains are divided into several ranges that make up two generally parallel belts, with the Front Range and a portion of the Sangre de Cristo Mts. on the east and the Park Range, Sawatch Mts., and San Juan Mts. on the west. Mt. Elbert (14,433 ft/4,399 m) is the highest peak in the U.S. Rocky Mts. The mountain ranges are separated by high valleys and basins called parks. These include North Park, Middle Park, South Park, and San Luis Park. The Continental Divide runs north-south along the Rocky Mts. in Colorado. One of the most scenic states in the country, Colorado's parks include Rocky Mountain National Park, Black Canyon of the Gunnison National Monument with its narrow gorge cut by the Gunnison River, Dinosaur National Monument in NW Colorado, and Great Sand Dunes National Monument in S central Colorado. Mesa Verde National Park, once the home of Indian CLIFF DWELLERS, is located in the southwestern corner of the state, a beautiful but formidable area of mesas and canyons. Most of W Colorado is occupied by the Colorado Plateau, where many canyons have been formed by the action of the Colorado, Gunnison, and other rivers. Colorado has a mean elevation of c. 6,800 ft (2,070 m) and has 51 of the 80 peaks in North America over 14,000 ft (4,267 m) high, thus laying claim to the name "top of the world." Melting snows from the mountains form important river systems that nourish the water-hungry lands of the Southwest. A broad timber belt, largely coniferous and mostly protected as national forest reserves, acts as a huge reservoir. The mighty Colorado River originates in Rocky Mountain National Park, and the headwaters of the North Platte, South Platte, Arkansas, and Rio Grande also gather in Colorado's mountains. The average annual rain-

fall in Colorado is only 166 in (42.2 cm), but by means of irrigation the state has been able to develop otherwise unusable land and ranks high among the states in irrigated acres. The COLORADO-BIG THOMPSON PROJECT and the Fryingpan-Arkansas project are two major water-diversion systems that carry water by tunnel across the Continental Divide to farms on the plains of E Colorado. Agriculture, especially the raising of cattle and sheep, is economically important in the state. Crops, which include wheat, hay, corn, and sugar beets, accounted for less than a quarter of all farm income in 1970. In the 1950s manufacturing displaced agriculture as the major source of income in the state. Food processing is the main industry. Other important industries include the manufacture of nonelectrical equipment, transportation equipment, and electrical equipment, printing and publishing, and the production of stone, clay, and glass products, fabricated metals, chemicals, and lumber. Tourism also plays a vital role in the economy. Colorado's climate, colorful scenery, and extensive recreational facilities attract millions of visitors to the state annually. Besides fine hunting and fishing and skiing there are many special events held in the state, including rodeos and fairs. Gold, the lure to exploration and settlement of Colorado, was the first of many useful minerals to be discovered there. In 1970 molybdenum was the most valuable mineral produced in the state. Colorado has the world's largest known deposit of that mineral. Other leading minerals are petroleum, coal, sand and gravel, and uranium. Gold is no longer mined extensively. Large coal and oil deposits provide considerable resources for the generation of electricity. Hydroelectric power is also used, although on a smaller scale. Colorado's earliest inhabitants were the BASKET MAKERS, Indians who settled in the mesa country before the beginning of the Christian era. Later Indians known as cliff dwellers inhabited the area, building their pueblos in canyon walls. The first white man to enter the region was probably the Spanish conquistador Francisco Vazquez de Coronado in the 16th cent. Spain subsequently claimed (1706) the territory, although no Spanish settlements were established there. The search for gold lured Juan María Rivera into the San Juan valley in 1765, and in 1776 the Franciscan friars Silvestre Velez de Escalante and Francisco Atanasio Dominguez journeyed through part of what is now Colorado. Part of the area was also claimed for France as part of the Louisiana Territory. At the end of the French and Indian Wars (1763), France secretly ceded the Louisiana Territory, including much of Colorado, to Spain. The French regained the whole area in 1800 by the secret Treaty of San Ildefonso concluded with Spain (see SAN ILDEFONSO, TREATY OF). There were still few white men when the United States bought the area N of the Arkansas River and E of the Rocky Mts in the Louisiana Purchase of 1803. The Federal government sent expeditions to Colorado under Zebulon M. Pike (1806), Stephen H. Long (1819-20), and John C. Fremont (1842-43 and 1845). These expeditions generated some public interest in the new territory, and they explored routes opened earlier by the famous MOUNTAIN MEN, trappers, and fur traders who included William H. Ashley, James Bridger, Jedediah S. Smith, Kit Carson, and the Bent brothers. Bent's Fort, in Colorado, was one of the best-known Western trading posts. Settlement in the area did not begin, however, until the United States acquired the remainder of present-day Colorado from Mexico by the Treaty of Guadalupe Hidalgo in 1848. In the early 1800s a small farming settlement had been established in the San Luis valley, but most settlers pushing westward across the Great Plains continued on to the more fertile lands of Oregon, Washington, and California. It was the discovery of gold that first brought large numbers of white men to Colorado. Prospectors led by Green Russell discovered gold in 1858 at Cherry Creek, where the city of Denver now stands. The next year John Gregory made a great strike on the site of present-day Central City, and the lusty, lawless days of the mining boom began. At the time of the gold rush the area in which the gold fields were located was part of the U.S. Kansas Territory. A group of miners organized the gold fields as Arapahoe co. of Kansas Territory. The region was divided into districts, and miners' and people's courts were set up to provide quick justice. The miners sought separate territorial status in 1859 and formed the illegal Territory of Jefferson, which operated until the bill for territorial status was passed by Congress in 1861. William Gilpin, the first territorial governor, chose the name Colorado [Span., =red or colored]. Measures proposing statehood for Colo-

rado were introduced in the U.S. Congress in 1864, and again in 1866 and 1867 when they were vetoed by Andrew Johnson. A bill granting Colorado's state-

hood was finally passed by Congress in 1876. It was also in the 1860s and 1870s that Colorado's settlers achieved peace with the Indians of the area. When the first white settlers came to Colorado, Ute Indians lived in the mountain areas, while Comanche, Cheyenne, Arapaho, and Kiowa Indians roamed the Great Plains. Intertribal warfare between plains and mountain Indians was continuous. The tribes of the plains combined their forces in 1840 to halt the invasion of their homelands and hunting grounds by white settlers, and Indian massacres and lootings were accompanied by the subsequent reprisals carried out by white men. The Federal government tried and failed to achieve peace with the Indians. The warfare finally culminated in the defeat of the Indians after the Indian Wars (1861-69) and the Buffalo War (1873-74). The Ute Indians of the mountains also raided white settlements until a Ute chief, Ouray, brought peace to the tribe in 1873 (there was a brief outbreak of hostilities in 1879) through the cession of Ute territory to the United States. Today, Colorado's Indians live mainly on the Southern Ute reservation and in the Denver area. While Colorado was seeking to establish a government and to deal with the Indian problem, the state's mining boom was in sharp decline. The surface gold had been extracted in the middle 1860s, and mining areas became, and in many cases remain, studded with ghost towns—the machinery abandoned and shacks deserted. Other towns, such as Central City with its famous opera house dating from the city's days of opulence, managed to stay alive. The completion (1870) of a railroad link from Denver to the Union Pacific in Cheyenne, Wyo., and later railroad construction helped to stimulate the extension of farming and the growth of huge cattle ranches as well as to encourage an influx of settlers. In 1870, Nathan C. Meeker, former agricultural editor for the *New York Tribune*, established an agricultural community, Union Colony, at Greeley (named for Horace Greeley). The community constructed Colorado's first large irrigation canal. Between 1870 and 1880 population increased almost five-fold. Denver briefly became the largest receiving market for sheep, and a smelting industry was established. In the 1870s the discovery of silver-bearing lead carbonate ore at Leadville started a new mining boom. Prosperity was short-lived, however, for in the 1890s, despite a rich silver strike at Creede and the discovery of the state's richest gold field at Cripple Creek, Colorado suffered a depression. In 1893 the U.S. government stopped buying silver in order to restore confidence in the nation's currency, which had been placed on the gold standard in 1873. The silver market subsequently collapsed, dealing a severe blow to Colorado's economy. Labor conflicts, disputes over railway franchises, and warfare between sheep and cattle interests also plagued the state at the turn of the century. Many of labor's battles in this period were fought in the mines of Colorado, and the lawlessness and ruthlessness that prevailed among both employers and miners were reminiscent of the early days of the mining camps. When the silver market broke, Colorado turned politically to fusion. Populist-Democratic leaders advocating a return to bimetallism. The free-silver movement, however, was unsuccessful, and by 1910, with the improvement of national economic conditions, Colorado settled down to a predominantly agricultural economy. The establishment of large national parks in the early 1900s provided an additional source of revenue in tourism. During World War I the price of silver soared again and the economy prospered. The stock-market crash of 1929 and the droughts of 1935

and 1937 brought hardship to many. The economy recovered again during World War II, when the state produced food and valuable minerals and metal products for the war effort. Since the mid-1960s Colorado has experienced a large influx of new residents and rapid urban growth and development, especially along a strip (c. 150 mi/240 km long) centered on Denver and stretching from Fort Collins and Greeley in the north to Pueblo in the south. Colorado's state government is based on the constitution drawn up in 1876 and since amended. The governor of the state is popularly elected and serves for a term of four years. The legislature is made up of a senate with 35 members elected for four-year terms and a house of representatives with 65 members elected for two-year terms. Colorado is represented in the U.S. Congress by two Senators and five Representatives and has seven votes in the electoral college. Since the decline of populism in the state in the early part of the 20th cent., neither the Republican nor Democratic party has consistently dominated Colorado state politics. In 1974, Richard D. Lamm, a Democrat, was elected governor. Among Colorado's institutions of higher learning are the Univ. of Colorado, at Boulder, the Univ. of Denver, at Denver, Colorado State Univ., at Fort Collins, and the United States Air Force Academy, at Colorado Springs. See Robert Emmitt, *The Last War Trail* (1954), Perry Eberhart, *Guide to the Colorado Ghost Towns and Mining Camps* (1959), Caroline Bancroft, *Colorful Colorado: Its Dramatic History* (1959), Federal Writers' Project, *Colorado: A Guide to the Highest State* (1941, repr. 1970), P. F. Dorset, *The New Eldorado: The Story of Colorado's Gold and Silver Rushes* (1970), Le Roy R. Hafen, *Colorado: The Story of a Western Commonwealth* (1970), C. W. Casewit, *Colorado* (1973).

Colorado (kōlōrā'thō), river, c.550 mi (885 km) long, rising from tributaries in the Andes and flowing SE across S central Argentina to the Atlantic Ocean. It marks the northern limit of Patagonia. It is also a rough boundary between the commercial agriculture to the north and ranching to the south. The Colorado is unnavigable and frequently overflows its banks in the spring.

Colorado (1 kōlārād ə, -rād ō, -rādō 2 kōlārādə, -rādā) Great river of SW United States, 1,450 mi (2,334 km) long, rising in the Rocky Mts of N Colo., and flowing generally SW through Colo., Utah, Ariz., between Nev. and Ariz., and Ariz. and Calif., and then into Mexico, emptying into the Gulf of California, drains c.244,000 sq mi (631,960 sq km). The Gunnison, Green, San Juan, and Little Colorado are the main tributaries of the upper basin of the Colorado, the Gila is the chief tributary of the lower basin. Silt deposited by the Colorado has formed a great delta across the northern part of the Gulf of California, cutting off the head of the gulf, Salton Sea is a remnant of the severed part. The mouth of the river was seen by Francisco de Ulloa in 1539, the lower part was explored by Hernando de Alarcón in 1540. The river flows through c.1,000 mi (1,610 km) of canyons, of which the most spectacular is the Grand Canyon. Many national parks, monuments, and recreational areas are located along the river banks. The Colorado's waters are used for power and irrigation, especially by means of the Colorado River storage project, the Colorado-Big Thompson project, Hoover Dam, Davis Dam, Imperial Dam, the All-American Canal, Parker Dam, and Glen Canyon Dam. Controversies over water rights on the Colorado have long raged between the United States and Mexico and among the bordering states, treaties and compacts now regulate the river's use. 2 River, 894 mi (1,439 km) long, rising in the Llano Estacado, NW Texas, and flowing SE to Matagorda Bay, an inlet of the Gulf of Mexico, drains c.41,500 sq mi (107,485 sq km). Destructive floods, which prevented private development of the river for power, led the Texas legislature to set up the Lower, Central, and Upper Colorado River authorities to undertake projects for flood control, power plants, and irrigation. The Lower Colorado River Authority, with Federal assistance, has been especially active, building five major dams (Buchanan, Roy Inks, Alvin J. Wirtz, Marble Falls, and Mansfield). These projects have benefited a large part of Texas, including the city of Austin. The scenic section of the river above Austin, which includes the lakes formed by the dams, is called Highland Lakes Country. The Central Colorado River Authority has constructed many small irrigation dams and also has jurisdiction over several city reservoirs. The Upper Colorado River Authority regulates the upper Colorado and the several branches of the Concho, a principal tributary.

Colorado, University of, mainly at Boulder, state supported, coeducational, chartered 1861, opened 1877. It has a branch at Colorado Springs and a large general and psychopathic medical center in Denver, it also operates the High Altitude Observatory at Climax. The university museum has a noted collection of materials and specimens relating to the natural history of the Southwest and the Rocky Mountain regions.

Colorado-Big Thompson project, constructed by the U.S. Bureau of Reclamation to divert water from the headstreams of the Colorado River to irrigate c. 720,000 acres (291,400 hectares) of land in NE Colorado and to supply power, built 1938-56. Water is diverted by several dams, notably Granby Dam on the Colorado and Green Mt. Dam on the Blue River. Water is stored in Granby Reservoir, Shadow Mt. Lake, and Grand Lake before it is pumped through the Alva B. Adams Tunnel (13 mi/21 km long), to fall down the eastern slope of the Continental Divide into the Big Thompson River, a tributary of the South Platte. Dams near Fort Collins and Estes Park divert the water for use. Flatiron (71,500-kw capacity), Estes (45,000 kw), Pole Hill (33,250 kw), and Green Mt. (21,600 kw) dams generate power.

Colorado College, at Colorado Springs, Colo., coeducational, chartered and opened 1874.

Colorado National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Colorado Plateau, physiographic region of North America, c. 150,000 sq mi (388,500 sq km), SW United States, in Arizona, Utah, Colorado, and New Mexico. It is characterized by broad plateaus, ancient volcanic mountains at altitudes of c. 5,000 to 13,000 ft (1,520-3,960 m), and deeply dissected great canyons carved into nearly horizontal and often brightly colored sedimentary and volcanic rocks, the GRAND CANYON of the Colorado River is part of the region. Indian reservations occupy about one third of the mostly semiarid and sparsely vegetated area, about one half of the public land is used for grazing. Ancient cliff dwellings at Mesa Verde and Canyon de Chelly are of archaeological interest. The region has a number of U.S. national parks and monuments.

Colorado potato beetle: see POTATO BEETLE.

Colorado River storage project, a multipurpose plan, undertaken by the U.S. Bureau of Reclamation in 1956, to control the flow of the upper Colorado and its tributaries and to aid in the development of the rugged, remote upper Colorado River basin, includes parts of Wyo., Utah, Colo., Ariz., and N. Mex. The Colorado River Compact of 1922 established the division between the upper and lower basins and stipulated that the upper basin's water consumption be contingent on the delivery of a set amount of water to the lower basin. Since the flow of the Colorado is erratic, a storage project was needed to maintain an even flow of water to the lower basin in dry years. A series of dams regulates stream flow, provides storage reservoirs, creates hydroelectric power, and irrigates both new and previously developed acreage. The four major units of the project are GLEN CANYON DAM, on the Colorado River in Arizona, FLAMING GORGE DAM, on the Green River in Utah, NAVAJO DAM, on the San Juan River in New Mexico, and the Curecanti dams on the Gunnison River in Colorado. The three reservoirs of the Curecanti unit are included in the Curecanti National Recreation Area (see NATIONAL PARKS AND MONUMENTS, table). There are 11 authorized participating projects, including the CENTRAL UTAH PROJECT.

Colorado School of Mines, at Golden, state supported, coeducational, chartered 1874. It was one of the first mineral engineering schools in the United States. It owns extensive experimental and research facilities, field laboratories, and an experimental mine at Idaho Springs. See J. R. Morgan, *A World School: The Colorado School of Mines* (1955).

Colorado Springs, city (1970 pop. 135,060), seat of El Paso co., central Colo., on Monument and Fountain creeks, at the foot of Pikes Peak, inc. 1886. It is a beautiful residential and year-round vacation and health resort city, with thriving industries producing a wide variety of products. The town of El Dorado (later Colorado City) was founded on Fountain Creek by gold miners in 1859. In 1871, Gen. William Palmer and the Denver and Rio Grande RR established the modern city of Fountain Colony nearby, the name was changed to Colorado Springs because of the many mineral springs in the area. The city grew as a summer and health resort, absorbing the earlier community of Colorado City in 1917. Today it is the seat of Colorado College and the headquarters

of Pike National Forest. The United States Air Force Academy is nearby, and to the south are U.S. Fort Carson (est. 1942) and Ent Air Force Base, headquarters of the North American air defense command.

Colorado State University, at Fort Collins, land-grant with state and federal support, chartered 1870, opened 1879 as an agricultural college, assumed present name in 1957. The Rocky Mt. Forest and Range Experiment Station and the headquarters of the Colorado State Forest Service are there.

coloration, protective: see PROTECTIVE COLORATION.

coloratura: see SOPRANO.

color blindness, visual defect resulting in the inability to distinguish colors. About 8% of men and 0.5% of women experience some difficulty in color perception. Color blindness is usually an inherited sex-linked characteristic, transmitted through, but recessive in, females. Acquired color blindness results from certain degenerative diseases of the eyes. Most of those with defective color vision are only partially color-blind to red and green, i.e., they have a limited ability to distinguish reddish and greenish shades. Those who are completely color-blind to red and green see both colors as a shade of yellow. Completely color-blind individuals can recognize only black, white, and shades of gray. Color blindness is usually not related to visual acuity, it is significant, therefore, only when persons who suffer from it seek employment in occupations where color recognition is important, such as airline pilots, railroad engineers, and others who must recognize red and green traffic signals. Tests for color blindness include identifying partially concealed figures or patterns from a mass of colored dots and matching skeins of wool or enameled chips of various colors.

color field painting: see POST-PAINTERLY ABSTRACTION.

color index, in astronomy, difference between a star's apparent photographic MAGNITUDE (B) and apparent visual magnitude (V), as measured with standardized photographic plates. Color index is defined as zero for a white star (SPECTRAL CLASS A0). The color index is positive for stars redder than a white star and negative for stars bluer than a white star. In effect, measuring the color index is equivalent to measuring the difference between the amount of blue light and red light that the star radiates.

Colossae (kālōs'ē), ancient city of SW Phrygia, Asia Minor, S of the Maeander (modern Menderes) River, in W Turkey, 4 mi (6.4 km) E of Denizli. It flourished as a trading town until eclipsed by neighboring Laodicea. The area around Colossae was famous for fantastic theological theories in early Christian times. Although Paul himself never went there, he addressed his epistle to the COLOSSIANS through his fellow worker, Epaphras, who lived at Colossae.

Colosseum or **Coliseum** (both kōlāsē'əm), Ital. Colosseo, common name of the Flavian Amphitheater in Rome, near the southeast end of the Forum, between the Palatine and Esquiline hills. Begun by Vespasian, A.D. c. 75, and completed by his son Titus in A.D. 80, it is the most imposing of Roman antiquities. The vast four-storied oval is 617 ft (188 m) by 512 ft (156 m), much of which is still standing, it had tier on tier of marble seats accommodating c. 45,000 spectators. It encloses an arena measuring 250 ft (76 m) by 151 ft (46 m) where gladiatorial combats were held (see GLADIATORS) until 404. According to tradition, persecuted Christians were thrown there to beasts. The Colosseum has been damaged several times by earthquakes. See John Pearson, *Arena: The Story of the Colosseum* (1974).

Colossians (kālōsh'ānz), epistle of the New Testament, the 12th book in the usual order. It was written to the Christians of Colossae and Laodicea (12, 416) by St. PAUL when he was a prisoner, probably in Rome (A.D. c. 60). The writing was provoked, apparently, by the appearance in the churches addressed of some sort of gnostic doctrine involving angels (2:18). Colossians is like EPHESIANS in tone, especially in the emphasis on the doctrine of the mystical body of Christ (1:15-20, 1:24-25, 2:9-10). This book contains several well-known passages, on the apostleship of St. Paul (1:24-29), on baptism (2:12-15), and on death and resurrection "with Christ" (2:20-3:4).

colossus (kālōs'ās), name given, in antiquity, to a statue of very great size. In Egypt were many colossuses, 50 to 60 ft (15.2 to 18.3 m) high. The Athena Parthenos on the Acropolis at Athens and the Zeus in the temple at Olympia in Greece were other examples. The Colossus of Rhodes, one of the seven

wonders of the ancient world, was a large bronze statue, destroyed in antiquity, of the sun god, Helios, in the harbor of Rhodes. It was built at least in part by Chares of Lindus (Rhodes) between 292 and 280 B.C. Its height probably was something over 100 ft (30.5 m). The bronze had been taken from the machines and tools left behind by DEMETRIUS I after his unsuccessful siege of Rhodes. According to popular but erroneous legend it stood astride the harbor with the ships passing between its legs. Its actual location was on a promontory overlooking the harbor, and the representational type is well known from images on coins of the same period. Among colossuses of later times the Great Buddha at Kamakura, Japan, and the Bartholdi Statue of Liberty in New York harbor are notable. Of two colossal figures of Christ in South America, one is at Rio de Janeiro, and the other, the CHRIST OF THE ANDES, on the boundary between Argentina and Chile.

Colquhoun, Patrick (kōhōon'), 1745-1820, British economist and statistician, b. Scotland. Active in civic affairs in Glasgow (where he founded the chamber of commerce) and London, he became known for his *Treatise on the Police of the Metropolis* (1795, 7th ed. 1806), written from his experience as a police magistrate. The most noted of his works is the *Treatise on the Population, Wealth, and Resources of the British Empire* (1814), in which he set forth statistical estimates of the distribution of national income. His figures, demonstrating the exploitation of the working classes, long influenced social and economic reformers.

Colt, Samuel, 1814-62, American inventor, b. Hartford, Conn. In 1835-36, he patented a revolving-breech pistol and founded at Paterson, N.J., the Patent Arms Company, which failed in 1842. An order for 1,000 revolvers from the U.S. government in 1847 in the Mexican War made possible the reestablishment of his business. He later built the Colt's Patent Fire-Arms Manufacturing Company factory at Hartford. Colt also invented a submarine battery used in harbor defense and a submarine telegraph cable. His revolving-breech pistol became so popular that today the word Colt is sometimes used as a generic term for the revolver. See biography by W. B. Edwards (1953).

Colter, John (kōl'tər), c. 1775-1813, American trapper and guide, b. Virginia. In 1803 he enlisted in the Lewis and Clark expedition and in 1806, on the return trip, was granted a discharge to join a party of trappers. The following year, on his way to St. Louis, he met the expedition of Manuel Lisa and was engaged to guide the party to the mouth of the Big Horn, where a post was built. Lisa sent Colter on a mission to the Crow Indians. His exact route is not certain, but he is believed to have crossed, alone and on foot, the Wind River Mts. and the Teton range, and he may have been the first white man to see the region that he traversed (now included in Yellowstone National Park). He was severely wounded in a battle between the Crow and Blackfoot Indians, but he escaped and made his way back to the post. In 1809 he guided an expedition of the St. Louis Missouri Fur Company to the Three Forks of the Missouri, returning to St. Louis in 1810. He furnished very valuable data to Clark, who was compiling maps for the report of the Lewis and Clark expedition. See biographies by Stallo Vinton (1926) and Burton Harris (1952).

colter, see PLOW.

Colton, Walter (kōl'tən), 1797-1851, American editor, writer, and clergyman, b. Rutland co., Vt. He became a naval chaplain in 1831. His books *Ship and Shore* (1835), *A Visit to Constantinople and Athens* (1836), and *Deck and Port* (1850) are based upon his naval experiences. In 1846 he was appointed chief judge of Monterey, Calif. and founded the *Californian*, California's first newspaper. Colton's book *Three Years in California* (1850) is an excellent historical account of this period.

Colton, city (1970 pop. 19,974), San Bernardino co., S. Calif., a suburb of San Bernardino, in a rich citrus and farm area, inc. 1887.

Coltrane, John, 1926-67, American jazz musician, b. Hamlet, N.C. He began playing tenor saxophone as an adolescent. Coltrane worked with numerous big bands before emerging in the mid-1950s as a major stylist while playing with Miles Davis. Originally influenced by Lester Young, Coltrane displayed dazzling technical brilliance coupled with ardent emotion in his playing. His style was at once sonorous and spare. From the late 1950s until his death he was considered the outstanding tenor and soprano saxophonist of the jazz avant-garde.

coltsfoot, Eurasian perennial herb (*Tussilago farfara*) of the family Compositae (COMPOSITE family), now a widespread weed in most northern lands. The scaly flower stalk bears a yellow flower head and downy, somewhat dandelionlike fruits. The leaves—appearing after the flowers—are large and vaguely heart shaped. Coltsfoot was long a popular cough remedy. Other plants are sometimes called coltsfoot, e.g., the related winter heliotrope, or sweet coltsfoot (*Petastites fragrans*), an ornamental. Coltsfoot is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Compositae.

colugo (kalōō'gō) see FLYING LEMUR

Colum, Padraic (pă'drīk kōl'am), 1881–1972, Irish-American author, b. Longford, Ireland. He was active in the IRISH LITERARY RENAISSANCE and helped to found the Abbey Theatre. His verse includes *Wild Earth* (1907), *The Story of Lowry Maen* (1937), and *Collected Poems* (1953). He also wrote children's stories based on Irish folklore. His wife was Mary (Maguire) Colum, 1880–1957, Irish-American critic, b. Sligo, Ireland. Her autobiography, *Life and the Dream* (1947), vividly describes various literary circles.

Columbia, Saint, or Saint Columcille (kōl'amkīl) [Irish, =dove of the church], 521–97, Irish missionary to Scotland, called the Apostle of Caledonia. A prince of the O'Donnells of Donegal, he was educated at Moville and Clonard. In Ireland he founded the monastery schools of Derry (545), Durrow (553), and Kells (c. 554). In 563, Columbia and several companions sailed to evangelize Scotland. They landed at IONA, where they established their center. Thence they went about the Highlands and the northern Lowlands spreading the gospel. Before Columbia's death N. Scotland was entirely Christian. St. Columba ranks with St. Patrick and St. Bridget as one of the three patron saints of the Irish, he is supposed to be buried with them at Downpatrick. Feast: June 9. See Hugh De Blacam, *The Saints of Ireland* (1942).

Columban, Saint (kalūm'ban), c.540–615, Irish missionary to the continent of Europe, also called Columbanus. He was trained in the abbey at Bangor. He and 12 companions, including St. Gall, sailed to France (c.585), where they set out to eradicate the general impiety that had grown up under the successors of Clovis. He went into seclusion in the Vosges, and c.590 he founded the abbey at Luxeuil. His Celtic practices and austerities eventually alienated both ecclesiastical and civil powers. Involved in the hostility between Queen Brunhilda and the Frankish bishops, he was generally feared by them all and was exiled. He went (610) to Switzerland and to Brengenz, seeking to reestablish Christianity there. Hostile reaction caused him to go (612) to Milan. At Bobbio he set up an abbey. There he died and lies buried. St. Columban was a considerable scholar, and all his foundations became known for their learning. He composed a rule for monks, which was later completely replaced by the longer and less austere rule of St. Benedict. Feast: Nov. 21 and, in Ireland, Nov. 23. See the classic work of Montalembert, *The Monks of the West* (1861), Francis MacManus, *Saint Columban* (1962), Brendon Lehan, *The Quest of Three Abbots* (1968).

Columbia 1. City (1970 pop. 58,804), seat of Boone co., central Mo.; inc. 1826. The trade center of a farm and coal area, it is best known as the seat of the Univ. of Missouri and Stephens College. The Missouri School of Religion and a junior college are also there. The city is a medical center, with the university hospital, a state cancer hospital, and a state regional mental health clinic. There are houses dating from c.1820. 2. Industrial borough (1970 pop. 11,237), Lancaster co., SE Pa., on the Susquehanna River, settled by Quakers c.1730, inc. 1814. The borough was originally called Wright's Ferry, its name was changed in 1789 when it narrowly missed Congressional selection as the permanent U.S. capital. One of the world's largest concrete arch bridges spans the Susquehanna there. 3. City (1970 pop. 113,542), state capital, and seat of Richland co., central S.C., at the head of navigation on the Congaree River, inc. 1805. It is the largest city in the state and an important trade and commercial point in the heart of a rich farm region. Its industries include printing and the manufacture of textiles, clothing, plastics, electronic equipment, office machinery, and glass and stone products. A trading post flourished nearby in the early 18th cent. In 1786 the site was chosen for the new state capital because of its central location, the legislature first met in its new quarters in 1790. During the Civil War, Sherman's army entered Columbia on Feb. 17, 1865. That night most of the city was burned by drunken Union sol-

diers and was almost totally destroyed. An educational center, Columbia is the seat of the Univ. of South Carolina, Benedict College, Columbia College, a Lutheran theological seminary, and a Bible college. Also in the city are the state penitentiary, a state hospital, and a U.S. veterans hospital. Notable buildings include the statehouse (begun 1855, damaged in 1865, completed 1901), Woodrow Wilson's boyhood home (1870), and several antebellum houses. Also of interest are the South Carolina Archives Building, the Columbia Museum of Art and Science, and the Midlands Exposition Park, with historical exhibits. Adjacent to the city is U.S. Fort Jackson, a major infantry training center. Lake Murray (formed by the dammed Saluda River) is nearby. 4. City (1970 pop. 21,471), seat of Maury co., central Tenn., on the Duck River, inc. 1817. Once a noted mule market and racing horse center, it is now the trade and processing hub of a fertile area producing beef cattle and burley tobacco and a shipping point for the region's limestone and phosphate deposits. Columbia's many fine antebellum homes include the James K. Polk House (1816). A junior college and a state vocational training center are there. A national jubilee for Tennessee walking horses is held in the city every June.

Columbia, river, c.1,210 mi (1,950 km) long, rising in Columbia Lake, SE British Columbia, Canada. It flows first NW in the Rocky Mt. Trench, then hooks sharply about the Selkirk Mts. to flow S through Upper Arrow Lake and Lower Arrow Lake and receive the Kootenai River (spelled Kootenay in Canada) before entering the United States after a course of 465 mi (748 km). It continues S through Washington and just below the mouth of the Spokane River is forced by lava beds to make a great bend westward before veering south again, running the while entrenched in a narrow valley through the Columbia Plateau. Its chief tributary, the Snake River, joins it just before it turns west again. The Columbia then forms part of the Washington-Oregon border before entering the Pacific Ocean through a wide estuary W of Portland, Oregon. The Columbia River has created regal gorges by cutting through the Cascades and the Coast Ranges, it is fed by the Cowlitz and Willamette rivers, which drain the Puget trough between those ranges. Grand Coulee, now a reservoir in the COLUMBIA BASIN PROJECT, was a former stream channel of the Columbia River. It was created during the Ice Age when the Columbia's course was blocked by ice, forcing it to cut a new channel through the Columbia Plateau. When the ice receded the river resumed its former channel. The Columbia River, commanding one of the great drainage basins of North America (c. 259,000 sq mi/670,800 sq km), was discovered by Robert Gray, an American explorer, in 1792 and is named for his vessel, the *Columbia*. It was first actually entered by a British naval officer, William R. Broughton, later the same year. Long before this time the Indians were fishing salmon from the river, today fish are still caught there, but heavy settlement along the river and its tributaries, the construction of dams, and human use have reduced the salmon runs. The first whites to arrive overland were the members of the Lewis and Clark expedition and the fur traders (notably David Thompson of the North West Company and the founders of Astoria). The river was the focus of the American settlement that created Oregon, and the river was itself sometimes called the Oregon River or the River of the West. Irrigation was begun early, and some tributaries were used to water cropland and orchards, as in, e.g., the valleys of the Wenatchee and Yakima rivers. After 1932 plans gradually developed to use the Columbia River to its ultimate possibility and the Columbia basin project was established. Its purpose is to establish flood control, which would alleviate the destruction seen in the Columbia's greatest flood, that of 1894, and somewhat lesser but damaging floods, such as that of 1948, to improve navigation, to extend irrigation in order to make optimum use of the water of the Columbia and its tributaries, and to produce hydroelectric power to supply the Pacific Northwest. There are six Federal and five non-Federal dams on the Columbia River. Grand Coulee (the key unit of the Columbia basin project) and Chief Joseph Dam, on the river's upper course, provide power, flood control, and irrigation. Priest Rapids, Wanapum, Rock Island, Rocky Reach, and Wells dams are on the middle course, all are among the largest non-Federal hydroelectric facilities in the United States. Bonneville, The Dalles, John Day, and McNary dams, on the lower course, were designed as power, flood control, and navigation projects, these dams

provide a 328-mi (528-km) slack-water navigation channel up the Columbia River from the Pacific Ocean to the Snake River. With these Federal projects and non-Federal dams on the Columbia, hydroelectric plants on the river have a potential generating capacity of about 21 million kw. The development of hydroelectric power has had a significant effect on the economic pattern of the Pacific Northwest. See U.S. Dept. of the Interior, Bureau of Reclamation, *The Columbia River* (1947), J. V. Krutilla, *The Columbia River Treaty, The Economics of an International River Basin Development* (1967).

Columbia, District of: see WASHINGTON, D.C.

Columbia basin project, central Wash., a multi-purpose development of the U.S. Bureau of Reclamation providing irrigation, hydroelectric power, and flood control. Its key unit, the GRAND COULEE DAM, provides the project with power and pumps the waters of the Columbia River into an irrigation system comprising a series of lakes, reservoirs, and numerous canals. Irrigation was begun in 1948 and will eventually cover more than 1,000,000 acres (404,700 hectares) on the Columbia plateau S of Grand Coulee Dam. In 1969 the project had an installed hydroelectric power generation capacity of 2,333,000 kw. O'Sullivan Dam (200 ft/61 m high, 19,000 ft/5,791 m long, completed 1949) on Crab Creek, the project's southernmost dam, is one of the largest earthfill dams in the United States and impounds Potholes Reservoir.

Columbia College: see COLUMBIA UNIV.

Columbia Heights, city (1970 pop. 23,997), Anoka co., SE Minn., a residential suburb adjoining Minneapolis, on the Mississippi River, inc. 1921. It has many varied manufactures.

Columbian Exposition: see WORLD'S COLUMBIAN EXPOSITION.

Columbia Plateau, physiographic region of North America, c.100,000 sq mi (259,000 sq km), NW United States, between the Rocky Mts. and the Cascade Range in Washington, Oregon, and Idaho. Most of the plateau is underlain by deposits, more than 10,000 ft (3,048 m) thick in places, of lava (mainly basalt) interbedded with sedimentary rock, older rocks outcrop in the Blue and Wallowa mts. Young lavas, scattered cinder cones, volcanic ash, and barren landscapes (including CRATERS OF THE MOON NATIONAL MONUMENT) are features of the Snake River plain in the south. Older, decayed lavas, much modified by accumulations of loess, occur in the north in the Columbia basin section, coulees (dry river canyons) and scablands (extensively eroded basalt surfaces), both carved by glacial meltwaters, are features of the region. The Columbia Plateau is an important agricultural and grazing area and is a major source of hydroelectric power.

Columbia sheep, medium-wool breed developed in the United States using Lincoln and Rambouillet sheep crosses. The breed was developed primarily for the Western ranges but is also used successfully in farm flocks. Columbias are white-faced, hornless, and relatively large in size and are prolific breeders.

Columbia University, mainly in New York City, founded 1754 as King's College by grant of King George II. Its first president was Samuel JOHNSON (1696–1772), a clergyman, who held classes in the schoolhouse of Trinity Church. The administration of his successor, Myles COOPER, was interrupted by the American Revolution, the college was closed but was reopened as Columbia College (1784). Title was first vested in the regents of the Univ. of the State of New York but in 1787 it was transferred to the trustees of the college, who elected William Samuel JOHNSON president. In 1857, under Charles King (1789–1867), the college moved to a site at Madison Ave. and 49th St., in 1897, under Seth Low, the move was made to Morningside Heights. The gradual addition of professional and graduate schools resulted in the assumption of the name Columbia Univ. in 1896, in 1912 the name became Columbia Univ. in the City of New York. Columbia College remained the undergraduate school. The school of medicine (est. 1767) was absorbed into the independent College of Physicians and Surgeons (chartered 1807), which in turn was absorbed into the university in 1891. Also included in the university are the schools of law (1858), architecture (1896), and engineering (1896), the school of mines (founded 1864 now included in the school of engineering), and the three graduate faculties—political science (1880), philosophy (1890), and pure science (1892). The university system includes Teachers College (founded 1888, chartered 1889), Barnard College for women (est. 1889), the College of Pharmacy

(est 1892), and the Columbia School of Social Work (formerly the New York School of Social Work, est 1898 as a summer school, affiliated with Columbia in 1940 and included within the university in 1959). The school of journalism was established in 1912 and that of business in 1916. In addition there are schools of public health, library service, international affairs, and the School of General Studies (est 1947, adult undergraduate college, formerly the university extension, est 1904). Much of Columbia's work in the fields of political science and international relations is carried on through a large group of research institutes (e.g., the East Asian, the European, and the Russian institutes). At Irvington-on-Hudson, N.Y., are the university's botanical and biological field stations. At Palisades, N.Y., the university operates the Lamont Geological Laboratory, which has extensive facilities for research in geophysics, geochemistry, and oceanography. The university library system, among the nation's largest, has many important manuscripts and rare book collections. Columbia is affiliated with the Marine Biological Laboratory at Woods Hole, Mass. Notable presidents of Columbia include F. A. P. BARNARD, Nicholas Murray BUTLER, and Dwight D. Eisenhower. Grayson Kirk was president from 1953 to 1969 and was succeeded by Andrew Cordier. In 1970, William J. McGill was appointed president. Columbia Univ. Press was founded in 1893. For histories of the various schools, see the volumes published in the Bicentennial series of Columbia Univ. See J. L. Avorn, et al., *Up Against the Ivy Wall* (1969), *University on the Heights*, ed. by Wesley First (1969).

Columbine. see COMMEDIA DELL'ARTE

columbine (köl'ambīn), any plant of the genus *Aquilegia*, perennials of the family Ranunculaceae (BUTTERCUP family), popular both as wild flowers and as garden flowers. Columbines have delicate and attractive foliage and flower petals with long spurs that secrete nectar. The common Eastern red-and-yellow-flowered wild columbine (*A. canadensis*), frequenting rocky places, is also called rockbell, it is a favorite of hummingbirds, and the Indians made an infusion of the seeds for headache and fever. The blue-and-white-flowered *A. coerulea* of the Rockies is the state flower of Colorado. The common European columbine (*A. vulgaris*), blue, white, or purple flowered and escaped from gardens in the United States, has been the source of many of the garden kinds—some double and of various soft colors. Columbine is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Ranunculales, family Ranunculaceae.

columbium, former name of the chemical element NIOBIUM.

Columbus, Christopher, Ital. *Cristoforo Colombo* (krēstō'fōrō kölōm'bō), Span. *Cristóbal Colon* (krēstō'bāl kölōn'), 1451-1506, discoverer of America, b. Genoa, Italy. He spent some of his early years at his father's trade of weaving and later became a seaman on the Mediterranean. Shipwrecked near the Portuguese coast in 1476, he made his way to Lisbon, where his younger brother, Bartholomew, an expert chart maker, lived. Columbus, too, became a chart maker for a brief time in that great maritime center during the golden era of Portuguese exploration and discovery. Engaged as a sugar buyer in the Portuguese islands off Africa (the Azores, Cape Verde, and Madeira) by a Genoese mercantile firm, he met pilots and navigators who believed in the existence of islands farther west. It was at this time that he made his last visit to his native city, but he always remained a Genoese, never becoming a naturalized citizen of any other country. Returning to Lisbon, he married (1479?) the wellborn Dona Filipa Perestrelo e Moniz. By the time he was 31 or 32, Columbus had become a master mariner in the Portuguese merchant service. It is thought by some that he was greatly influenced by his brother, Bartholomew, who may have accompanied Bartholomew Diaz on his voyage to the Cape of Good Hope, and by Martin Alonso Pinzon, the pilot who commanded the *Pinta* on the first voyage. Columbus was but one among many who believed one could reach land by sailing west. His uniqueness lay rather in the persistence of his dream and his determination to realize this "Enterprise of the Indies," as he called his plan. Seeking support for it, he was repeatedly rebuffed, first at the court of John II of Portugal and then at the court of Ferdinand and Isabella of Spain. Finally, after eight years of supplication by Columbus, the Spanish monarchs, having conquered Granada, decided to risk the enterprise. On Aug. 3, 1492, Columbus sailed from Palos, Spain, with three small ships, the *Santa Maria*, commanded by Co-

lumbus himself, the *Pinta* under Martin Pinzón, and the *Niña* under Vicente Yáñez Pinzón. After halting at the Canary Islands, he sailed due west from Sept. 6 until Oct. 7, when he changed his course to the southwest. On Oct. 10 a small mutiny was quelled, and on Oct. 12 he landed on a small island (Watling Island, see SAN SALVADOR) in the Bahama Group. He took possession for Spain and, with impressed natives aboard, discovered other islands in the neighborhood. On Oct. 27 he sighted Cuba and on Dec. 5 reached Hispaniola. On Christmas Eve the *Santa Maria* was wrecked on the north coast of Hispaniola, and Columbus, leaving men there to found a colony, hurried back to Spain on the *Niña*. His reception was all he could wish, according to his contract with the Spanish sovereigns: he was made "admiral of the ocean sea" and governor general of all new lands he had discovered or should discover. Fitted out with a large fleet of 17 ships, with 1,500 colonists aboard, he sailed from Cadiz in Oct., 1493. His landfall this time was made in the Lesser Antilles, and his new discoveries included the Leeward Islands and Puerto Rico. The admiral arrived at Hispaniola to find the first colony destroyed by Indians. He founded a new colony nearby, then sailed off in the summer of 1494 to explore the southern coast of Cuba. After discovering Jamaica he returned to Hispaniola and found the colonists, interested only in finding gold, completely disorderly, his attempts to enforce strict discipline led some to seize vessels and return to Spain to complain of his administration. Leaving his brother Bartholomew in charge at Hispaniola, Columbus also returned to Spain in 1496. On his third expedition, in 1498, he was forced to transport convicts as colonists, because of the bad reports on conditions in Hispaniola and because the novelty of the New World was wearing off. He sailed still farther south and made his landfall on Trinidad. He sailed across the mouth of the Orinoco River (in present Venezuela) and realized that he saw a continent, but without further exploration he hurried back to Hispaniola to administer his colony. In 1500 an independent governor arrived, sent by Isabella and Ferdinand as the result of reports on the wretched conditions in the colony, and he sent Columbus back to Spain in chains. The admiral was immediately released, but his favor was on the wane, other navigators, including Amerigo VESPUCCI, had been in the New World and established much of the coast line of NE South America. It was 1502 before Columbus finally gathered together four ships for a fourth expedition by which he hoped to reestablish his reputation. If he could sail past the islands and far enough west he hoped he might still find lands answering to the description of Asia or Japan. He struck the coast of Honduras in Central America and coasted southward along an inhospitable shore, suffering terrible hardships, until he reached the Gulf of Darien. Attempting to return to Hispaniola, he was marooned on Jamaica. After his rescue, he was forced to abandon his hopes and return to Spain. It is true the Vikings (see LEIF ERICSSON and THORFINN KARLSEFNI) had previously discovered America (c. 1000), but their knowledge had been converted into saga, never acted upon by navigators, so that Columbus was no less a discoverer. Although his voyage was of great importance and marked the beginning of American history, Columbus died in neglect, almost forgotten. Historians have disputed for centuries his skill as a navigator, but it has been recently proved that with only dead reckoning Columbus was unsurpassed in charting and finding his way about unknown seas. See J. M. Cohen, comp., *The Four Voyages of Christopher Columbus* (1969), biographies by S. E. Morison (1942), Salvador de Madariaga (1967), and E. D. S. Bradford (1973).

Columbus 1 City (1970 pop. 155,028), seat of Muscogee co., W. Ga., at the head of navigation on the Chattahoochee River, settled and inc. 1828 on the site of a Creek Indian village. The second largest city in the state, Columbus is a port of entry situated at the foot of a series of falls that extend more than 30 mi (48 km) and provide extensive water power. An important industrial and shipping center with many giant textile mills (the first was built in 1838), it also has iron works, food-processing plants, and factories producing lumber, chemicals, crushed granite, furniture, hospital equipment, concrete, wood and rubber products, and beverages. Columbus, carved out of the wilderness, was built according to plan and remained a busy river port until the arrival of the railroads in the 1850s. Its river traffic has been revitalized with the completion of a series of locks and dams providing access to the Gulf of Mexico.

During the Civil War, Columbus was an important Confederate industrial center. It was captured by Federal troops one week after Lee's surrender at Appomattox. Its industrial growth received added impetus in the early 20th cent. with the development of hydroelectric power plants. There are many antebellum homes in the city, and its oldest section has been marked for restoration and preservation. Columbus College is there, and just south of the city is Fort Benning. 2 City (1970 pop. 26,457), seat of Bartholomew co., S. central Ind., on the East Fork of the White River, inc. 1821. Its many manufactures include automotive parts, diesel engines, castings, metal furniture, electric controls, and plastic components. In the Civil War, Columbus served as a depot for Union armies. Both the railroads and the war brought industries, which remain to this day. The city is known for its outstanding architecture, including buildings designed by world famous architects from the late 1930s onward. 3 City (1970 pop. 25,795), seat of Lowndes co., NE Miss., on the Tombigbee River, inc. 1821. The trade, processing, and shipping center of a large cotton, livestock, dairy, and timber area, it also has marble works and garment factories. Franklin Academy, the first free school in the state, now part of the public school system, was opened in 1821. Mississippi State College for Women and Columbus Air Force Base are there. A pilgrimage for tourists to the city's many beautiful antebellum homes is conducted each year. 4 City (1970 pop. 15,471), seat of Platte co., E. central Nebr., in a prairie region, at the confluence of the Loup and Platte rivers, inc. 1857. It is a railroad, manufacturing, and trade center for a livestock, dairy, and grain area and is the headquarters for the Loup River power project. A junior college is there. 5 City (1970 pop. 540,025), state capital and seat of Franklin co., central Ohio, on the Scioto River, inc. as a city 1834. It is a port of entry, a rail, highway, and air focal point, and a major industrial and trade center in a rich farm region. Its many manufactures include household appliances, aircraft and missiles, automatic controls, foundry and machine-shop products, glass items, processing equipment, and coated fabrics. Columbus was laid out as state capital in 1812, but did not take over the government from Chillicothe until 1816. Its growth was stimulated by the development of transportation facilities—a feeder canal to the Ohio and Erie Canal, which was opened in 1831, the National Road, which reached the city in 1833, and the railroad, which arrived in 1850. Today the city is the seat of Ohio State Univ., Capital Univ., Ohio Dominican College, a business university, state schools for the deaf and blind, and Battelle Memorial Institute (for industrial research in metallurgy, the graphic arts, ceramics, and other fields). Landmarks include the state capital, the state office building, with the state library, the Columbus Gallery of Fine Arts, the library and museum of the state archaeological and historical society, the headquarters of the American Rose Society, with one of the world's largest rose gardens, Camp Chase Confederate cemetery, with the graves of soldiers who died in the Civil War prison camp there, and the vast state fair grounds. Also in the city are U.S. Fort Hayes (est. 1863) and a state penitentiary. Columbus has an international airport. See H. S. Hunker, *Industrial Evolution of Columbus, Ohio* (1958), R. D. McKenzie, *The Neighborhood: A Study of Local Life in the City of Columbus, Ohio* (1923, repr. 1970).

Columbus Day, holiday commemorating Christopher Columbus's discovery of America. It has been traditionally celebrated on Oct. 12 throughout most of the United States, parts of Canada, and in several of the Latin American republics. In the United States, however, since the observation in 1971 of the Uniform Holiday Act, it is celebrated on the Monday nearest to Oct. 12.

Columella, Saint. see COLUMBA, SAINT

Columella (Lucius Junius Moderatus Columella), fl. 1st cent. A.D., Latin writer on agriculture, b. Gades (now Cadiz), Spain. Of his work there remains the 12-volume *De re rustica*, treating general husbandry, the care of domestic animals, and farm management. The 10th book, modeled on Vergil, is in hexameters. A short essay on trees also survives. Columella's Latin is facile and elegant, and his information is surprisingly practical and accurate.

column, vertical architectural support, circular or polygonal in plan. A column is generally at least four or five times as high as its diameter or width, sturdier freestanding masses of masonry are usually called piers or pillars. The shape, proportions, and materials of columns vary widely. Columns arranged

in a row form a colonnade. Early forms of masonry columns can be seen in the rock-cut tombs at Beni Hassan in Egypt, with their polygonal shafts and block capitals. In fully developed Egyptian architecture the columns were of gigantic size, spaced very closely together, and were reserved for inner courtyards and halls. In the Aegean area, in pre-Hellenic times, the column type known to have been used is one with a cushionlike cap and with its shaft tapering downward. Subsequent types were the archaic forms of Doric, developed by the Dorians after their coming (before 1000 B.C.) into the region. By the 7th cent. B.C. this Greek Doric had been established in its design. The columns of classical architecture represent the attempt to design proportionings and details that would create maximum structural harmony. It is in the Greek temples of the Periclean Age (5th cent. B.C.), notably in the Parthenon, that the ideal was obtained. In Greek, Roman, and Renaissance architecture the various column types, taken together with the entablatures that they support, form the classical **ORDERS OF ARCHITECTURE**. The classical column has the three fundamental elements of base, shaft, and capital. The shaft has a gradual upward tapering (entasis), and the capital that crowns it provides a decorative and structural transition between the circular column and the rectangular entablature. The Doric, Ionic, and Corinthian column types advanced toward perfect proportions and details and formed the basis for the columnar architecture of the Romans. Although Greek columns always had vertical channels or flutes cut in their shafts, those of the Romans were often without them. In Greek buildings the columns were usually structurally indispensable, but the Romans and later the Renaissance and modern architects used them often also as a decorative feature, mostly following fixed rules of proportions. The columns of Romanesque, Byzantine, and Gothic buildings were usually structural elements and were without canons of proportioning. The capitals of the Romanesque and Gothic were often variously decorated with plant and animal forms. The columns of Chinese and Japanese architecture are circular or polygonal wood posts, with bases but without capitals, having instead an ornamented projecting bracket. In Indian architecture columns exhibit great variety of detail shafts, bases, and capitals are often intricately ornamented. In modern construction most columns are of either steel or reinforced concrete. See **DORIC ORDER**, **IONIC ORDER**, **CORINTHIAN ORDER**, **CAPITAL**.

columnist, newspaper, the writer of a department appearing regularly in the press, usually under a constant heading. Although originally humorous, the column in many cases has supplanted the editorial for authoritative opinions on world problems. Usually independent of the policy of his paper, the columnist is allowed to criticize political and social institutions as well as persons. Well-known American columnists include Eugene Field, George Ade, Bert Leston Taylor (8 L T.), Finley Peter Dunne, Don Marquis, Heywood Brown, Ernie Pyle, F. P. Adams (F. P. A.), Drew Pearson, Dorothy Thompson, Arthur Krock, David Lawrence, Westbrook Pegler, Walter Lippmann, James Reston, Joseph and Stewart Alsop, Russell Baker, Mary McGroarty, William F. Buckley, Tom Wicker, and Art Buchwald. Noted columnists in other newspaper departments include the gossip columnists Walter Winchell, Louella Parsons, and Suzy Knickerbocker, advice-to-the-lovelorn columnists Dorothy Dix, Ann Landers, and Abigail Van Buren, economic columnists Paul Samuelson and Sylvia Porter, and sports columnists Grantland Rice, Paul Gallico, and Red Smith.

Colville, river, c. 375 mi (600 km) long, rising in the De Long Mts. of the Brooks Range, NW Alaska, and flowing across the tundra, east then north, to the Arctic Ocean. All of its major tributaries rise on the north slope of the Brooks Range. The river, frozen for most of the year, floods each spring as ice on its upper course melts. Umiat is the chief village along its banks. Coal, oil, and natural gas are found in the valley.

Colville Indians, North American Indians whose language belongs to the Salishan branch of the Algonquian-Wakashan linguistic stock (see **AMERICAN INDIAN LANGUAGES**). Reduced to a few hundred by 1872, they were placed on a reservation in NE Washington, since that time their numbers have markedly increased, so that by the 1970s they numbered some 3,000.

Colvin, Sir Sidney (kôl'vin), 1845-1927, English man of letters. Slade professor of fine arts at Cambridge and keeper of prints at the British Museum, he was a friend of Robert Louis Stevenson, whose works and

letters he edited. Colvin wrote several studies on literature and art, including *Early Engraving and Engravers in England* (with A. M. Hind, 1905) and *John Keats: His Life and Poetry* (1917). See his *Memories and Notes of Persons and Places* (1921), E. V. Lucas, *The Colvins and Their Friends* (1928, repr. 1971).

Colwyn Bay (kôl'win), municipal borough (1971 pop. 25,535), Denbighshire, N Wales. It is a popular seaside resort. In 1974, it became part of the new nonmetropolitan county of Clwyd.

coly: see **MOUSEBIRD**.

Colyn, Alexander: see **COLINS, ALEXANDER**.

coma, deep state of unconsciousness from which a person cannot be aroused even with the most painful stimuli. It may be caused by severe head or brain injury, **APOPLEXY**, **DIABETES**, poisoning with morphine or barbiturates, **SHOCK**, or **HEMORRHAGE**. It occurs just before death in many diseases. It is dangerous to force food, fluids, or any medication by mouth on a comatose patient. It is important to keep air passages open. Treatment is directed to the cause of the condition.

coma, in astronomy see **ABERRATION OF STARLIGHT**, **COMET**.

Comanche Indians, North American Indians belonging to the Shoshonean group of the Uto-Aztecan branch of the Aztec-Tanoan linguistic stock (see **AMERICAN INDIAN LANGUAGES**). They originated from a Basin-type culture and eventually adopted a Plains culture. They separated from the Shoshone Indians and migrated southward in the late 1600s, appearing in New Mexico around 1705. In the late 18th cent. and early 19th cent. their range included SE Colorado, SW Kansas, W Oklahoma, and N Texas. The Comanche were excellent horsemen and inveterate raiders, often pushing far S into Mexico. They were extremely warlike and effectively prevented white settlers from passing safely through their territory for more than a century. They are said to have killed more whites in proportion to their own numbers than any other Indian tribe. They were associated with the Kiowa, the Cheyenne, and the Arapaho in a loose confederacy. The Comanche, however, considered themselves superior to their associates, and their language served as the trade language for the area. The sun dance, a common feature among Plains Indians, was not an important part of Comanche culture; they probably introduced the peyote ritual to the Plains tribes. Never a large group despite their wide range, they were greatly reduced by warfare and disease. They now number approximately 3,000 on individually owned land in Oklahoma. See Ernest Wallace and E. A. Hoebel, *Comanches: The Lords of the South Plains* (1952), J. E. Harston, *Comanche Land* (1963), A. C. Greene, *The Last Captive* (1972), T. R. Fehrenbach, *Comanches: The Destruction of a People* (1974).

Comayagua (kômayä'wä), town (1961 pop. 8,473), W central Honduras. Founded in 1537, Comayagua was the most important city of colonial Honduras. In the political struggle following independence from Spain (1821), Comayagua, the Conservative stronghold, rivalled TEGUCIGALPA, seat of the Liberal faction. The cities alternated as capital of the republic, but in 1880 Tegucigalpa became the permanent capital. Today Comayagua is the center of an agricultural and mining region. It has a fine colonial cathedral and other colonial landmarks.

comb, toothed implement for arranging, confining, or ornamenting the hair. Specimens made of ebony, boxwood, bone, ivory, or metal have been found among the relics of ancient Egypt, Greece, and Rome. In the Middle Ages combs were not used by the mass of the people. The Renaissance saw the increased popularity of the comb for ornamental as well as for practical use. Still made by hand at that time, combs were delicately carved and jeweled. It was at that time also that tortoise shell was first used. With the coming of the perwig (c. 1660), combs became fashionable for men, as did the practice of combing one's hair in public. The first factory in the United States to manufacture combs was established (1759) at Newberry, Mass.; horn was the most popular material used. In modern methods of combmaking, a plate of a size sufficient for two combs is cut (usually with a die) so that the teeth of one comb are formed by the interstices of the other. The name also refers to tools for graining painted work, for pressing home the web in a primitive loom, and for carding or combing fibers in preparation for spinning.

Combe, William, 1741-1823, English satirist and miscellaneous writer, b. Bristol. His writing was mainly hack work, issued anonymously to avoid sei-

zure of the proceeds by his many creditors. He is chiefly remembered for the "Dr Syntax" series (3 vol., 1812-21), for which he wrote doggerel verse to accompany the illustrations of Thomas Rowlandson. See biography by H. W. Hamilton (1968).

Combes, Émile (ämêl' kôNb), 1835-1921, French statesman. An able politician of the left democratic group, he was minister of education under Leon Bourgeois (1895-96) and, succeeding René Waldeck-Rousseau, was (1902-5) premier and minister of interior and religion. Anticlericalism, growing out of the DREYFUS AFFAIR, was rampant, and Combes rigorously enforced the law of 1901 requiring religious associations to seek government authorization. He abolished religious education and initiated the separation of church and state in France; abrogation of the CONCORDAT OF 1801 was formalized in 1905 in a law introduced by Aristide BRIAND. Combes was a member of the Briand cabinet in World War I.

Combin, Grand (graN kôNbân'), peak, 14,164 ft (4,317 m) high, Valais canton, S Switzerland, in the Pennine Alps, near the Italian border.

combination, in business see **TRUST**.

combinations, in mathematics see **PROBABILITY**.

combine, harvesting machine that "combines" the operations of harvesting and **THRASHING** grain. Although its widespread use did not occur until the 1930s, the combine was in existence as early as 1830. The original combines were traction-powered and were drawn by horses, or later, driven by steam and internal-combustion engines. Self-propelled units appeared in the 1940s and are rapidly being adopted worldwide. Modern units feature dust-free, air-conditioned cabs and can handle up to 100 acres (41 hectares) of grain per day. Originally developed for cereal grains, the combine is now used for legumes, forage grasses, sorghum, and corn. The basic operations of a combine include cutting the standing crop, gathering it up, threshing the seed from the stem, separating out the chaff, collecting the seed in a hopper for delivery to a truck, and returning the straw to the ground. The combine has replaced the farm machines known as the **REAPER**, the binder, which cut and bound a harvested crop into bundles ready for threshing, and the **thresher**. See O. H. Friesen, *Combines Operation and Adjustment* (1972).

combing, process that follows **CARDING** in the preparation of fibers for spinning, lays the fibers parallel, and removes neps (short fibers). The modern combing machine is a specialized carding machine. Combing produces a fine sliver suitable for drawing out and spinning into strong, smooth yarn. The process used for long staple cottons and worsted yarn, is expensive, since up to 25% of the card sliver is eliminated. Hackling is a form of combing, often by hand, used for linen.

combining weight, the proportion (by weight) in which a chemical element combines with other elements to form compounds. The determination of combining weights was a very important part of early chemical endeavor. The atomic theory of John DALTON (see **ATOM**) was based in part on his determinations of combining weights, which he called atomic weights. Combining weights were usually measured by early chemists on a scale in which hydrogen had a combining weight of 1. See **EQUIVALENT WEIGHT**.

comb jelly, common name for oval transparent organisms of the phylum **CTENOPHORA**, especially of the genus *Pleurobrachia*.

combustion, rapid chemical reaction of two or more substances with a characteristic liberation of heat and light, it is commonly called burning. The burning of a fuel (e.g., wood, coal, oil, or natural gas) in air is a familiar example of combustion. Combustion need not involve oxygen, e.g., hydrogen burns in chlorine to form hydrogen chloride with the liberation of heat and light characteristic of combustion. Combustion reactions involve **OXIDATION AND REDUCTION**. Before a substance will burn, it must be heated to its ignition point, or kindling temperature. Pure substances have characteristic ignition points. Although the ignition point of a substance is essentially constant, the time needed for burning to begin depends on such factors as the form of the substance and the amount of oxygen in the air. A finely divided substance is more readily ignited than a massive one, e.g., sawdust ignites more rapidly than does a log. The vapors of a volatile fuel such as gasoline are more readily ignited than is the fuel itself. The rate of combustion is also affected by these factors, particularly by the amount of oxygen in the air. The nature of combustion was not always clearly understood. The ancient Greeks

The key to pronunciation appears on page xi

believed fire to be a basic element of the universe. It was not until 1774 that the French chemist A. L. LAVOISIER performed experiments that led to the modern understanding of the nature of combustion. See SPONTANEOUS COMBUSTION, HEAT OF COMBUSTION. See C. J. Hilado, *Smoke and Products of Combustion* (1973).

Comecon. see COUNCIL FOR MUTUAL ECONOMIC ASSISTANCE

Comédie Française (kōmādē' fraŋsēz') or **Theâtre Français** (tāā'trā fraŋsā'), state theater of France, on the Rue de Richelieu, Paris. It is sometimes known as La Maison de Molière. The Comédie Française was officially established by Louis XIV (1680), his decree merging the two French companies of comedians at Paris, the troupe of the Hôtel Guenegaud (see MOLIERE and BÉJART) and the troupe of the HÔTEL DE BOURGOGNE. The following year an annual grant of 12,000 livres was allotted from the royal treasury, and a new theater was built for the company. In the Revolution its actors were scattered and the theater closed. By decree of Napoleon in 1803 the institution was revived, and the company was organized along lines that have been continued into the present. The system has no stars, all the permanent members, called *sociétaires* or associates, enjoy the same status, roles being apportioned by common agreement. The company continues to perform the finest works of French drama in a varied, yet sometimes heavily traditional repertory. In 1900 fire destroyed the historic building, but most of the works of art and all the archives were saved, and the theater was rebuilt.

comedy, literary work that aims primarily at amusement. Unlike TRAGEDY, which seeks to engage profound emotions and sympathies, comedy strives to entertain chiefly through criticism and ridicule of man's customs and institutions. Although usually used in reference to the drama (see DRAMA, WESTERN, ORIENTAL DRAMA), the term is also applied to such non-dramatic works as Dante's religious poem, *The Divine Comedy*. Dramatic comedy grew out of the boisterous choruses and dialogue of the fertility rites of the feasts of the Greek god Dionysus. What became known to theater historians as Old Comedy in ancient Greece was a series of loosely connected scenes (using a chorus and individual characters) in which a particular situation was thoroughly exploited through FARCE, fantasy, satire, parody, and political propaganda, the series ending in a lyrical celebration of unity. Reaching its height in the brilliantly scathing plays of Aristophanes, Old Comedy gradually declined in favor of a less vital and imaginative drama. Middle Comedy, of which no plays are extant, emphasized social themes. In New Comedy, generally considered to have begun in the mid-4th cent. B.C., the plays were more consciously literary, often romantic in tone, and decidedly less satirical and critical. Menander was the most famous writer of New Comedy and was closely imitated by the Latin dramatists Plautus and Terence. During the Middle Ages the Church strove to keep the joyous and critical aspects of the drama to a minimum, but comic drama survived in medieval folk plays and festivals, in the Italian *COMMEDIA DELL'ARTE*, in mock liturgical dramas, and in the farcical elements of miracle and morality plays. With the advent of the Renaissance, a new and vital drama emerged. In England in the 16th cent. the tradition of the INTERLUDE, developed by John Heywood and others, blended with that of Latin classic comedy, eventually producing the great Elizabethan comedy. Finding its early expression in the work of Nicholas Udall and John Lyly, Elizabethan comedy reached its highest expression in the plays of Shakespeare and Ben Jonson. Shakespeare, whose comedies ranged from the farcical to the tragicomic, was the master of the romantic comedy, while Jonson, whose drama was strongly influenced by the classical tenets, wrote caustic, rich satire. In France, after the Middle Ages, the classical influence was combined with that of the *commedia dell'arte* in the drama of Molière, one of the greatest comic and satiric writers in the history of the theater. This combination is also present in the plays of the Italian Carlo Goldoni. After a period of suppression during the Puritan Revolution, the English comic drama reemerged with the witty, frequently licentious, consciously artificial comedy of manners of Etherege, Wycherley, Congreve, and others. At the close of the 17th cent., however, such stern reaction had set in against the bawdiness and frivolity of the Restoration stage that English comedy descended into what has become known as sentimental comedy. This drama, which sought more to evoke tears than laughter, had its

counterpart in France in the *comédie larmoyante*. In the later 18th cent. a resurgence of the satirical and witty character comedies was found in the plays of Sheridan and Goldsmith. After an almost complete lapse in the 19th cent., good comedy was again brought to the stage in the comedies of manners by Oscar Wilde and in the comedies of ideas by George Bernard Shaw. In the late 1880s the great Russian dramatist Anton Chekhov began writing his subtle and delicate comedies of the dying Russian aristocracy. The 20th cent. has witnessed several distinct trends in comedy: the sophisticated and witty comedy of manners, initiated by Wilde and carried on by Noel Coward, S. N. Behrman, Philip Barry and others, the romantic comic fantasy of such playwrights as James M. Barrie and Jean Giraudoux, the native Irish comedy of J. M. Synge, Lady Gregory, Sean O'Casey, Brendan Behan, and Brian Friel, the musical comedy, descending from 18th-century ballad operas and the comic operas of W. S. Gilbert and A. S. Sullivan (see MUSICALS), the slick, satirical, and professional comedy of George S. Kaufman, Moss Hart, and Neil Simon, the nihilistic, highly unconventional comedy, containing both comic and tragic elements, of dramatists of the theater of the absurd such as Eugene Ionesco and Samuel Beckett, and the so-called "black comedy," often concerning topics like racism, sexual perversion, and murder, of playwrights such as Joe Orton, Bruce Jay Friedman, and Jules Feiffer. For further information see separate entries on the dramatists mentioned in this article. See Elmer Blistein, *Comedy in Action* (1964), B. N. Schilling, *The Comic Spirit* (1965), J. W. Krutch, *Comedy and Conscience after the Restoration* (rev. ed. 1949, repr. 1967), H. T. E. Perry, *Masters of Dramatic Comedy* (1939, repr. 1968), Walter Sorell, *Facets of Comedy* (1972).

Comenius, John Amos (kōmē'nēās), Czech Jan Amos Komenský, 1592-1670, Moravian churchman and educator, last bishop of the Moravian Church. Comenius advocated relating education to everyday life by emphasizing contact with objects in the environment and systematizing all knowledge. He did not regard religion and science as incompatible. Teaching was to be in the vernacular rather than in Latin, and languages were to be learned by the conversational method. He worked for a universal system of education offering equal opportunities to women. His *Didactica magna* (1628-32, tr. by M. W. Keatinge, 1896, 2d ed., Pt. I, 1910, Pt. II, 1923, repr. 1967) contains an exposition of these principles. He also wrote *Janua linguarum reserata* (1631, tr. *The Gate of Tongues Unlocked*, 1659) and *Orbis sensualium pictus* (1658, tr. *The Visible World*, 1659), one of the earliest illustrated books for children. His collected works were first published in 1867. See biography by F. H. Hay (1973), S. S. Laurie, *John Amos Comenius* (1892, repr. 1973), W. S. Monroe, *Comenius and the Beginnings of Educational Reform* (1900, repr. 1971).

Comet [Gr., =long haired], celestial body of small mass consisting mainly of gases and moving under the sun's gravitational influence. Comets visible from the earth can be seen for periods ranging from a few days to several months. They were long regarded with awe and even terror and were often taken as omens of unfavorable events. Although the occurrence of many comets had been recorded, it was not until 1705 that the return of one was predicted. In that year Edmund Halley concluded that the comet observed in 1682 was the same one that had been described in 1531 and 1607, and he predicted that it would return again in late 1758 or early 1759. The comet returned in the spring of 1759 and again in 1835 and 1910 (see HALLEY'S COMET). Ordinarily a comet contains a small, bright nucleus surrounded by a nebulous envelope of luminous gases called the coma; this luminosity is caused by the molecules absorbing the ultra-violet radiation of the sun. According to the ice-conglomerate theory proposed by F. L. Whipple in 1949, the nucleus consists of ice and other frozen gases with particles of heavier substances interspersed throughout, thus being in effect a large, dirty snowball. As the comet approaches the sun, particles and gases from the nucleus and coma are driven off, usually forming a tail which can extend as much as 100 million mi (160 million km) in length. The tail, pushed by the solar wind, always streams out in the direction opposite the sun, i.e., it follows the head as the comet approaches the sun and precedes it as the comet passes perihelion (its closest point to the sun) and moves away. Near the sun a comet can change drastically in size and shape, with the head contracting as material flows into the tail, it may even split in

two, as Biela's comet did in 1846. The average size of the comet head is about 80,000 mi (130,000 km) in diameter, while some as small as 10,000 mi (16,000 km) and as large as 1,400,000 mi (2,250,000 km) in diameter have been observed. Whereas the volume of a comet is enormous, its mass is estimated to be no more than one millionth that of the earth. Most of the mass is contained in the nucleus and coma. The nucleus itself is small, ranging from one mile to a few thousand miles in diameter. The origin of comets is still uncertain. They were once thought to have originated outside the solar system, however, modern theories suggest they were formed with the formation of the solar system and are permanent members of it. According to the storage-cloud hypothesis of J. H. Oort, a shell of more than 100 billion comets surrounds the solar system at a distance of as much as 150,000 times the distance from the earth to the sun. While in this huge storage cloud, the comets move very slowly, a passing star, however, may change their orbits enough to force some of them into the inner part of the solar system. Some comets appear to have parabolic orbits (see PARABOLA), these orbits may send them past the sun once and then back to the storage cloud. Of the 130 comets with known periods of revolution, about 60 revolve in highly elongated orbits with periods ranging from a hundred to thousands of years. The others return at shorter intervals. About 45 comets have periods of less than 10 years and reach aphelion (the orbital point farthest from the sun) near the planet Jupiter, these have been captured into their smaller orbits by Jupiter's gravitational attraction. As comets lose material with successive passages near the sun, they fade in brightness. Some may break up, leaving a stream of meteoroids (see METEOR) scattered over their orbital path, when the earth passes through this path, a meteor shower is observed. See B. M. Middlehurst, ed., *The Moon, Meteorites, and Comets* (1963), R. S. Richardson, *Gelting Acquainted with Comets* (1967), Willey Ley, *Visitors from Afar: The Comets* (1969).

comic strip, combination of cartoon with a story line, laid out in a series of pictorial panels across a page and concerning a continuous character or set of characters, whose thoughts and dialogues are indicated by means of "balloons" containing written speech. As a form of communication the comic strip medium goes back to the Middle Ages, with the BAYEUX TAPESTRY retracing the hostilities leading to the Battle of Hastings. In the 18th and early 19th cent., balloons were used regularly in the satirical cartoons of William Hogarth and Thomas ROWLANDSON, continuity was also utilized by Rowlandson in his *Tours of Dr. Syntax* (1812-21). The comic strip form can be employed to convey a variety of messages (e.g., advertisements). However, the term "comic strip" in its strictest sense refers to syndicated newspaper features that appear daily in single rows of three or four panels, printed in black and white, and weekly in two to four consecutive rows of panels, forming a page, and printed in color in the Sunday comic sections. The immediate ancestor of the newspaper comic strip was the CARTOON, popular in the late 19th cent. Although there is evidence of comic strips appearing in newspapers as early as 1892, it is the year 1896 that commonly marks the birth of the genre in the American press, with *The Yellow Kid* as its first true representative. This feature, consisting of the weekly antics of a little boy in a bright yellow nightgown, was created by Richard Felton Outcault for the Sunday supplement of Joseph Pulitzer's New York World. The popularity of *The Yellow Kid* resulted in an immediate increase in the World's circulation. William Randolph Hearst soon succeeded in hiring Outcault for his own New York Journal, while Pulitzer hired another artist, George LUKS, to continue the feature in the World. The resulting rivalry between the two *Yellow Kids* not only produced the phrase "yellow journalism," but also emphasized the powerful influence of the comic strip as a circulation builder for newspapers. Rudolph Dirks, in the *Katzenjammer Kids* (1897), was the first to make consistent use of a sequence of panels to tell his stories. With the creation of such pioneering strips as *Happy Hooligan* (1899), by Frederick Burr OPPER, Charles ("Bunny") SCHULTZ's *Foxy Grandpa* (1900), Outcault's *Buster Brown* (1902), and James SWINNERTON's *Little Jimmy* (1905), all the essential components of the comic strip (e.g., regularity of cast, use of sequence of panels and speech-balloons) were refined and securely established. During their early days, comic strips appeared exclusively as weekly features in the Sunday supplement. In 1907, Bud Fisher created the first successful daily

strip with his *Mutt and Jeff*. Because syndicates distributed plates of their comic features to many newspapers, the characters acquired national readership. The enormous influence of comic strips on the public was first demonstrated by "Buster Brown" fashions early in the 20th cent., and it is still evidenced today by the proliferation of "Peanuts" products. Until the mid-1920s comic strips were true to their name, since they were all intended to raise a laugh in the reader. In 1924, Roy Crane, with *Wash Tubbs* (later retitled *Captain Easy*), added an important new dimension to the comic strip: adventure and suspense—which had previously existed, but in burlesque form, in Charles W. Kahles's popular strip, *Hairbreadth Harry* (1906). Some of the earliest examples of this new genre—invariably drawn in a more realistic style than the early "funnies"—were *Tim Tyler's Luck* (1928), by Lyman Young, *Tarzan* (1929), first drawn by Harold Foster, and *Buck Rogers* (1929), by Phil Nowlan and Dick Calkins. These led to such enduring classics as Chester Gould's *Dick Tracy* (1931), Milton Caniff's *Terry and the Pirates* (1934), and Alex Raymond's *Flash Gordon* (1934), and culminated in the most consciously artistic strip of all, Harold Foster's *Prince Valiant* (1937). Some comic strips have proved effective vehicles for political messages. *Little Orphan Annie* (1924), by Harold Gray, extolled free enterprise and conservatism, while the satirical *Pogo* (1949), by Walt Kelly, aimed barbs at the enemies of liberalism. Social satire and intellectual humor have made some strips favorites with adults and university students. *Little Nemo in Slumberland* (1906), by Winslow McCay and *Krazy Kat* (1911), by George Herriman were forerunners of these, and they led to Al Capp's *L'il Abner* (1934), *Pogo*, *Peanuts* (1950), by Charles SCHULZ, Johnny Hart's *B.C.* (1958), Brant Parker's and Johnny Hart's *Wizard of Id* (1964), and Russell Myer's *Broom Hilda* (1970). Experiments with book-length strips led, in the 1930s, to the comic book, a magazine aimed primarily at a juvenile audience—unlike comic strips, which are intended for the entire family—that at first reprinted entire episodes of newspaper strips but eventually evolved its own characters, e.g., *Superman* (1938), by Jerry Siegel and Joe Shuster, *Batman* (1939), by Bob Kane, and *Captain America* (1941), by Joe Simon and Jack Kirby. Adventure, crime, and war comics eventually elicited complaints from parents, teachers, and clergymen about the portrayal of violence and crime in a product intended for children. In 1954 publishers formed a Comics Code Authority to administer self-censorship standards, thus averting government action. One of the most significant developments of the 1960s was the emergence of comic strip clubs and associations, in the United States and in Europe, whose members collect vintage strips, write critical studies about them, and publish the results of their research in specialized journals. They hold conventions where classic comic material is bought, sold, and traded, and where panel discussions, slide shows, and lectures are given on the subject of comic strips. See Coulton Waugh, *The Comics* (1947), S. D. Becker, *Comic Art in America* (1959), George Perry and Alan Aldridge, *The Penguin Book of Comics* (1967), Pierre Couperie and M. C. Horn, *A History of the Comic Strip* (1968), Walter Herdeg and David Pascal, ed., *The Art of the Comic Strip* (1972).

Comilla (kōmīl'ā), town (1961 est. pop. 54,500), Bangladesh, on the Gumti River. An administrative center on the main railroad and highway linking Chittagong with Dacca, it is a collection point for hides and skins and has a noted cottage industry in cane and bamboo basketry. Comilla has three colleges affiliated with the Univ. of Dacca.

Commines, Philippe de (fēlēp' də kōmēn'), c. 1447–c. 1511, French historian, courtier, and diplomat. In 1472 he left the service of Charles the Bold of Burgundy to enter that of Louis XI of France, who rewarded him richly. After Louis's death he plotted against Charles VIII and was banished from court. He later regained favor, accompanied Charles to Italy, and was briefly ambassador to Venice. His *Memoires sur les regnes de Louis XI et de Charles VIII* (available in many editions and translations) is a historical and literary work of the highest rank. It contains striking portraits of Charles the Bold, Louis XI, and Charles VIII and is penetrating in its analysis of men, motives, and institutions. His name is also spelled Commines and Comynnes. See his memoirs, ed. by Samuel Kiser (2 vol., tr. 1968 and 1973).

Cominform (kōm'infōrm) [acronym for Communist Information Bureau], information agency organized in 1947 and dissolved in 1956. Its members were the Communist parties of Bulgaria, Czechoslovakia,

France, Hungary, Italy, Poland, Rumania, the Soviet Union, and Yugoslavia. The Cominform attempted to reestablish information exchanges among the European Communist parties that had lapsed since the dissolution (1943) of the COMINTERN. Its decisions were not binding, nor was membership obligatory for Communist parties. It was not a reconstitution of the Comintern, only a setting up of information contacts. Its chief function was the publication of materials designed to demonstrate the unity of its members. In 1948 the Cominform expelled the Yugoslav Communist party because of the defiance by Marshal TITO of Soviet supremacy. In 1956, as a gesture of reconciliation with Tito, the Cominform was dissolved.

Comintern (kōm'īntərn) [acronym for Communist International], name given to the Third INTERNATIONAL, founded at Moscow in 1919. Vladimir Ilyich Lenin feared a resurgence of the Second, or Socialist, International under non-Communist leadership. The Comintern was established to claim Communist leadership of the world socialist movement. The delegates to the first congress were mainly Russians, with some members of left-wing socialist splinter groups who happened to be in the Soviet Union and one German (who abstained on the crucial vote of establishing the organization). Gregory ZINOVIEV was the first president of the Comintern. The second congress laid down (1920) the "Twenty-one Conditions" for membership, firmly establishing a differentiation between the socialist parties of the center and the Communist parties of the left. The Comintern gained strength during the 1920s, but its efforts to foment revolution, notably in Germany, were unsuccessful. In 1935 the Comintern abandoned the membership policies established under the "Twenty-one Conditions" and began to form coalitions, or popular fronts, with bourgeois parties. In 1936, Germany and Japan concluded the so-called Anti-Comintern Pact, ostensibly to protect the world from the Third International. The pact was renewed in 1941 with 11 other countries as signatories. In order to allay the misgivings of its allies in World War II, the Soviet Union dissolved the Comintern in 1943. See K. E. McKenzie, *The Comintern and World Revolution, 1928-1943* (1964), M. M. Drachkovitch, ed., *The Comintern* (1966), Branko Lazitch and M. M. Drachkovitch, *Biographical Dictionary of the Comintern* (1973).

comma: see PUNCTUATION

Commack (kō'māk), uninc. town (1970 pop. 22,507), Suffolk co., SE N.Y., on central Long Island. It is chiefly residential.

Commagene (kōmājē'nē), ancient district of N. Syria, on the Euphrates River and S of the Taurus range, now in SE Asiatic Turkey. Its metropolis, Samosata, was founded by Samos, the king of Commagene, c. 150 B.C. The fertile agricultural district was made part of the Assyrian Empire and later of the Persian Empire. In the period after Alexander the Great, it gradually assumed independence under the Seleucid kings of Syria, and its governor, Ptolemy, revolted in 162 B.C., declaring absolute independence. The ruling dynasty of independent Commagene was related to the Seleucids. In 64 B.C., King Antiochus I, a Roman ally, had his territory enlarged with the addition of Commagene by Pompey, but when he aided the Parthians he was deposed in 38 B.C. by Antony. Commagene was annexed by Tiberius (A.D. 17) but a new king, Antiochus IV, was instated by Caligula (A.D. 38), was soon deposed, and then reinstated (A.D. 41) by Claudius. Finally Vespasian permanently annexed Commagene (A.D. 72). The territory was invaded by KHOSRU I of Persia in 542, but he withdrew the same year when his campaign was checked by BELISARIUS.

Commager, Henry Steele (kōm'ijər), 1902–, American historian, b. Pittsburgh, Pa. He received his Ph.D. from the Univ. of Chicago in 1928 and taught history at New York Univ. (1926–38) and Columbia (1938–56), where he was made adjunct professor in 1956, that same year he was appointed professor at Amherst. His writings, often in collaboration with other historians, are extensive. Among them are *The Growth of the American Republic* (with Samuel E. Morison, 1930, 6th ed., rev. and enl., 2 vol. 1969), *Theodore Parker* (1936, 2d ed. 1947, reissue 1960), *Our Nation* (with Eugene C. Barker, 1941), *Majority Rule and Minority Rights* (1943), *The American Mind* (1950), *Freedom, Loyalty, and Dissent* (1954), and *The Era of Reform* (1960). He edited *Documents of American History* (1934, 8th ed. 1968), *The Heritage of America* (with Allan Nevins, 1939, rev. and enl. ed., 1949), *Readings in American History* (with Allan Nevins, 1939), *America in Perspective*. The

United States through Foreign Eyes (1947), *The St. Nicholas Anthology* (1948), *The Spirit of 'Seventy-six* (with R. B. Morris, 1958), and *The Atlas of the Civil War* (1950). Commager is also editor of the multivolume "Rise of the American Nation" series. See the biographical essays in *Freedom and Reform*, ed. by H. M. Hyman and L. W. Levy (1967).

Commander Islands: see KOMANDORSKI ISLANDS, USSR

Commandments, Ten: see TEN COMMANDMENTS

commando, small military raiding and assault unit, first employed by the Boers in the South African War (1899–1902). However, it was not until 1940, when the British organized a number of such units, that the term came into wide use. Made up of hand-picked volunteers, specifically trained for dangerous work, these units were employed in missions throughout World War II. Some of the most celebrated of the commando operations were the raids on Field Marshal Rommel's headquarters (1941) and on St. Nazaire (1942) and the capture (1944) of the Dutch island of Walcheren. The U.S. army's ranger battalions were somewhat similar and were also popularly called commandos. After World War II, the American rangers and the British army's commandos were disbanded, but the British Royal Marine Commandos remained active and were employed in the Korean war and the Suez operation. During the Arab-Israeli conflicts, commando raids were common on both sides. See GUERRILLA WARFARE.

commedia dell' arte (kōm-mā'dēā dēl-lār'tā), popular form of comedy employing improvised dialogue and masked characters that flourished in Italy from the 16th to the 18th cent. Its influence on European drama is inestimable and can be seen especially in French pantomime and in the English harlequinade. Probable roots are found in the *Fabulae Atellanae* of the Oscans and Romans and in the Byzantine mimes of the Eastern Roman Empire. Little remains to evaluate the original performances, although *scenarii* (synopses of plot), *conceitti* (stock rhetorical speeches for every emotion), and *lazzi* (stock comic business that could be employed) are recorded. The ensemble companies generally performed in Italy, although a company called the *comédie-italienne* was established in Paris in 1661. The characters or "masks," in spite of changes over the years, retained much of their original flavor. Often the actor became so associated with his part that he used the name of his character in everyday life. Most important were the *zanni*, or servant types. They were the plot weavers, and their job was to arouse laughter. *Arlecchino*, or Harlequin, was the most famous of this type. An acrobat and a wit, he was always childlike and amorous. He wore a black, cat-like mask and motley colored clothes, which were later patterned with red, blue, and green diamonds. He carried a bat or wooden sword, the ancestor of the slapstick. His crony, *Brighella*, was more roguish and sophisticated. A cowardly villain, he would do anything for money. *Figaro* and *Molière's* *Scapino* are descendants of this type. *Pedrolino*, the martyr type, was a white-faced, moon-struck dreamer. The French *PIERROT* is his descendant. *Pagliaccio*, the forerunner of today's clown, was closely akin to *Pedrolino*. *Pulcinella*, as seen in the English *PUNCH AND JUDY* shows, was dwarfish and cruel, a humpback with a crooked nose, the deformed bachelor who chased pretty girls. *Pantalone* or *Pantaloon* was a caricature of the Venetian merchant, rich and retired, mean and miserly, with a young wife or an adventurous daughter. Wearing baggy trousers, he had a pointed beard, and his chin was thrust forward. *Il Dottore* (the doctor), his only friend, was a walking caricature of learning, pompous and fraudulent. He was dressed in black. He survives in the works of Molière. *Il Capitano* (the captain) was a caricature of the professional soldier, usually of the Spanish type, bold and swaggering, but cowardly. He was replaced by *Scaramuccia* or *Scaramouche*, who was much more agile. Dressed in black and carrying a pointed sword, he was the Robin Hood of his day. *The Inamorato* (the lover) went by many names. The matinee idol of his time, he had to be handsome and eloquent in order to speak the love declamations. He wore no mask. *The Inamorata*, whether she be *prima donna* or *seconda donna*, was his female counterpart. *Isabella Andreini* was the most famous. Her servant, or *soubrette*, usually called *Columbine*, was the beloved of Harlequin. Witty, bright, and given to intrigue, she developed, along with Harlequin, into such characters as Harlequine and *Pierrette*. *La Ruffiana* was an old woman, either the mother or a village gossip, who thwarted the lovers. *Cantarina* and *Ballerina* often took part in the comedy, but for the most part their

job was to add variety to the performance by singing, dancing, or playing a musical instrument. None of the women wore masks. The *Commedia dell'arte* survived the early 18th cent. only by means of its vast influence on written dramatic forms. See Allardyce Nicoll, *Masks, Mimes, and Miracles* (1931), K. M. Lea, *The Italian Popular Comedy* (2 vol., 1934, repr. 1962), Winifred Smith, *Commedia Dell'arte* (rev. ed. 1964), P. L. Duchartre, *The Italian Comedy* (tr. 1928, repr. 1965).

commensalism, relationship between members of two different species of organisms in which one individual is usually only slightly benefited, while the other member is not affected at all by the relationship. For example, some flatworms live attached to the gills of the horseshoe crab, obtaining bits of food from the crab's meals, the crab is apparently unaffected. In many cases commensalism cannot be distinguished from parasitism (see PARASITE). See also COMPETITION, SYMBIOSIS.

Commerce, city (1970 pop. 10,536), Los Angeles co., S. Calif., a suburb of Los Angeles, inc. 1960. An important transportation hub for S. California, Commerce is the home of several large corporations, manufactures range from telephones to chemicals. In 1927, Charles A. Lindbergh landed *The Spirit of St. Louis* at the old Vail Field in Commerce while on a nationwide tour following his transatlantic flight.

commerce, traffic in goods, usually conceived as nondomestic trade. Engaged in by all peoples from the earliest times, it has been carried on in some areas and by some peoples more than others, because of special advantages or aptness. The Egyptians, the Sumerians and later inhabitants of Mesopotamia, the Cretans, the Syrians, the Phoenicians, the Greeks, the Arabs, and the Western Europeans have excelled in commerce, tapping the resources of the East, Oceania, the Americas, and Africa. The center of commerce has shifted from the Mediterranean to the North Sea and the Atlantic. The Crusades did much to widen European trade horizons and prefaced the passing of trade superiority from Constantinople to Venice and other cities of N. Italy. In the 15th and 16th cent. with the sudden expansion of Portugal and Spain the so-called commercial revolution reached a climax. In N. and central Europe, the earlier supremacy of the Hanseatic League, the Rhenish cities, and the cities of N. France and Flanders was eclipsed by the rise of national states. Antwerp began its long career of glory when the Spanish were losing hegemony, and the Dutch briefly triumphed in the race for world commerce in the 17th cent. The Dutch in turn gave way to a British-French rivalry that by 1815 left Great Britain paramount. The Industrial Revolution of the 18th and 19th cent. further aided the development of commerce. The rise of the CHARTERED COMPANY under the auspices of the national state had much to do with the expansion of trade, as did the modern corporation, which later displaced the chartered company. World commerce was also aided materially by the invention of the astrolabe, the mariner's compass, and the sextant, by the development of iron and steel construction, by the application of steam to both land and water transport, and by the more recent development of communication devices such as the telephone, telegraph, cable, and radio and of inventions such as refrigeration, the gasoline engine, the electric motor, and the airplane. The theory of commerce as imposed by the national state has varied from the MERCANTILISM of the 17th and 18th cent. and the protective tariff of the 19th and 20th cent. to the free trade that Britain long upheld. After World War II recognition of the need for commercial expansion led to the creation of regional systems such as the COMMON MARKET. In general there was a twofold development. On the one hand there was a reduction of regional trade barriers. And on the other there was a tendency for the Communist and capitalist countries to bar trade with each other, by the 1970s, however, commerce between the two blocs had been greatly expanded. See Miriam Beard, *A History of Business* (2 vol., 1938, repr. 1962-63), H. L. Adelson, *Medieval Commerce* (1962), C. S. Belshaw, *Traditional Exchange and Modern Markets* (1965), William Culican, *The First Merchant Venturers* (1967), Jan Pen, *A Primer on International Trade* (1967), R. S. Lopez, *The Commercial Revolution of the Middle Ages* (1971).

Commerce, United States Department of, Federal executive department charged with promoting U.S. economic development and technological advancement. In Feb., 1903, the Congress established a Department of Commerce and Labor empowered to investigate and report upon the operations of corporations engaged in interstate commerce (with the

exception of common carriers). The first secretary was G. B. CORTELYOU. In 1913 the Department of Labor was established as a separate executive department, while the functions of the Department of Commerce were expanded, the chief officer of each department, the Secretary, received cabinet rank. Among its tasks are taking of censuses, promotion of American business at home and abroad, establishing standard weights and measures, and issuing patents and registering trademarks. Agencies under control of the Secretary of Commerce include the Economic Development Administration, the Bureau of the Census, the National Oceanic and Atmospheric Administration, the Office of Minority Business Enterprise, the National Bureau of Standards, the Patent Office, the Maritime Administration, and the Bureau of International Commerce.

Commerce City, city (1970 pop. 17,407), Adams co., N. central Colo., an industrial suburb of Denver, inc. 1952.

commercial law, the laws that govern business transactions, except those relating to the transportation of goods (see MARITIME LAW). Commercial law developed as a distinct body of jurisprudence with the beginning of large-scale trade. Formal documents and other evidences of regularized trade practices were known in Egypt and Babylonia. In many parts of the ancient world foreign merchants, through treaty arrangements or other agreements, were allowed to regulate their affairs and adjudicate their own disputes without interference from local authorities. They tended to settle in special sections of commercial cities where they might follow their own religions, laws, and customs. ROMAN LAW incorporated features of the already developed commercial law, which, however, was no longer handled separately in special courts but was treated simply as part of the whole legal system. The barbarian invasions of Europe caused such social disruption that it was not until late in the Middle Ages that long-range commerce again became possible in Europe and merchants were once more able to determine the rules and regulations under which they could safely operate. In the cities of N. Italy and S. France the merchant class frequently dominated the state and could enact the needed rules as legislation. In other parts of Europe associations of merchants bought protection from powerful lords or kings who granted them safe conduct and permitted them to conduct fairs and to establish regulations and methods of enforcement (see HANSEATIC LEAGUE). Both classes of merchants established special courts where summary judgment was granted with little regard for the technicalities of procedure and doctrine in the regular courts and without the use of lawyers. The term "law merchant" was applied to the substantive principles that eventually emerged from this quasi-judicial activity. The law merchant developed later in England than on the Continent, and it was not fully established there until the mid-16th cent., when English trade with the New World began to assume importance. In England the law was administered by special courts having jurisdiction only over those engaged in trade; these were the courts of piepoudre [Fr., *pied poudre*=dusty foot, an allusion to the dusty shoes of merchant judges who perhaps had been trudging the roads]. The royal courts in early days refused to hear merchants' suits, but in the 17th cent. they reversed this position and obtained exclusive jurisdiction. At first, however, the litigants were required to present proof of the law merchant in each case. The uncertainty and delay that resulted from this requirement demanded reform, and in the 18th cent. Lord Chief Justice Mansfield made the law merchant a part of the COMMON LAW and abolished the requirement of special proof. The United States adopted the principles prevailing in England in the late 18th cent. On the continent of Europe commercial law remains a separate subject matter with its special courts. It has been argued that the continental system is superior in that it distinguishes the business affairs of formally established enterprises from those entered into casually by private persons. The Anglo-American system, on the other hand, has been defended as affording no favoritism to any form of business activity. However, in commercial countries of both systems there has been a considerable increase in the extensive use of commercial arbitration that is in many ways comparable to the former private courts of merchants. The American states have adopted almost uniform commercial statutes that considerably facilitate the flow of trade throughout the nation. See F. R. Sanborn, *The Origins of Early English Maritime and Commercial Law* (1930), J. G. Pease, *The*

Law of Markets and Fairs (1958), F. A. Whitney, *The Law of Modern Commercial Practices* (1959).

commercial paper, type of short-term negotiable instrument, usually an unsecured promissory note, that calls for the payment of money at a specified date. Because it is not backed by collateral, commercial paper is usually issued by major firms whose credit-rating is so good that their notes are immediately accepted for trading. The notes are sold at a discount and mature in from three to six months. Commercial paper is an important source of cash for the issuing firm, it supplements bank loans and is usually payable at a lower rate of interest than the prime discount rate. Strictly speaking, it includes only those instruments that are used in commerce in place of money, as distinguished from paper used in investment, personal, estate, speculative, and public transactions. In addition to promissory notes, commercial paper may include drafts, bills of exchange and checks, acceptances, bills of lading, warehouse receipts, orders for delivery of goods, and express orders. See A. O. Greef, *The Commercial Paper House in the United States* (1939), N. D. Baxter, *The Commercial Paper Market* (1969).

commercial revolution, in European history, a fundamental change in the quantity and scope of commerce. In the later Middle Ages steady economic expansion had seen the rise of towns and the advent of private banking, a money economy, and trading organizations such as the HANSEATIC LEAGUE. Under the new national monarchies, most notably those of Portugal, Spain, the Netherlands, and England, markets grew wider and more secure. Commercial expansion was supported by technical improvements in seafaring, and from about 1450 explorations were made, first to Africa, then to the Orient and the New World. By the mid-16th cent. the Oriental carrying trade had been wrested from the Arabs, and Eastern goods poured into Europe. From the New World came gold and silver, which in less than a century more than doubled European prices and greatly stimulated economic activity. The focus of commerce shifted from Mediterranean to Atlantic ports, CHARTERED COMPANIES were organized, and continued improvements in navigation and ship construction speeded long voyages. As a worldwide trade evolved, the principles of MERCANTILISM were adopted, and local trade barriers were abrogated, stimulating internal commerce. Modern credit facilities also appeared, new institutions included the state bank, the bourse, and the futures market, and the promissory note and other new media of exchange were created. Quickened commercial activity brought economic specialization, thus leading to the transformations in production associated with modern capitalism. By 1700 the stage was set for the INDUSTRIAL REVOLUTION. See H. A. Miskimin, *The Economy of Early Renaissance Europe, 1300-1460* (1969), Joseph Gies, *Merchants and Money* (1972), M. M. Postan, *Medieval Trade and Finance* (1973).

commission government: see CITY GOVERNMENT.

committee, one or more persons appointed or elected to consider, report on, or take action on a particular matter. Because of the advantages of a division of labor, legislative committees of various kinds have assumed much of the work of legislatures in many nations. Standing committees are appointed in both houses of the U.S. Congress at the beginning of every session to deal with bills in the different specific classes. Important congressional committees include those on ways and means, appropriations, interstate commerce, and military, naval, and foreign affairs. The number, but not the scope, of the committees was much reduced in 1946. Since then there has been a large increase in the number of subcommittees, which have become steadily more important. Members of committees are in effect elected by caucuses of the two major parties in Congress; the majority party is given the chairmanship and majority on each committee, and chairmanships, as well as membership on important committees, are gained by seniority. The presiding officer of either house may appoint special committees, including those of investigation, which have the power to summon witnesses and compel the submission of evidence. The presiding officers also appoint committees of conference to obtain agreement between the two houses on the content of bills of the same general character. The American legislative committee system conducts most congressional business, through its powers of scrutiny and investigation of government departments. In France the constitution of the Fifth Republic permits each legislative chamber to have no more than

six standing committees. Because these committees are large, unofficial committees have formed that do much of the real work of examining bills. As in the U.S. government, these committees are quite powerful because of their ability to delay legislation. In Great Britain devices such as committees of the whole are used in the consideration of money bills and there are large standing committees of the House of Commons, but legislative committees have not traditionally been very important in the system of government. Recently attempts have been made to form specialized committees. See L. A. Froman, *The Congressional Process* (1967), George Goodwin, Jr., *The Little Legislatures* (1970), Barbara Hinkley, *The Seniority System in Congress* (1971).

Commodity Credit Corporation: see AGRICULTURAL SUBSIDIES

commodity market, organized traders' exchange in which standardized, graded products are bought and sold. Commodity markets in the United States are open for trading in about 30 commodities, ranging from wheat and cotton to silver and platinum. Most trading is done in futures contracts, i.e., agreements to deliver goods at a set time in the future for a price established at the time of the agreement. Futures trading allows both HEDGING to protect against serious losses in a declining market and speculation for gain in a rising market. For example, a seller may sign a contract agreeing to deliver grain in two months at a set price. If the grain market declines at the end of two months, the seller will still get the higher price quoted in the futures contract. If the market rises, however, speculators buying grain stand to profit by paying the lower contract price for the grain and reselling it at the higher market price. Spot contracts, a less widely used form of trading, call for immediate delivery of a specified commodity and are often used to obtain the goods necessary to fulfill a futures contract.

Commodus (Lucius Aelius Aurelius Commodus) (kôm'adas), 161-192, Roman emperor (180-192), son and successor of MARCUS AURELIUS. In 180, reversing his father's foreign policy, he concluded peace with the German and the Sarmatian tribes and returned to his licentious pleasures in Rome. There he vaunted his strength in gladiatorial combats and decreed that he should be worshipped as Hercules Romanus. He changed his own name to Marcus Commodus Antoninus and wanted to rename the city of Rome after himself. Many plots to assassinate him failed, but eventually, on the order of his advisers, he was strangled by a wrestler. PERTINAX succeeded him.

Common Cause, U.S. organization that seeks a "re-ordering of national priorities and revitalization of the public process to make our political and governmental institutions more responsive to the needs of the nation and its citizens." It was established in 1970 by John W. Gardner as the successor organization to the Urban Coalition Action Council, which was founded in 1968. Common Cause calls itself the "national citizens lobby." It supports a large number of political reforms, including abolition of the Congressional seniority system, and a limitation on national campaign spending and political contributions. It has sponsored voter registration drives throughout the nation and has worked for a liberalization of registration requirements. Common Cause has been especially effective in employing lawsuits as a weapon of political reform. In the early 1970s its legal actions were an integral part of the mostly successful drive to force disclosure of those individuals and corporations that had anonymously contributed money to the 1972 presidential campaign. Located in Washington, D.C., the group has about 110,000 members.

common-ion effect, decrease in solubility of an ionic salt, i.e., one that dissociates in solution into its ions, caused by the presence in solution of another solute that contains one of the same ions as the salt. The common-ion effect is an example of CHEMICAL EQUILIBRIUM. For example, silver chloride, AgCl, is a slightly soluble salt that in solution dissociates into the ions Ag⁺ and Cl⁻, the equilibrium state being represented by the equation $\text{AgCl}_{(s)} \rightleftharpoons \text{Ag}^+ + \text{Cl}^-$. According to LE CHÂTELIÉ'S PRINCIPLE, when a stress is placed on a system in equilibrium, the system responds by tending to reduce that stress. In the system taken as an example, if another solute containing one of those ions is added, e.g., sodium chloride, NaCl, which supplies Cl⁻ ions, the

solubility equilibrium of the solution will be shifted to remove more Cl⁻ from the solution, so that at the new equilibrium point there will be fewer Ag⁺ and Cl⁻ ions in solution and more AgCl precipitated out as a solid.

common law, system of law that prevails in England and in countries colonized by England. The name is derived from the medieval theory that the law administered by the king's courts represented the common custom of the realm, as opposed to the custom of local jurisdiction that was applied in local or manorial courts. In its early development common law was largely a product of three English courts—King's Bench, Exchequer, and the Court of Common Pleas—which competed successfully against other courts for jurisdiction and developed a distinctive body of doctrine. The term "common law" is also used to mean the traditional element in the law of any common-law jurisdiction, as opposed to its statutory law or legislation (see STATUTE), and to signify that part of the legal system that did not develop out of EQUITY, maritime law, or other special branches of practice. The distinctive feature of common law is that it represents the law of the courts as expressed in judicial decisions. The grounds for deciding cases are found in precedents provided by past decisions, as contrasted to the CIVIL LAW system, based on statutes and prescribed texts. Early common law was somewhat inflexible; it would not adjudicate a case that did not fall precisely under the purview of a particular WRIT and had an unwieldy set of procedural rules. Except for a few types of lawsuit in which the object was to recover real or personal property, the only remedy that it provided was money DAMAGES; equity was created partly to overcome these deficiencies. Until comparatively recent times there was a sharp division between common law (or legal jurisdiction) and equity (or equitable jurisdiction). In 1848 the state of New York enacted a code of civil procedure (drafted by David Dudley FIELD) that merged law and equity into one jurisdiction. Thenceforth, actions at law and suits in equity were to be administered in the same courts and under the same procedure. The Field code reforms were adopted by most states of the United States, by the Federal government, and by the United Kingdom (in the Judicature Act of 1873). Besides the system of judicial precedents, other characteristics of common law are trial by JURY and the doctrine of supremacy of the law. Originally, supremacy of the law meant that not even the king was above the law; today it means that acts of governmental agencies are subject to scrutiny in ordinary legal proceedings. Judicial precedents derive their force from the doctrine of stare decisis [Lat., =stand by the decided matter], i.e., that the previous decisions of the highest court in the jurisdiction are binding on all other courts in the jurisdiction. Changing conditions, however, soon make most decisions inapplicable except as a basis for analogy, and a court must therefore often look to the judicial experience of the rest of the English-speaking world. This gives the system flexibility, while general acceptance of certain authoritative materials provides a degree of stability. Nevertheless, in many instances, the courts have failed to keep pace with social developments and it has become necessary to enact statutes to bring about needed changes; indeed, in recent years statutes have superseded much of common law, notably in the fields of commercial, administrative, and criminal law. Typically, however, in statutory interpretation the courts have recourse to the doctrines of common law. Thus increased legislation has limited but has not ended judicial supremacy. All Canada except Quebec and all of the United States except Louisiana, Puerto Rico, and the Virgin Islands follow common law. U.S. statutes usually provide that the common law, equity, and statutes in effect in England in 1603, the first year of the reign of James I, shall be deemed part of the law of the jurisdiction. Later decisions of English courts have only persuasive authority. See O. W. Holmes, *The Common Law* (1881, new ed. by M. DeWolfe Howe, 1963, repr. 1968), T. F. Plucknett, *Concise History of the Common Law* (5th ed. 1956), Harold Potter, *Historical Introduction to English Law and Its Institutions* (4th ed. 1958), A. R. Hogue, *Origins of the Common Law* (1966), R. C. van Caenegem, *The Birth of the English Common Law* (1973).

Common Market, officially the European Economic Community (EEC), established (1957) by a treaty between Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany (Federal Republic of Germany). It is headquartered in Brussels, Belgium. In 1961, Great Britain, the Republic of Ireland,

Norway, and Denmark began negotiations for membership, but these were ended in 1963 at the insistence of France. Another attempt failed in 1967. By 1972, however, negotiations were successful and the four applicants were invited to join by signing the Treaty of Accession. Great Britain, the Republic of Ireland, and Denmark formally joined in 1973, but Norway's electorate rejected the bid. Greece and Turkey and a number of African countries are associate members. The most important step in the creation of the EUROPEAN COMMUNITY, the Common Market has as its aim the eventual economic union of its member nations, ultimately leading to political union. Steps in this program include the gradual elimination of all internal tariff barriers and establishment of a common tariff system, the free movement of labor and capital, the abolition of trusts and cartels, and the development of joint and reciprocal policies on labor, social welfare, agriculture, transport, and foreign trade. Steps toward economic union have included the following: the establishment, in 1962, of common price levels for agricultural products, the removal, 1968, of customs duties, and the agreement, in 1969, to move toward monetary union. A first step in the direction of political union was the 1970 agreement to meet twice a year for foreign policy consultations. See F. B. Jensen and Ingo Walter, *The Common Market* (1965), Uwe Kitzinger, *The European Common Market and Community* (1967), A. E. Walsh and John Paxton, *The Structure and Development of the Common Market* (1968), R. C. Mowat, *Creating the European Community* (1973), Charles Ransom, *The European Community and Eastern Europe* (1973).

Commons, John Rogers, 1862-1945, American economist, b. Hollansburg, Ohio, grad. Oberlin, 1888. Influenced by the other social sciences, Commons tried to broaden the scope of economics, especially in his noted *Legal Foundations of Capitalism* (1924) and *Institutional Economics* (1934). He was also interested in immediate social problems, chiefly those dealing with labor, and served on many government commissions. Commons was one of the editors of *A Documentary History of American Industrial Society* (10 vol., 1910-11) and *History of Labor in the United States* (4 vol., 1919-35). See his autobiography, *Myself* (1934), biography by L. G. Harter (1962).

Commons, House of: see PARLIAMENT

Commonwealth, form of administration signifying government by the common consent of the people. To Locke and Hobbes and other 17th-century writers the term meant an organized political community similar to what is meant in the 20th cent. by the word state. Certain states of the United States are known as commonwealths (Massachusetts, Pennsylvania, Virginia, and Kentucky), and the federated states of Australia are known collectively as the Commonwealth of Australia. In the same collective sense, the now independent components of the former British Empire and Britain's remaining dependencies are described as the COMMONWEALTH OF NATIONS. The Commonwealth in English history was the government set up by the victorious army power following the English civil war and the execution (1649) of King Charles I. The Commonwealth was dominated from the outset by Oliver CROMWELL, who by the Instrument of Government (1653) was made lord protector of the Commonwealth. The subsequent government is usually known as the PROTECTORATE, though the Commonwealth formally continued until Restoration in 1660.

Commonwealth Fund, foundation established (1918) by Mrs. Stephen V. Harkness "for the welfare of mankind." Its headquarters are in New York City. In 1970 its assets were estimated at over \$113 million. Contributing in its first 20 years to the early development of child guidance clinics and the strengthening of rural hospitals and health departments, the fund later emphasized the broadening and integration of medical education, experimental health services, and medical research. Fellowships are offered to graduate students and civil servants from the British Commonwealth for study in the United States, and fellowships for advanced training in medicine and allied fields are given to aid teaching and research.

Commonwealth games, series of amateur athletic meets held among citizens of countries in the Commonwealth of Nations. Originated (1930) as the British Empire games, the series is held every four years and is patterned after the Olympic games. The meets have been 1930, Hamilton, Canada, 1934, London, 1938, Sydney, Australia, (no games in 1942 and 1946 due to World War II), 1950, Auckland, New

Zealand, 1954, Vancouver, Canada, 1958, Cardiff, Wales, 1962, Perth, Australia, 1966, Kingston, Jamaica, 1970, Edinburgh, Scotland, 1974, Christchurch, New Zealand. Competition is in badminton, boxing, cycling, fencing, shooting, swimming, track and field, weight lifting, and wrestling.

Commonwealth of Australia: see AUSTRALIA

Commonwealth of Nations, voluntary association of Great Britain and its dependencies, certain former British dependencies that are now sovereign states and their dependencies, and the associated states (states with full internal government but whose external relations are governed by Britain). At its foundation under the Statute of Westminster (see WESTMINSTER, STATUTES OF) in 1931, the Commonwealth was composed of Great Britain, the Irish Free State (now the Republic of Ireland), Canada, Newfoundland (since 1949 part of Canada), Australia, New Zealand, and South Africa. As of 1974 the other sovereign members (with date of entry) were India (1947), Sri Lanka (as Ceylon, 1948), Ghana (1957), Malaysia (as Federation of Malaya, 1957), Nigeria (1960), Cyprus (1961), Sierra Leone (1961), Tanzania (as Tanganyika, 1961), Jamaica (1962), Trinidad and Tobago (1962), Uganda (1962), Kenya (1963), Malawi (1964), Zambia (1964), Malta (1964), The Gambia (1965), Singapore (1965), Guyana (1966), Botswana (1966), Lesotho (1966), Barbados (1966), Mauritius (1968), Swaziland (1968), Western Samoa (1970), Tonga (1970), Fiji (1970), Bangladesh (1972), the Bahamas (1973), and Grenada (1974). Ireland, South Africa, and Pakistan withdrew in 1949, 1961, and 1972, respectively. Nauru became a special member in 1968. The associated states in 1974 were Antigua (1967), St. Kitts-Nevis (1967), Dominica (1967), St. Lucia (1967), and St. Vincent (1969). Brunei and (nominally) Rhodesia have statutes similar to those of associated states. The purpose of the Commonwealth is consultation and cooperation. The sovereign members retain full authority in all domestic and foreign affairs, although Britain generally enjoys a traditional position of leadership in certain matters of mutual interest. Members (Canada is the sole exception) are part of the sterling monetary exchange area. There are other economic ties in the fields of trade, investment, and development programs for new nations. A set of trade agreements (begun at the Ottawa Conference in 1932) between Britain and the other members gives preferential tariff treatment to many raw materials and manufactured goods that the Commonwealth nations sell in Britain. There is great concern that Britain's entry (1973) into the European COMMON MARKET may disrupt these economic ties and threaten the viability of the Commonwealth. Periodically there are meetings of Commonwealth heads of government, but no collective decision made at these meetings is considered binding. In 1965 a Commonwealth Secretariat was set up, with headquarters in London. See BRITISH EMPIRE. See W. B. Hamilton, ed., *A Decade of the Commonwealth, 1955-1964* (1965), J. D. B. Miller, *The Commonwealth in the World* (3d ed. 1965), Zelman Cowen, *The British Commonwealth of Nations in a Changing World* (1965), *The Commonwealth Office Yearbook* (annual, from 1967), Nicholas Mansergh, *The Commonwealth Experience* (1969).

commune, in agriculture see COLLECTIVE FARM

commune (kôm'yoon), in medieval history, collective institution that developed in continental Europe after the fall of the Roman Empire. Because of the importance of the commune in municipal government, the term is also used to denote a town itself to which a charter of liberties was granted by the sovereign or feudal overlord. Although in most cases the development of communes was inextricably connected with that of the cities, there were rural communes, notably in France and England, that were formed to protect the common interests of villagers. To build defenses, regulate and improve trade, raise taxes, and maintain order, organization of an urban area was necessary. The earliest attempts at united action of the burghers involved the forming of associations in which the burghers swore an oath binding themselves together in a personal bond of mutual support and defense. The communes grew in power and, as autonomous corporate entities, became extremely influential in organizing city government. By the late 12th cent., when cities were well established, all who chose to live in them had to take an oath acknowledging the authority of the communes. Because the town was located on land belonging to a king or emperor (see FEUDALISM), the town owed allegiance to its lord and paid him tribute and, in wartime, service or money payment. Suzerains often favored the communes as

sources of wealth and confirmed their rights in liberal charters. Disputes, nevertheless, frequently arose between communes and their overlords. In the struggle between kings and nobles, the kings usually strengthened the communes and sought alliances with them. However, in the 16th and 17th cent., when European states (notably France and Spain) became centralized, the privileges of the communes were gradually withdrawn. The extent of their liberties and the details of their organization varied widely. A common feature was the elected council. The magistrates were usually called *consoli*, *podestas*, and *capitols* in Italy and S. France, *échevins* and *jurés* in N. France and the Low Countries, *Senatoren* and *Ratsherren* in Germany. Corporations and guilds gained a prominent share in the government. Militia insured the defense. The earliest communes arose in N. and central Italy. In the struggle between emperors and popes, the communes forming the LOMBARD LEAGUE gained a great deal of independence and became almost synonymous with the cities themselves. In the 14th cent., however, the communes were usurped by local tyrants. The commune of ROME was established by Arnold of Brescia in 1144. In the Low Countries, e.g., in FLANDERS, communes arose very early and enjoyed very wide privileges. In S. France, AVIGNON, ARLES, and TOULOUSE were outstanding examples of self-governed communes, as BARCELONA was in Spain. In Germany, cities such as FRANKFURT, COLOGNE, NUREMBERG, AUGSBURG, and LUBECK became republics immediately subject to the emperor (imperial and free imperial cities). Others, such as MAGDEBURG, held charters that became models for numerous towns in N. Germany, Bohemia, and Moravia. See W. F. T. Butler, *The Lombard Communes* (1906, repr. 1969), Henri Pirenne, *Medieval Cities* (tr. 1925, repr. 1969), M. V. Clarke, *The Medieval City State* (1926, repr. 1966), J. H. Mundy and Peter Riesenberger, *The Medieval Town* (1959).

Commune of Paris, insurrectionary governments in Paris formed during (1792) the FRENCH REVOLUTION and at the end (1871) of the FRANCO-PRUSSIAN WAR. In the French Revolution, the commune represented the will of the urban workers and small tradesmen against that of the upper bourgeoisie and the agrarian provinces. The commune virtually engineered the storming of the Tuileries and the arrest of the king on Aug. 10, 1792, thus precipitating the downfall of the French monarchy. For the next two years the commune, led by Pierre CHAUMETTE and Jacques HÉBERT, was, along with the Committee of Public Safety, a major power in the French state. Through the bloc of deputies known as the MOUNTAIN the commune also dominated the National Convention. During the REIGN OF TERROR, however, many leaders of the commune were executed (1794), and when the moderates gained control of the Convention (1794-95), they broke the commune's power. At the end of the Franco-Prussian War, in 1871, the Parisians opposed the national government, headed by Adolphe THIERS and the National Assembly at Versailles, as too conservative and too ready to accept a humiliating peace with Prussia. Thiers, after failing to disarm the Parisian national guard, fled (March, 1871) to Versailles, and the Parisians elected a municipal council, the commune of 1871. Meanwhile, the victorious Prussians affected neutrality. The Versailles troops began a siege of Paris (the second siege of the city in three months). The *communards*, whose aims included economic reforms, represented many shades of political opinion—followers of Louis BLANQUI, of Pierre PROUDHON, and of the Marxist First International as well as radical republicans of the 1793 Jacobin tradition, such as Louis DELESCLUZE. As the long siege drew to an end, the Versailles troops entered the city despite the desperate defense of the *communards*, who threw up barricades, shot hostages (including the archbishop of Paris), and burned the Tuileries palace, the city hall, and the palace of justice. On May 28 the commune was finally defeated. Severe reprisals followed, with more than 17,000 people executed, including women and children. Numerous persons were deported or imprisoned. Communes were also formed and suppressed in other cities in 1871, notably in Saint-Étienne, Le Creusot, Marseilles, and Toulouse. Memories of the bloody Paris repression embittered political relations between liberals and conservatives for many years afterward. See studies by E. S. Mason (1930, repr. 1967), Frank Jellinek (1937, repr. 1965), Alistair Horne (1965 and 1971), and Stewart Edwards (1971).

communicable diseases, illnesses caused by microorganisms and transmitted from an infected person or animal to another person or animal. Some

diseases are passed on by direct or indirect contact with infected persons or with their excretions. Most diseases are spread through contact or close proximity because the causative bacteria or viruses are airborne, i.e., they can be expelled from the nose and mouth of the infected person and inhaled by anyone in his vicinity. Such diseases include diphtheria, scarlet fever, measles, mumps, whooping cough, influenza, and smallpox. Some infectious diseases can be spread only indirectly, usually through contaminated food or water, e.g., typhoid, cholera, dysentery. Still other infections are introduced into the body by animal or insect carriers, e.g., rabies, malaria, encephalitis, Rocky Mountain spotted fever. The human disease carrier, i.e., the healthy person who may himself be immune to the organisms he harbors, is also a source of transmission. Some infective organisms require rather special circumstances for their transmission, e.g., sexual contact in syphilis and gonorrhea, injury in the presence of infected soil or dirt in tetanus, infected transfusion blood or instruments in serum hepatitis and sometimes in malaria. A disease such as tuberculosis may be transmitted in several ways—by contact (human or animal), through food or eating utensils, and by the air. Control of communicable disease depends upon recognition of the many ways transmission takes place. It must include isolation or even quarantine of persons with certain diseases. Proper antiseptics (see ANTISEPTIC) should be observed in illness and in health. Immunologic measures (see IMMUNITY) should be utilized fully. Education of the population in rules of public health is of great importance both in the matter of personal responsibility (disposal of secretions, proper handling and preparation of food, personal hygiene) and community responsibility (safe water and food supply, garbage and waste disposal). Animal and insect carriers must be controlled, and the activities of human carriers must be limited.

communication, transfer of information, such as thoughts and messages, as contrasted with transportation, the transfer of goods and persons (see INFORMATION THEORY). The basic forms of communication are by signs (sight) and by sounds (hearing, see LANGUAGE). The reduction of communication to writing was a fundamental step in the evolution of society for, in addition to being useful in situations where speech is not possible, writing permits the preservation of communications, or records, from the past. It marks the beginning of recorded history. Whereas the rise of BOOK PUBLISHING and JOURNALISM (see also NEWSPAPER and PERIODICAL) facilitated the widespread dissemination of information, the invention of the TELEGRAPH, the RADIO, the TELEPHONE, and TELEVISION made possible instantaneous communication over long distances. With the installation of the submarine CABLE and improvements in short-wave radio technology, international communication was greatly improved and expanded. In 1962 several types of communications satellites were launched. Three years later, in 1965, Early Bird, or Intelsat I, the first in a series of advanced communications satellites, was launched (see SATELLITE, ARTIFICIAL). The 20th-cent. development of mass media has played a major role in changing social, economic, political, and educational institutions. In the United States, radio and television communication is controlled by the FEDERAL COMMUNICATIONS COMMISSION. The international phases of transport and communications are under the direction of the Office of Transport and Communications of the Dept. of State. The UN maintains its International Telecommunication Union (ITU), which has three functions—to maintain and extend international cooperation for the improvement and rational use of telecommunication, to promote the development and efficient use of technical facilities, and to harmonize the actions of nations. Telecommunication has been defined by international agreement as any emission, transmission, or reception of signs, signals, sounds, and writing. See BROADCASTING. See Colin Cherry, *On Human Communication* (1962), T. H. Crowley and others, *Modern Communications* (1962), H. M. McLuhan, *The Medium is the Message* (1967), B. H. Bagdikian, *The Information Machines* (1971), Hadley Read, *Communication Methods for all Media* (1972), John Tebbel, *The Media in America* (1974).

communications satellite, artificial SATELLITE that functions as part of a global radio-communications network. Echo, the first communications satellite, was launched in Aug., 1960. It was an uninflated inflatable sphere that passively reflected radio signals back to earth. Later satellites carried with them electronic devices for receiving, amplifying,

and rebroadcasting signals to earth. Relay, launched by the National Aeronautics and Space Administration (NASA), was the basis for Telstar, a commercially sponsored experimental satellite. Earth-synchronous orbits were used by NASA's Syncom and its Earlybird, the world's first commercial communications satellite. Such satellites orbit with a period of 24 hr, so that they remain over a single spot on the earth's surface. In 1962, the U.S. Congress passed the Communications Satellite Act, which created the COMMUNICATIONS SATELLITE CORP. (COMSAT). COMSAT participated in an international consortium, which launched four series of Intelsat satellites, beginning with Earlybird in 1965.

Communications Satellite Corporation (COMSAT), organization incorporated (1962) by an act of Congress to establish a commercial system of international communications using artificial satellites. Although government sponsored, it was financed by a public stock issue. The launching in 1965 of its first satellite, Early Bird, inaugurated a trans-Atlantic service, a similar link with Asia was established some 18 months later. Along with representatives of more than 80 other nations, COMSAT is a member of the International Telecommunications Satellite Consortium (INTELSAT). Through member-company satellites and its many earth stations around the world, the consortium provides for international communications via telephone and television. See COMMUNICATIONS SATELLITE.

communio, see EUCHARIST, LORD'S SUPPER

communism, fundamentally, the system of social organization in which property (especially real property and the means of production) is held in common. Thus, the *ejido* system of the Mexican Indians and the property-and-work system of the INCA were both communist, although the former was a matter of more or less independent communities cultivating their own lands in common and the latter a type of community organization within a highly organized empire. In modern usage, the term Communism (written with a capital C) is applied to the movement that aims to overthrow the capitalist order by revolutionary means and to establish a classless society in which all goods will be socially owned. The theories of the movement come from Karl MARX, as modified by Vladimir Ilyich LENIN, leader of the successful Communist revolution in Russia. Communism, in this sense, is to be distinguished from socialism, which (as the term is commonly understood) seeks similar ends but by evolution rather than revolution.

Origins of Communism Communism as a theory of government and social reform may be said, in a limited sense, to have begun with the ancient Greek idea of the Golden Age, a concept of a world of communal bliss and harmony without the institution of private property. Plato, in his *Republic*, outlined a society with communal holding of property, his concept of a hierarchical social system including slavery has by some been called "aristocratic communism." The Neoplatonists revived the idea of common property, which was also strong in some religious groups such as the Jewish ESSENEs and certain early Christian communities. These opponents of private property held that property holding was evil and irreligious and that God had created the world for the use of all mankind. The first of these ideas was particularly strong among Manichaean and Gnostic heretics, such as the Cathari, but these concepts were also found in some orthodox Christian groups (e.g., the Franciscans). The MANORIAL SYSTEM of the Middle Ages included common cultivation of the fields and communal use of the village commons, which might be vigorously defended against the lord. It was partly to uphold these common rights, threatened by early agrarian capitalism, that the participants in the Peasants' Revolt (1381) in England and the insurgents of the Peasants' War in 16th-century Germany advocated common ownership of land and of the means of production. In the 16th and 17th cent. such intellectual works as Sir Thomas More's *Utopia* proposed forms of communal property ownership in reaction to what the authors felt was the selfishness and depredation of growing economic individualism. In addition, some religious groups of the early modern period advocated forms of communism, just as had certain of the early Christians. The Anabaptists under Thomas MUNCER were the real upholders of communism in the Peasants' War, and they were savagely punished for their beliefs. This same mixture of religious enthusiasm and economic reform was shown in 17th-century England by the tiny sect of the DIGGERS, who actually sought to put their theories into practice on common land. Capitalism, reinforced by the INDUS-

TRIAL REVOLUTION, which began in the 18th cent., brought about the conditions that gave rise to modern communism. Wages, hours, and factory conditions for the new industrial class were appalling, and protest grew. Although the French Revolution ended without satisfying radical demands for economic egalitarianism, the voice of François BABEUF was strongly raised against economic inequality and the power of private property. For his class consciousness and his will to revolution he has been considered the first modern communist. Although he was guillotined, his movement (Babouvism) lived on, and the organization of his secret revolutionary society on the "cell" system was to be developed later as a means of militant revolution. In the early 19th cent. ardent opponents of industrial society created a wide variety of protest theories. Already what is generally known as utopian communism had been well launched by the comte de SAINT-SIMON. In this era a number of advocates gathered followers, founded small cults, and attempted to launch COMMUNISTIC SETTLEMENTS, particularly in the United States. Most notable among such men were Robert OWEN, Étienne CABET, and Charles FOURIER. Pierre Joseph PROUDHON, although he did not adopt the principle of common ownership, exercised great influence by his attacks on the evils of private property. A host of critics and idealistic revolutionists arose in Germany. More important was the survival or revival of Babouvism in secret French and Italian revolutionary societies, intent on overthrowing the established governments and on setting up a new, propertyless society. It was among them that the terms *communism* and *socialism* were first used. They were used vaguely and more or less interchangeably, although there was a tendency to use the term *socialist* to denote those who merely stressed a strong state as the owner of all means of production, and the term *communist* for those who stressed the abolition of all private property (except immediate personal goods). Among the chief leaders of such revolutionary groups were the Frenchmen Louis BLANC and (far more radical) Louis Auguste BLANQUI, both of whom played important roles in the February Revolution of 1848. The year 1848 was also marked by the appearance of *The Communist Manifesto* of Karl Marx and Friedrich ENGELS, the primary exposition of the socioeconomic doctrine that came to be known as MARXISM. It postulated the inevitability of a communist society, which would result when economic forces (the determinants of history) caused the class war, in this struggle the exploited industrial proletariat would overthrow the capitalists and establish the new classless order of social ownership. Marxian theories and programs soon came to dominate left-wing thought. Although the German group (founded in 1847) for which *The Communist Manifesto* was written was called the Communist League, the Marxist movement went forward under the name of SOCIALISM, its 19th-century history is treated in the article under that heading and under SOCIALIST PARTIES, in European history.

The Growth of Modern Communism The modern form of Communism (written with a capital C) began to develop with the split (1903) within the Russian Social Democratic Labor party into factions of BOLSHEVISM and MENSHEVISM. The more radical wing, the Bolsheviks, were led by Lenin and advocated immediate and violent revolution to bring about the downfall of capitalism and the establishment of an international socialist state. The triumph of the Bolsheviks in the RUSSIAN REVOLUTION of 1917 gave them the leadership in socialist action. They constituted the Communist party in 1918 (see COMMUNIST PARTY, in the USSR). Meanwhile World War I had shaken the socialist movement as a whole by splitting those who cooperated with the governments in waging the war from those who maintained a stand for revolution against all capitalist governments. Chief among the stalwart revolutionists were the Communist party in Russia and the SPARTACUS PARTY (later the Communist party) in Germany. The establishment of a working socialist state in Russia tended to give that country leadership, and Leninism grew stronger. Communist revolts immediately after the war failed in Germany, and the briefly successful Communist state under Béla KUN in Hungary was also repressed with great bloodshed. The revolutionary socialists now broke completely with the moderate majority of the movement. They withdrew from the Second INTERNATIONAL and formed (1919) the Third INTERNATIONAL, or COMINTERN, in 1919. Henceforth, the term *Communism* was applied to the ideology of the parties founded under the aegis of the Comintern. Their program called for the unit-

ing of all the workers of the world for the coming world revolution, which would be followed by the establishment of a dictatorship of the proletariat and state socialism. Ultimately there would develop a harmonious classless society, and the state would wither away. The Communist parties were organized on a hierarchical basis, with active cells of members as the broad base, they were made up only of the elite—those approved by the higher members of the party as being reliable, active, and subject completely to party rule. Communist parties were formed in countries throughout the world and were particularly active in trying to win control of labor unions and in fomenting labor unrest. Despite the existence of the Comintern, however, the Communist party in the USSR adopted, under Joseph STALIN, the theory of "socialism in one country," which asserted the possibility of building a true Communist system in one country alone. This departure from Marxist internationalism was challenged by Leon TROTSKY, whose theory of "permanent revolution" stressed the necessity of world revolution. After Trotsky was expelled (1929) from the Soviet Union, he founded a Fourth, or Trotskyist, International to rival the Comintern. Stalin's program of building the Soviet Union as the model and base of Communism in the world had the effect of tying Communist and Soviet policy even more closely together, an effect intensified by the "monolithic unity" produced by the party purges of the 1930s. It became clearly evident in that decade that in practice Communism, contrary to the hopes of theorists and intellectuals, had created in the USSR a giant totalitarian state that dominated every aspect of life and denied the ideal of individual liberty. Except for the small Mongolian People's Republic, no other Communist state was created before World War II. The Chinese Communist party was founded in 1921 and began a long struggle for power with the KUOMINTANG. However, it received little aid from the USSR, and it was not to achieve its goal until 1949. In the late 1920s and early 30s the Communist parties followed a policy of total hostility to the socialists, and in Germany this was one factor that facilitated the rise of the Nazis. In 1935, however, the Comintern dictated a change in policy, and the Communists began to work with other leftist and liberal parties for liberal legislation and government, as in the Popular Front government in France. In World War II the USSR became an ally of the Western capitalist nations after Germany attacked it in 1941. As part of its cooperation with the Allies the USSR brought about (1943) the dissolution of the Comintern. Hopes for continued cooperation, intrinsic in the formation of the United Nations, were dashed, however, by a widening rift between the Soviet bloc and the Western democracies, especially the United States, after the war (see COLD WAR). Communism had been vastly strengthened by the winning of many new nations into the zone of Soviet influence and strength in Eastern Europe. Governments strictly modeled on the Soviet Communist plan were installed in the "satellite" states—Albania, Poland, Czechoslovakia, Hungary, Bulgaria, and East Germany. A Communist government was also created under Marshal TITO in Yugoslavia, but Tito's independent policies led to the expulsion of Yugoslavia from the COMINFORM, which had replaced the Comintern, and Titoism was labeled deviationism. By 1950 the Chinese Communists held all of China except Taiwan, thus controlling the most populous nation in the world. A Communist administration was also installed in North Korea, and fighting between the People's Republic of Korea (Communist) and the southern Republic of Korea exploded in the KOREAN WAR (1950-53), fought between Communist and United Nations troops. Other areas where rising Communist strength provoked dissension and in some cases actual fighting include Malaya, Laos, many nations of the Middle East and Africa, and, especially, Vietnam, where the United States intervened to aid the South Vietnamese regime against Communist guerrillas and North Vietnam (see VIETNAM WAR). In many of these poor countries, Communists attempted, with varying degrees of success, to unite with nationalist and socialist forces against Western imperialism. After the death of Stalin in 1953 some relaxation of Soviet Communist strictures seemed to occur, and at the 20th party congress (1956) Premier Nikita Khrushchev denounced the methods of Stalin and called for a return to the principles of Lenin, thus presaging some change in Communist methods, although none in fundamental ideology. A resurgence of nationalist feeling within the Soviet bloc—vividly demonstrated by the bloodily suppressed Hungar-

ian uprising of 1956—ultimately forced some acknowledgment from the USSR. However, while it began to allow some limited freedom of action to the Eastern European countries, the invasion of Czechoslovakia in 1968 demonstrated its determination to prevent serious challenges to its domination. Communist parties in Western countries, on the other hand, especially in Italy, have felt more free to set their own policy. When in 1961 the USSR attacked Albania for Stalinism, China came strongly to Albania's defense. Ideological differences between China and the USSR became increasingly apparent in the 1960s and 70s, with China portraying itself as a leader of the underdeveloped world against the two superpowers, the United States and the Soviet Union. While both the USSR and China sought better relations with the United States in the 1970s, it appeared that the differences between the two major Communist powers would increase rather than decrease. See N. A. Berdyaev, *The Origin of Russian Communism* (tr 1937, repr 1960), Max Beer, *The General History of Socialism and Social Struggles* (2 vol., tr 1957), Donald Zagoria, *The Sino-Soviet Conflict* (1962, repr 1964), Z. K. Brzezinski, *Ideology and Power in Soviet Politics* (rev ed 1967), F. W. Houn, *A Short History of Chinese Communism* (1967), G. F. Hudson, *Fifty Years of Communism: Theory and Practice, 1917-1967* (1968), Helmut Gruber, *International Communism in the Era of Lenin* (1969), Raya Dunajevskaya, *Marxism and Freedom* (3d ed 1971), Leonard Shapiro, *The Communist Party of the Soviet Union* (2d ed 1971), R. C. Goldston, *Communism: A Narrative History* (1972), W. S. Sworakowski, *World Communism: A Handbook* (1973), D. A. Hyde, *Communism Today* (1973).

communistic settlements, communities practicing common ownership of goods. Communistic settlements were known in ancient and medieval times, but the flowering of such groups occurred in the 19th cent. in the United States, where a number of German pietistic sects established such communities as the AMANA CHURCH SOCIETY, Iowa, Harmony, Pa. (see HARMONY SOCIETY), and ZOAR, Ohio. Similar settlements were founded by the Shakers, Mormons, Mennonites, Dukhobors, and Jansenites. Unique religious settlements were the Oneida Community (see under ONEIDA, N.Y.), Hopedale, Mass., and the Brotherhood of the New Life, N.Y. (see HARRIS THOMAS LAKE). Another group were non-Christian, often antireligious and utopian. The leading communities within this group were of two types, those founded by the followers of Robert OWEN (including NEW HARMONY, Ind., and NASHOBA, Tenn.) and the numerous ones (notably BROOK FARM, Mass.) formed on the principles of Charles FOURIER. Belonging to neither of these groups were the Icarian settlements, led by Etienne CABET, and the anarchistic villages of Josiah WARREN. The religious groups, unified by strong faith and authority, tended to prosper and outlive the secular groups, the latter, however, often attracting brilliant and original personalities, provided a ferment of new thought. The chief attempts since the 19th cent. at setting up such colonies have been in Israel, where there are a number of successful agricultural collectives (see COLLECTIVE FARM). See A. F. Tyler, *Freedom's Ferment* (1944, repr 1962), R. M. Kanter, *Commitment and Community* (1972).

Communist party, in China. Founded in 1921 by Chen Tu-hsiu and Li Ta-chao, professors at Peking Univ., the party was under strong COMINTERN influence from its beginnings. The Chinese Communist party became formally allied with the KUOMINTANG in 1923, by 1925 Communists held many top posts in the Kuomintang organization. CHIANG KAI-SHEK forced a reduction in Communist power in March, 1926, but the party maintained the Kuomintang alliance at the insistence of the USSR. In April, 1927, Chiang Kai-shek drove the Communists, led by CHOU EN LAI, from SHANGHAI and executed many of their leaders, in July the party formally resigned from the Kuomintang government at Wuhan and went underground, and the long conflict between the party and the Kuomintang began. In Aug., 1927, MAO TSE-TUNG led the peasants of Hunan prov. in the Autumn Crop Uprising, a popular rebellion that was bloodily suppressed. One branch of the party secretly maintained itself in the cities, a short-lived Communist commune was established at Canton in Dec., 1927. In the rural hinterland Mao Tse-tung and CHU TEH established (1927) a precarious soviet in Kiangsi prov. Several other rural soviets were set up in Hunan, Anhwei, and Hupei provs. By 1931, Mao was in control of the official soviet government at Jui-chin, radical land-reform policies were followed to gain the support of the peasants. A Red Army, under

the leadership of Mao and Chu Teh, was recruited from the peasantry of Kiangsi. Eventually driven from their southern base by Chiang's military campaigns, many thousands of Communists trekked north on the LONG MARCH and set up headquarters at YEN AN in Shensi prov. There the party organization was strengthened, factories were built, and the civil war with Chiang's forces continued. In Sept., 1937, after a two-year effort to promote Chinese unity in the face of further Japanese aggression (see SINO-JAPANESE WAR, SECOND), the Communists obtained a limited truce from Chiang Kai-shek and accepted his nominal authority, although they retained actual military and political control over large areas in the northwest. The truce with the Kuomintang broke down in 1939, but Communist guerrillas remained the only really effective force against the Japanese in N. China. When World War II ended in 1945, the Communists controlled wide rural areas in N. and central China and moved quickly to gain control of Manchuria. From 1945 to 1949 party membership swelled as Communist armies took city after city from the Nationalists. After the People's Republic of China was set up in 1949, the party became the administrative and policymaking center of the government. For the changes wrought by the Communist regime in China, see CHINA. See J. E. Rue, *Mao Tse-tung in Opposition, 1927-1935* (1966), Shanti Swarup, *A Study of the Chinese Communist Movement* (1966), F. W. Houn, *A Short History of Chinese Communism* (1967), K. T. Chang, *The Rise of the Chinese Communist Party, 1921-1927* (1971).

Communist party, in the USSR, officially the Communist party of the Soviet Union. It exercises all effective power within the country, and, as the oldest and for a long time the only ruling Communist party in the world, it wields considerable (and in some cases controlling) influence over the Communist parties of other countries (see COMMUNISM). It presently has about 14,700,000 members (out of a total estimated population of 246,000,000) and more than 375,000 party units throughout the USSR. Marxist socialism (see MARXISM) took root in Russia in the 1880s. Led by Georgi PLEKHANOV, a small group of Marxists formed (1883) the League for the Emancipation of Labor, stressing the revolutionary capabilities of the growing industrial proletariat. Other groups were soon founded, the largest of which was the Jewish *Bund*, and in 1898 they united to form the Russian Social Democratic Labor party. The second party congress (1903) in Brussels and London split into factions of BOLSHEVISM and MENSHEVISM. The Bolsheviks, led by Vladimir Ilyich LENIN, demanded a highly disciplined, centralized, and dedicated revolutionary elite rather than a mass party. These principles guided the Bolsheviks before the 1917 revolution and remain the basis for the present Russian Communist party. When the RUSSIAN REVOLUTION began in March, 1917, the Bolsheviks were unprepared, and under the provisional government they played a minor role. When Lenin returned from exile in April, he called for seizure of power, despite opposition within the party. The Bolsheviks gained strength in key areas, capitalizing on mass discontent, and in November they were able to seize control. With a total party membership of about 200,000, they faced the problem of governing alone or sharing power. Lenin and Leon TROTSKY demanded party dictatorship and destroyed all opposition from Mensheviks and other socialist groups. During the civil war (1918-20) the Bolshevik party—from 1918 the All-Russian Communist party—was at the height of its revolutionary ardor. Despite seemingly impossible tasks, it strengthened the party apparatus on all levels. After the death of Lenin (1924) dissident elements in the party were silenced as Joseph STALIN emerged as Lenin's successor. In the party congresses of the 1920s debates were stormy and some intraparty democracy was still evident, but the 16th party congress in 1929 demonstrated Stalin's virtual supremacy. The party, called from 1925 the All-Union Communist party (Bolsheviks), still had at this time a strongly urban character. One purpose of the massive agricultural collectivization launched in 1929 was to strengthen the party in rural areas. By 1933 there were more than 3,500,000 party members and candidates, many newly recruited from rural areas. Then there began the series of purges that turned the 1930s into a reign of terror. The former leaders of the party—Trotsky, BUKHARIN, ZINOVIEV, KAMENEV, RYKOV, and others—were accused of treason. A series of spectacular show trials were held, almost all the defendants were executed or exiled. As the purges drew to a close by 1938, party membership had declined to 1,920,000. There was an immediate upturn in membership with the

approach of World War II, in the period after the war membership grew more slowly. In the 1960s the tendency was once more to broaden the base of membership. The Stalinist period, from 1930 until 1953, was characterized by a repressive and omnipotent dictatorship over all Soviet citizens, including party members. The party as an organization lost influence, while its leaders gained absolute power. Party congresses were infrequent. In 1952 the party was renamed the Communist party of the Soviet Union. Decisions were made by Stalin alone, and the fortunes of party members depended upon his whims. Unbounded adulation was accorded him. However, at the 20th party congress (1956, three years after Stalin's death) Premier NIKITA KHRUSHCHEV testified that the beliefs long held in the West about Stalin's crimes were true. The subsequent campaign of de-Stalinization reached a climax at the 22d party congress in 1961, and Stalin's body was removed from its place of honor in a mausoleum in Red Square. After the death of Stalin, Georgi MALENKOV at first appeared to hold power, but ultimately Khrushchev emerged as the successor, holding by 1958 the highest posts in both party and government—first secretary of the party and chairman of the council of ministers. The purge (1957-58) of the "antiparty group" of Malenkov, Vyacheslav MOLOTOV, Lazar Kaganovich, and Nikolai BULGANIN strengthened his position. Khrushchev, however, was suddenly removed in 1964 because of dissatisfaction with both his foreign and domestic policies. He was replaced by a so-called collective leadership whose leading members were Leonid BREZHNEV and Alexei KOSYGIN. By the 1970s, Brezhnev, general secretary of the party, had clearly emerged as the dominant figure but with less personal power than Khrushchev had held. The Communist party is organized so that its units parallel the territorial hierarchy of state administration as well as all institutions such as the press, education, armed forces, and agriculture. Through these institutions the party can effectively control the making and implementation of policy. A small core of party members is made up of full-time paid professional workers, the rest hold regular jobs in addition to fulfilling their party obligations. Each party committee has a small ruling body called a bureau or presidium, the leading member of which is the first secretary. The smallest party cell may consist of only three members in a factory, school, or office. The highest body, elected by the party congress, is the central committee, of which the ruling body is the presidium (formerly politburo). Membership in the party is determined in a severe selection process, involving recommendations from party members and a period of trial during which a candidate must prove his ability. A major source of new party members is the Young Communist League (Komsomol), an organization of youths from the ages of 14 to 28. It presently has over 30 million members. Komsomol is patterned after the Communist party and is strictly controlled to realize the goals of indoctrinating Soviet youth with the aims of the party, carrying out specific party tasks, and training future party members. See Herbert Marcuse, *Soviet Marxism* (1958, repr 1968), R. T. Fisher, *Pattern for Soviet Youth: A Study of the Congresses of Komsomol, 1919-1954* (1959), J. S. Reshetar, Jr., *A Concise History of the Communist Party* (rev ed 1964), Merle Fainsod, *How Russia is Ruled* (rev ed 1965), T. H. Rigby, *Communist Party Membership in the U.S.S.R., 1917-67* (1968), D. J. R. Scott, *Russian Political Institutions* (4th ed 1969), Leonard Shapiro, *The Communist Party of the Soviet Union* (2d ed 1971).

Communist party, in the United States, political party that espouses the Marxist-Leninist principles of COMMUNISM. The first Communist parties in the United States were founded in 1919 by dissident factions of the Socialist party. The larger, which called itself the Communist party of America, consisted of many of the former foreign language federations of the Socialist party, in particular the Russian Federation and the former Michigan Socialist party. The other, named the Communist Labor party, was led by Benjamin Gitlow and John REED. The parties immediately became subject to raids by agents of Attorney General A. Mitchell PALMER and local authorities. These raids resulted in a sharp drop in party membership and, in Jan., 1920, forced the Communists to go underground. In May, 1921, under strong pressure from the Third (Communist) International, or Comintern, the Communist groups in the United States were united under the name of the Communist party of America. The Comintern also forced a change in policy from a militant revo-

lutionary one to one stressing the need to work through established labor organizations and to develop a mass following. Accordingly, in Dec., 1921, the Communists organized the Workers party of America, as a legal, acknowledged organization, and by 1923 the underground party had ceased to function. Attempts were made to work through the growing farmer-labor movement of the early 1920s, but they failed in the face of opposition from most farmer-labor leaders and from the Progressive leader, Senator Robert La Follette. Unsuccessful Communist-led strikes among textile workers in Passaic, N.J. (1926), in New Bedford, Mass. (1928), and among New York City garment workers (1926) also lessened Communist influence in trade unions. During this period two factions developed within the party. One, led by Jay LOVestone, was generally socialist in background and concerned with political theory. The other, led by William Z. FOSTER and Earl BROWDER, was more syndicalist in background and interested in union activity. These two groups alternated in party leadership until 1929, when the Comintern ordered that the Foster group be placed in control to carry out the new policy line established at its Sixth World Congress (1928). The party was renamed the Communist party of the United States of America. The new period, called the Third Period, saw the development of the theory of "social fascism," by which labor and socialist leaders were denounced as more dangerous enemies of the workers than the fascists. During this period the American Communists also made a major appeal for Negro support, calling for the creation of a Negro republic in the South, on the grounds that Negroes were a national, not a racial, minority. The adoption of the new party line coincided with the beginning of the depression of 1929, and as the economic crisis grew, Communist membership increased. However, the policies of that time isolated the Communists both in politics and in the unions, so that despite increased membership and some success in organizing the unemployed, the party's influence remained small. In 1935 the Seventh World Congress of the Comintern announced another change of direction. It now stressed the need for a "popular front," a movement to create political coalitions of all anti-fascist groups. In the United States, the Communists abandoned opposition to the New Deal, they reentered the mainstream of the trade union movement and played an important part in organizing new unions for the Congress of Industrial Organizations (CIO), for the first time gaining important positions of power in the union movement. As antifascist activists they attracted the support of many non-Communists during this period. However, the party's attacks on Nazi Germany ended abruptly with the signing of the Hitler-Stalin nonaggression pact in Aug., 1939, and World War II, which immediately followed, was denounced as an "imperialist" war caused by Great Britain and France. American defense preparations and aid to the Western democracies were vigorously opposed as "war-mongering," and Communist-dominated unions were quick to go out on strike. In June, 1941, when Germany attacked Russia, the character of the war, for the Communists, was changed overnight from "imperialist" to "democratic." The party, under the leadership of Earl Browder, now went all out in its support of the war. Strikes were opposed as a hindrance to the war effort, and in 1944 the U.S. Communist party "disbanded" as a political party to become the Communist Political Association. In 1945, however, Browder's policy was attacked as being one of the "right deviationism," and he was replaced by William Z. Foster. This change in line and the beginning of the COLD WAR brought the party, which had achieved relative respectability during the war, under renewed attack. In 1948 the Communists supported the presidential candidacy of Henry A. Wallace on the PROGRESSIVE PARTY ticket, but he obtained only slightly more than a million votes. Communist influence in labor unions came under increasing attack. The Taft-Hartley Act of 1947 denied the facilities of the National Labor Relations Board to unions that failed to file affidavits avowing that their officers were not Communists, and in 1949-50 the CIO expelled unions that were still Communist-dominated. In March, 1947, President Truman barred Communists or those aiding or sympathetic to Communism from employment in the executive branch of the Federal government. The sensational confessions of former Communists, such as Whittaker CHAMBERS, and increasing evidence of Communist espionage led to highly publicized investigations by Congress (especially by the House Un-American Activities

Committee and the Senate Subcommittee on Government Operations), the Federal Bureau of Investigation, and Federal grand juries. In Oct., 1949, 11 top Communist leaders were convicted on charges of conspiring to advocate the overthrow of the U.S. government. In June, 1951, the Supreme Court found the Smith Act of 1940, under which the convictions had been obtained, constitutional, and the government proceeded to bring many lesser Communist officials to trial. In 1950 the McCarran Internal Security Act required that all Communist and Communist-dominated organizations register with the Federal government the names of all members and contributors, and the Communist Control Act of 1954 further strengthened the provisions of the McCarran Act by providing severe penalties for Communists who failed to register, denying collective bargaining power to Communist-dominated unions, and taking away the "rights, privileges and immunities" of the Communist party as a legal organization. At the same time many states passed "little Smith Acts," with such provisions as the requirement of loyalty oaths from state employees and the denial of a place on the ballot to Communist parties. This was also the period of Senator Joseph McCarthy's hysterical search for Communists in all branches of government. In 1956, Nikita Khrushchev's denunciation of Stalin's excesses, along with the Russian suppression of the Hungarian revolt in that same year, created new schisms in the U.S. Communist party, which lost thousands of members. The Supreme Court has upheld many of the provisions of the Smith and McCarran acts as they apply to the leadership of the Communist party, but several decisions of the 1960s substantially voided sanctions against the rank and file except where some active conspiracy against U.S. security is proved. As a result the party resumed open activities in 1966 and ran presidential candidates in the elections of 1968 and 1972. In 1972 it claimed about 17,000 dues-paying members. The material on American Communism is voluminous and is listed in three bibliographies: Fund for the Republic, Inc., *Bibliography on the Communist Problem in the United States* (1955), Robert F. Delaney, *The Literature of Communism in America* (1962), and Joel Seidman, ed., *Communism in the United States* (1969). For two works registering official views of the American Communist party in different periods, see Earl R. Browder, *What is Communism?* (1936) and William Z. Foster, *History of the Communist Party of the United States* (1952, repr. 1968). See James O'Neal and G. A. Werner, *American Communism: A Critical Analysis of Its Origins, Development and Programs* (1947, rev. ed. 1972), Irving Howe and Lewis Coser, *The American Communist Party, A Critical History* (1958, repr. 1962), Theodore Draper, *American Communism and Soviet Russia* (1960), Joseph Starobin, *American Communism in Crisis, 1943-1957* (1972).

community chest, cooperative organization of citizens and social welfare agencies in a city. Also known as a united fund, it has two purposes, to raise funds through an annual campaign for its member agencies and to budget the funds raised. The fund is administered by the community chest or united fund itself, or as a joint endeavor with a community welfare council, to represent the idea of administering, as well as collecting, the funds, the national association in 1927 took the name Community Chests and Councils. Today the organization's official name is the United Way of America. The idea of cooperative collecting for charitable purposes originated in Liverpool, England (1873), and, in the United States, in Denver (1887). In 1900 the Cleveland chamber of commerce went a step further and assumed responsibility for endorsing the agencies seeking funds, 13 years later Cleveland brought almost all its welfare organizations together in the Cleveland Welfare Council. The name *community chest* was coined in Rochester, N.Y., in 1913. See J. R. Sealey et al., *Community Chest: A Case Study in Philanthropy* (1957).

community college, public institution of higher education. Community colleges are characterized by a two-year curriculum that leads to either the associate degree or transfer to a four-year college. The transfer program parallels the first two years of a four-year college. The degree program generally prepares students for direct entrance into an occupation. Because of their low tuition, local setting, and relatively easy entrance requirements, community colleges have been a major force in the post-World War II expansion of educational opportunities in the United States. Their privately owned counterparts are known as junior colleges. See Edmund J. Gleazer, Jr., *This is the Community College*

(1968), C. R. Monroe, *Profile of the Community College* (1972).

commutation of sentence, in criminal law, reduction of a sentence for a criminal act by action of the executive head of the government. Like PARDON, commutation of sentence is a matter of grace, not of right, it is distinguished from pardon, however, in that the conviction of crime is not nullified. The commutation, hence, may be granted on condition that the criminal observe certain restrictions for the balance of his original sentence. Many states have statutes providing for commutation of sentence as a reward for good conduct during imprisonment. Once earned, the commutation becomes a matter of right and may be enforced by court action.

commutative law, in mathematics, law holding that for a given binary operation (combining two quantities) the order of the quantities is arbitrary, e.g., in addition, the numbers 2 and 5 can be combined as $2+5=7$ or as $5+2=7$. More generally, in addition, for any two numbers a and b the commutative law is expressed as $a+b=b+a$. Multiplication of numbers is also commutative, i.e., $a \times b = b \times a$. In general, any binary operation, symbolized by \circ , joining mathematical entities A and B obeys the commutative law if $A \circ B = B \circ A$ for all possible choices of A and B . Not all operations are commutative, e.g., subtraction is not since $2-5 \neq 5-2$, and division is not since $\frac{2}{5} \neq \frac{5}{2}$.

commutator, device used in an electric GENERATOR to convert the alternating current produced in the generator into direct current before the current is sent into an external circuit, it is basically a rotary switching device synchronized with the frequency of the alternating current. Commutators are also used in electric MOTORS to switch currents in order to maintain magnetic polarities necessary to keep the shafts of the motors turning.

Commynes, Philippe de: see COMINES, PHILIPPE DE.
Comnenus (kōmnē'nās), family name of several Byzantine emperors—ISAAC I, ALEXIUS I, JOHN II, MANUEL I, ALEXIUS II, and ANDRONICUS I—who reigned in the 11th and 12th cent., and of the historian, Princess ANNA COMNENA. Though unable to turn back the forces that contributed to the eventual downfall of the BYZANTINE EMPIRE, they were generally able rulers. Hellenism was revived during the family's reign, and contact with the West was increased. A branch of the family founded the empire of Trebizond (see TREBIZOND, EMPIRE OF) after the fall of Constantinople in 1204.

Como (kō'mō), city (1971 pop. 97,395), capital of Como prov., Lombardy, N. Italy, at the southwest end of Lake Como, near the Swiss border. It is primarily a tourist center. Originally a Roman colony, Como became an independent commune in the 11th cent. and was frequently at war with, and ruled by, Milan. It later came under Spanish and Austrian control and was liberated by Garibaldi in 1859. In the Middle Ages and the Renaissance, craftsmen, architects, and sculptors from Como (the *maestri comacini*) were renowned throughout Italy. The city has a remarkable marble cathedral (14th-18th cent.), a 13th-century city hall, and several Romanesque churches.

Como, Lake (kō'mō), Ital. *Lago di Como* or *Lario*, c. 56 sq. mi. (145 sq. km), 30 mi. (48 km) long and from $\frac{1}{2}$ to $2\frac{1}{2}$ mi. (0.8-4 km) wide, in Lombardy, N. Italy. Lake Como is a natural widening of the Adda River, which feeds and drains the lake. Situated in the foothills of the Alps, the lake is one of the most beautiful of Europe. It is a tourist resort, and handsome villas line its shores. Lecco, Como, Varennes, and Bellagio are principal towns.

Comodoro Rivadavia (kōmōthō'rō rēvāthā'vya), town (1970 pop. 78,479), Chubut prov., S. Argentina, on the Gulf of San Jorge, an inlet of the Atlantic Ocean. The major center of oil production in Argentina, it is connected by a 1,100-mi. (1,770-km) pipeline with Buenos Aires. The town is under military administration, and a government-owned corporation runs the oil wells.

Comonfort, Ignacio (ēgna'syō kōmōnfōrt'), 1812-63, Mexican general and president (1855-58). He was one of the leaders in the liberal Revolution of AYUTLA, which in 1855 overthrew SANTA ANNA and installed Juan ÁLVAREZ in the presidency. Comonfort became acting president upon the resignation of ÁLVAREZ, with his cabinet, particularly Benito JUÁREZ and Miguel LERDO DE TEJADA, he continued the anticlerical liberal program and embodied it in the constitution of 1857. In Dec., 1857, Comonfort, elected under the new constitution, took office as president. The reform program created a furor and awoke rebellion. Comonfort, a half-hearted liberal, at-

tempted to make his position more moderate and was deserted by the liberals. He allowed the conservatives to seize power, then turned against them. Unopposed by either party and opposed by public opinion, he resigned and fled (Jan., 1858) to the United States. He returned to fight against the French invaders and was killed in battle.

Comoro Islands (kōm'arō), French overseas territory (1970 est. pop. 267,000), 838 sq mi (2,170 sq km), an archipelago in the Indian Ocean, at the northern end of the Mozambique Channel, between the Malagasy Republic and Mozambique. The capital and largest city is MORONI. The Comoro Islands comprise the four main islands of Grande Comore—on which Moroni is located—Anjouan, Mayotte, and Moheli, and numerous coral reefs and islets. They are volcanic in origin and have a tropical climate. African peoples are most numerous in the population, although there are many Arabs and Indians in the towns; overpopulation is a problem. Most of the people are Muslim. French is the official language, but Arabic and Swahili are widely spoken. The islands' economy is largely agricultural; the main farming areas are held by foreign companies and feudalistic local landowners. Vanilla, copra, cocoa, sisal, cloves, and essential oils are the major crops and exports. Rice, machinery, and petroleum are the main imports. The islands were populated by successive waves of immigrants from Africa, Indonesia, Madagascar, and Arabia. In 1841 the French persuaded the king of Mayotte to cede Grande Comore. The other islands were ceded between 1866 and 1909. All were occupied by the British during World War II. In 1946 the islands were granted administrative autonomy within the French Union. The territorial assembly voted in Dec., 1958, to remain in the French Republic as an overseas territory. By 1968 internal self-government was achieved. In 1973 negotiations with France led to an agreement for the islands' eventual independence. The territory is represented in the French National Assembly by two deputies and in the Senate by one senator.

Compactata: see HUSSITES

compactor, device used to compress garbage to a relatively small volume so as to facilitate its handling and disposal. Essentially the device consists of a mechanical press that acts to reduce the size of garbage in its container. Environmentally it is advantageous in that it may be used as a substitute for the incinerator, which often generates air pollution. However, compacting makes it more difficult to separate waste materials for recycling.

companies, chartered: see CHARTERED COMPANIES

Company, Luis (lōōēs' kōmpa'nēs), 1883-1940, Spanish politician, Catalan nationalist leader. After the Spanish monarchy fell (1931), he proclaimed an autonomous Catalan republic within the Spanish republic and in 1933 was elected president of CATALUNYA. Pressed by extremists, in 1934 he declared Catalonia fully independent, but this separatist revolt failed and Company was jailed. The leftist electoral victory of 1936 brought him back to power, and he headed the Catalan government throughout the civil war. In 1939 he fled to France, but German occupation forces returned him to Spain in 1940, and he was executed.

company union: see UNION, LABOR

comparative anatomy: see ANATOMY

compass. 1 In mathematics, an instrument for making circles and measuring distances. Frequently called a pair of compasses, it consists of two metal legs with one end of each attached to a pivot to form a V-shaped device. The free ends are pointed, a pen or pencil may be substituted for one of the points. 2 In navigation, an instrument for determining direction. The mariner's compass consists of a magnetic needle freely suspended so that in the earth's magnetic field it turns to align itself with the magnetic north and south poles. Declination is the angle between the magnetic needle and the geographical meridian. Use of the compass by the early Chinese is probably legendary. The first known reference in European literature dates from the 12th cent. Another more accurate form of navigational compass is the gyrocompass. It consists essentially of a rapidly spinning, electrically driven rotor, suspended in such a way that its axis automatically points along the geographical meridian. The gyrocompass is unaffected by magnetic influences. This compass came into wide use in warships and aircraft during the Second World War. See GYROSCOPE.

compass plant or **rosinweed**, large, coarse North American perennial plant (*Silphium laciniatum*) of the family Compositae (COMPOSITE family), found chiefly in open grasslands. The deeply cut leaves

tend to point north and south. It has been used medicinally and is sometimes cultivated. Other plants of similar leaf orientation are sometimes called compass plants. Compass plant is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Asterales, family Compositae.

compensation, workmen's: see WORKMEN'S COMPENSATION

competition, in biology, relationship between members of the same or different species in which individuals are adversely affected by those seeking the same living requirements, such as food or space. Intraspecific competition, i.e., competition between members of the same species, is illustrated by some species of birds and mammals, the males of which set up territories from which all other males of the same species are excluded. In interspecific competition members of different species compete for the same ecologically limiting factors, such as a food source. Not all relationships between organisms are competitive; for example, the commensal relationship between members of different species is non-competitive (see COMMENSALISM).

competition, in economics, rivalry in supplying or acquiring an economic service or good. Sellers compete with other sellers, and buyers with other buyers. Competition among merchants in foreign trade was common in ancient times, but among local retail dealers and among producers it is largely modern, a characteristic of mercantile and industrial expansion after the Middle Ages. By the 19th cent. classical economic theorists had come to regard competition, at least within the national state, as a natural outgrowth of the operation of SUPPLY AND DEMAND. The price of an item was seen as ultimately fixed by the confluence of the two forces. Early capitalist economists argued that supply and demand pricing worked better without any effort at regulation or control. Their model of perfect competition was marked by absolute freedom of trade, widespread knowledge of market conditions, easy access of buyers to sellers, and the absence of all action restraining trade by agencies of the state. Under such conditions no single buyer or seller could materially affect the market price of an item. After c. 1850, practical limitations to perfect competition became evident as industrial and commercial combinations, cooperatives, and trade unions arose to hamper it. Some governments attempted to impose competition by legislation, e.g., the SHERMAN ANTI-TRUST ACT of 1890, but the litigation involved in enforcing such legislation proved cumbersome and uncertain. A later development was government acceptance of the existence of industrial and commercial combinations, together with an effort to apply regulation, administered either by the state or by the industries themselves. Such a view was inherent in the development of the CARTEL in Germany and in the fact that governments have accepted the existence of practical monopolies in the field of public utilities (see UTILITY, PUBLIC). Copyrights, patents, and FAIR-TRADE LAWS also tend to reduce competition. See A. R. Burns, *Decline of Competition* (1936), John K. Galbraith, *American Capitalism: The Concept of Countervailing Power* (rev. ed. 1956, repr. 1962), M. S. Massell, *Competition and Monopoly* (1962, repr. 1964).

Compiègne (kōNpyē'nyā), city (1968 pop. 29,700), Oise dept., N France, in Île-de-France, on the Oise River. It is an industrial center with varied manufactures, a large glassworks is located in the suburbs. As far back as the Merovingian period (7th cent.), Compiègne had been the site of royal gatherings, from the 17th to 19th cent. French monarchs used it as a summer residence. The forest of Compiègne was a royal hunting ground. Joan of Arc was captured (1430) by the Burgundians at Compiègne. In a railroad car in the forest the armistice ending World War I was signed, in 1940, Hitler forced the French to surrender in the same car (which was later taken to Germany and destroyed). The large 15th-century palace, other old structures, and the place's historic connotations attract many tourists.

complement: see IMMUNITY

complementarity principle, physical principle enunciated by Niels Bohr in 1928 stating that certain physical concepts are complementary. If two concepts are complementary, an experiment that clearly illustrates one concept will obscure the other complementary one. For example, an experiment that illustrates the particle properties of light will not show any of the wave properties of light. This principle also implies that only certain kinds of information can be gained in a particular experiment. Other information that is equally important cannot be measured simultaneously and is lost in rigorous

terms the principle states that it is impossible to give simultaneously a space-time description of atomic entities and also a set of mathematical, causal laws describing such entities. The QUANTUM THEORY shows that these two descriptions are statistically related alternatives, complementary and mutually exclusive. A space-time description is limited by the UNCERTAINTY PRINCIPLE, while a causal description in mathematical form can only be stated in terms of other variables. See Werner Heisenberg, *The Physical Principles of the Quantum Theory* (1930, repr. 1949).

complex, term originated by C. G. Jung to indicate a group of feelings and memories resulting from early highly emotional experiences that occupy a dominant but unconscious position in the mind of an individual. Although repressed from consciousness, a complex nevertheless continues to exert a prevailing influence over mental activity and behavior. To the extent that complexes dominate personality, they indicate a disturbed state of consciousness, or what Jung called splinter psyches. Therapists try to bring the complexes into consciousness and release their energy for productive use. See INFERIORITY COMPLEX, OEDIPUS COMPLEX.

complex ion, charged molecular aggregate (see ION), consisting of a metallic atom or ion to which is attached one or more electron-donating molecules. In some complex ions, such as sulfate, SO_4^{2-} , the atoms are so tightly bound together that they act as a single unit. Many complex ions, however, such as tetrammine zinc (II), $\text{Zn}(\text{NH}_3)_4^{2+}$, are only loosely aggregated and tend to dissociate in a water solution until an equilibrium is established between the complex ion and its components (see CHEMICAL EQUILIBRIUM). Such complex ions, or coordinated complexes as they are also called, generally consist of a positively charged central metal atom or ion, like the zinc in tetrammine zinc, surrounded by electron-donating, or basic, groups called LIGANDS, in the tetrammine zinc complex, the NH_3 groups are the ligands. The number of bonds connecting the ligands to the central atom or ion is its coordination number, or ligancy. Transition metals (see TRANSITION ELEMENTS) are especially suited for forming complex ions because they have filled or partially filled electron orbitals that can participate in bonding the ligands to the metal. The bonding holding the ligands to the central atom or ion is similar to covalent bonding between atoms but is more complex (see CHEMICAL BOND). All the ligands surrounding the central ion need not be the same, and some positions can be occupied by solvent molecules. Because ligands remain in a fixed position around a central atom or ion, in many complexes different ISOMERS, or arrangements, of the ligand groups are possible. When there are four or more ligands around a central atom, different stereoisomers, or spatial configurations, are possible (see STEREOCHEMISTRY). Many complex ions are colored, the specific color of a complex depends on both the central atom or ion and the ligands. For example, when cobaltous chloride is dissolved in water, a pale pink solution, sometimes called invisible ink, results because of the presence of the hydrated cobaltous ion, $\text{Co}(\text{H}_2\text{O})_6^{2+}$; this solution does not show up well on paper, but if the paper is heated to drive the water off, visibility improves because of the formation of a blue tetrachlorocobalt (II)- 2 complex. Some of the more important complex ions are vitamin B_{12} , chlorophyll, and the heme component of hemoglobin, in which the central metal ions are cobalt, magnesium, and iron, respectively, and the ligands are complex organic systems. Many enzymes contain a metal ion about which parts of the protein are coordinated.

complex number. see NUMBER

complex variable analysis, branch of MATHEMATICS that deals with the CALCULUS of functions of a complex variable, i.e., a variable of the form $z = x + iy$, where x and y are real and $i = \sqrt{-1}$ (see NUMBER). A function $w = f(z)$ of a complex variable z is separable into two parts, $w = g_1(x, y) + ig_2(x, y)$, where g_1 and g_2 are functions of the real variables x and y . The theory of functions of a complex variable is concerned mainly with functions that have a derivative at every point of a given domain of values for z ; such functions are called analytic, regular, or holomorphic. If a function is analytic in a given domain, then it also has continuous derivatives of higher order and can be expanded in an infinite SERIES in terms of these derivatives (i.e., a Taylor's series). The function can also be expressed in the infinite series

$$f(z) = a_0 + a_1(z - z_0) + a_2(z - z_0)^2 + \dots + a_n(z - z_0)^n + \dots$$

where z_0 is a point in the domain. Also of interest in complex variable analysis are the points in a domain, called singular points, where a function fails to have a derivative. The theory of functions of a complex variable was developed during the 19th century by A. L. Cauchy, C. F. Gauss, G. F. B. Riemann, K. T. Weierstrass, and others.

composite, common name for the Compositae, by far the largest family of vascular plants, totaling an estimated 950 genera and perhaps 20,000 species. They are distributed over most of the earth and in almost all habitats and climates. North American genera number about 230, of which 20 are believed to be naturalized from Europe. The greatest number of composites are herbaceous, some are shrubs, and a few are small trees or climbing plants, chiefly tropical. In the typical composite flower (e.g., the sunflower), what appears to be a single flower is in reality a head of many small flowers. Petalike flowers of the outer ring are called ray flowers and are often sterile. These constitute the more conspicuous part of the head and are adapted in a variety of ways (e.g., in size and color) to attract insects for pollination and to serve as a landing platform for them. The central portion of the head is composed of disk flowers, minute tubular florets nearly always com-

grouping of forms on a two-dimensional plane in depth. In abstract painting forms are generally composed on planes parallel to the picture surface. In illusionistic works (see ILLUSIONISM) with advanced PERSPECTIVE, forms are arranged to accord with the laws of depth perception. Triangular groupings were favored in Renaissance art both for reasons of symmetry and for symbolic connotations of the Trinity.

composition, in ancient and medieval law, a sum of money paid by a guilty party as satisfaction to the family of the person he injured or killed. Failure to make the payment might justify retaliation in kind against the offender or his family. In earliest times, the payment was made as a result of a mutual agreement between the parties, but later it was imposed by law. In many societies the amount paid varied according to the rank of the person injured or slain. Composition reflected a transition from a system of feuds or blood revenge (see VENDETTA) to one where socially dangerous acts are primarily a concern of the state rather than of private persons and their families alone. The exaction of the payment recognized the outrage to the person and the family as the prime offense, but it tended to discourage disorder by providing a substitute for retributive killing or other violence. When, in addition to composition, a fine had to be paid to the state, the dangerous act approached the modern conception of a crime (see CRIMINAL LAW). This institution was known in all Germanic cultures, including Anglo-Saxon England, and was widespread in many parts of the world. It is still practiced in certain Middle Eastern countries. An example of composition is wergild [Old Eng. = man's price], the payment made by a murderer to the family of a murdered person. Wergild was often paid to the king for loss of a subject and to the lord of the manor for the loss of a vassal as well as to the family of the deceased. The term *composition* is also used to refer to an agreement between an insolvent debtor and his creditor, whereby the creditor for some consideration, such as an immediate payment of a portion of the debt, waives the remainder and considers his claim fully satisfied.

composition board, wood product produced in the form of a board or sheet, formed of cellulose fibers or particles derived from wood or other sources, and used principally as a building material. The oldest type of composition board is a relatively dense material known as hardboard, discovered accidentally in 1924 by the American scientist William Mason. After obtaining wood fibers by using high-pressure steam, Mason attempted to dry a matlike mass of them in a steam press. Because of a faulty valve, the press remained hot longer than had been planned and thus the first piece of hardboard was formed. In other forms of composition board the fibers are not as closely packed, and the density is correspondingly lower. Some of these boards find application as insulating and soundproofing materials. Other similar types are treated with waterproofing material, e.g., asphalt applied under pressure, and are usable as the sheathing of buildings. Such materials typically have a resistance to shearing forces exceeding that of plywood. Particle board, another form of composition board, is made by binding wood particles ranging in size from flakes to sawdust together with a suitable adhesive, such as a plastic resin, and pressing or extruding them to form sheets. Particle board is used as a cheaper substitute for plywood in some applications, but even though it has a higher density, it is less resistant to puncture and the effects of weather. When properly veneered it is suitable for making furniture. In its raw form it makes an excellent subflooring for dry locations.

compost, substance composed mainly of partly decayed organic material that is applied to fertilize the soil and to increase its HUMUS content, it is often used in vegetable farming, home gardens, flower beds, lawns, and greenhouses. Compost usually is made from plant materials (e.g., grass clippings, vegetable tops, garden weeds, hay, tree leaves, sawdust, and peat) together with manure and some soil, lime, SUPERPHOSPHATES, and nitrogen fertilizers are often added with manure to reinforce the compost and hasten its decomposition.

Compostela, Santiago de, Spain see SANTIAGO DE COMPOSTELA

compound, in chemistry, a substance composed of ATOMS of two or more ELEMENTS in chemical combination, occurring in fixed, definite proportion and arranged in a fixed, definite structure. A compound has unique properties that are distinct from the properties of its elemental constituents and of all

other compounds. One familiar chemical compound is water, a liquid that is nonflammable and does not support combustion. It is composed of two elements: hydrogen, an extremely flammable gas, and oxygen, a gas that supports combustion. A compound differs from a mixture in that the components of a mixture retain their own properties and may be present in many different proportions. The components of a mixture are not chemically combined; they can be separated by physical means. A mixture of hydrogen and oxygen gases is still a gas and can be separated by physical methods. If the mixture is ignited, however, the two gases undergo a rapid chemical combination to form water. Although the hydrogen and oxygen can occur in any proportion in a mixture of gases, they are always combined in the exact proportion of two atoms of hydrogen to one atom of oxygen when combined in the compound water. Another familiar compound is sodium chloride (common salt). It is composed of the silvery metal sodium and the greenish poisonous gas chlorine combined in the proportion of one atom of sodium to one atom of chlorine. Water is a molecular compound; it is made up of electrically neutral MOLECULES, each containing a fixed number of atoms. Sodium chloride is an ionic compound; it is made up of electrically charged IONS that are present in fixed proportions and are arranged in a regular, geometric pattern (called crystalline structure) but are not grouped into molecules. The atoms in a compound are held together by chemical bonding (see CHEMICAL BOND). A compound is often represented by its chemical FORMULA. The formula for water is H_2O and for sodium chloride, $NaCl$. The FORMULA WEIGHT of a compound can be determined from its formula. The MOLECULAR WEIGHT of a molecular compound can be determined from its molecular formula. Two or more distinct compounds that have the same molecular formula but different properties are called ISOMERS. Compounds are formed from simpler substances by CHEMICAL REACTION. Some compounds can be formed directly from their constituent elements, e.g., water from hydrogen and oxygen: $2H_2 + O_2 \rightarrow 2H_2O$. Other compounds are formed by reaction of an element with another compound, e.g., sodium hydroxide ($NaOH$) is formed (and hydrogen gas released) by the reaction of sodium metal with water: $2Na + 2H_2O \rightarrow 2NaOH + H_2\uparrow$. Compounds are also made by reaction of other compounds, e.g., sodium hydroxide reacts with hydrogen chloride (HCl) to form sodium chloride and water: $HCl + NaOH \rightarrow NaCl + H_2O$. Complex molecules such as proteins are formed by a series of reactions involving elements and simple compounds. Compounds can be decomposed by chemical means into elements or simpler compounds. Water is broken down into hydrogen and oxygen by electrolysis. Candle wax, a mixture of hydrocarbons, is changed in the candle flame by combustion (with oxygen) to a mixture of the simpler compounds carbon dioxide (CO_2) and water. Life is based on numerous reactions in which energy is stored and released as compounds are produced and decomposed.

compound eye see EYE

compressed air, air whose volume has been decreased by the application of pressure. Air is compressed by various devices, including the simple hand pump and the reciprocating, rotary, centrifugal, and axial-flow compressors. Compressed air exerts an expansive force that can be controlled and used in various devices including tires, air brakes, caissons, and diving suits. As a source of power it is used to operate PNEUMATIC TOOLS, e.g., pneumatic hammers and drills and spraying equipment. It is widely employed for cleaning dust and dirt out of mechanical equipment. It is used also in mining, tunneling, and the manufacture of explosives, since it is not a fire hazard. Compressed air is in readily available supply and is easily stored and transported.

compression, external stress applied to an object or substance, tending to cause a decrease in volume (see PRESSURE). Gases can be compressed easily, solids and liquids to a very small degree if at all. Water, for example, is practically incompressible, thus making it especially useful for HYDRAULIC MACHINES. According to the KINETIC-MOLECULAR THEORY OF GASES, when the molecules of a gas are brought close enough together by compression, the gas (under certain conditions of temperature) undergoes LIQUEFACTION. This principle is applied commercially to several gases, including liquid oxygen and the so-called bottled gas (a mixture of hydrocarbons) used as a fuel. Boyle's law deals with the decrease in the volume of a gas in relation to the increase of pres-

Cross section of a sunflower, a member of the composite family

taining both stamens and pistils. The entire composite head is supported by a series of bracts (modified leaves), which arise from the base of the flower stalk and are collectively termed the involucre. The FRUITS of composites are achenes. Many are remarkably adapted for dispersal by animals—e.g., the many burr plants of the family, such as the burdock and cocklebur—or by wind, e.g., the dandelion and goldenrod. Although numerous individual variations exist among the composites, the general flower plan makes the plants readily identifiable and represents the highest evolutionary specialization of flower structure of all dicotyledonous plants. In effect, the community of flowers in a composite head performs by a division of labor the same functions as a single flower in other plants. As a flower structure it ensures pollination, and the effective dispersal variations have made the family widespread and predominant. Taxonomic distinctions within the family are not always clear; botanists sometimes subdivide the Compositae into several families (e.g., the thistle, chicory, and ragweed families) or, more frequently, into tribes. The composite group includes many common weeds and wild flowers, especially late summer and autumn flowers. The pollen of many species causes hay fever. This large family is of minor economic importance. A few species are used for food, usually as salad plants—e.g., lettuce, endive and chicory, salsify, and dandelion, the artichoke is the only commercial table vegetable. Many composites have been used in medicinal preparations. The family is most valuable for its ornamentals. Among the well-known and numerous cultivated species are the asters, daisies, chrysanthemums, marigolds, and zinnias. The composite family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida.

composite order: see CORINTHIAN ORDER

composition, in art, the organization of forms and colors within the work of art. In traditional sculpture this means the arrangement of masses and planes. In representational painting it means the

sure upon it (see GAS LAWS). The ability or the degree to which an internal-combustion engine reduces the volume of its fuel mixture preparatory to firing is called its compression. Also, a region of high pressure in a fluid is called a compression, thus sound waves are said to propagate at compressions and rarefactions (regions of low pressure) of their medium, such as air.

Compromise of 1850 The annexation of Texas to the United States and the gain of new territory by the Treaty of Guadalupe Hidalgo at the close of the Mexican War (1848) aggravated the hostility between North and South concerning the question of the extension of SLAVERY into the territories. The antislavery forces favored the proposal made in the Wilmot Proviso to exclude slavery from all the lands acquired from Mexico. This, naturally, met with violent Southern opposition. When California sought (1849) admittance to the Union as a free state, a grave crisis threatened. Also causing friction was the conflict over the boundary claims of Texas, which extended far westward into territory claimed by the United States. In addition, the questions of the slave trade and the FUGITIVE SLAVE LAWS had long been vexing. There was some fear that, in the event of strong antislavery legislation, the Southern states might withdraw from the Union altogether. The possibility of the disintegration of the Union was deprecated by many but was alarming to some, among them Henry CLAY, who emerged from retirement to enter the Senate again. President TAYLOR was among those who felt that the Union was not threatened, he favored admission of California as a free state and encouragement of New Mexico to enter as a free state. These sentiments were voiced in Congress by William H. SEWARD, John C. CALHOUN and other Southerners, particularly Jefferson DAVIS, maintained that the South should be given guarantees of equal position in the territories, of the execution of fugitive slave laws, and of protection against the abolitionists. Clay proposed that a series of measures be passed as an omnibus compromise bill. Support for this plan was largely organized by Stephen A. DOUGLASS. The measures were the admission of California as a free state, the organization of New Mexico and Utah territories without mention of slavery, the status of that institution to be determined by the territories themselves when they were ready to be admitted as states (this formula came to be known as POPULAR SOVEREIGNTY), the prohibition of the slave trade in the District of Columbia, a more stringent fugitive slave law, and the settlement of Texas boundary claims by Federal payment of \$10 million on the debt contracted by the republic of Texas. These proposals faced great opposition, but Daniel WEBSTER greatly enhanced the chances for their acceptance by his famous speech on March 7, 1850. Taylor's death and the accession of conservative Millard FILLMORE to the presidency made the compromise more feasible. After long debates and failure to pass the omnibus bill, Congress passed the measures as separate bills in Sept., 1850. Many people, North and South, hailed the compromise as a final solution to the question of slavery in the territories. However, the issue reemerged in 1854 with the KANSAS-NEBRASKA ACT, and seven years later the factions were fighting the Civil War. See E. C. Rozwenc, *The Compromise of 1850* (1957), Holman Hamilton, *Prologue to Conflict* (1964).

Compton, Arthur Holly, 1892-1962, American physicist, b. Wooster, Ohio, grad. College of Wooster (B.S., 1913), Ph.D. Princeton, 1916. He was professor and head of the department of physics at Washington Univ., St. Louis (1920-23), and professor of physics at the Univ. of Chicago (1923-45), where he helped to develop the atomic bomb. He returned to Washington Univ. where he was chancellor (1945-53) and professor (from 1953). For his discovery of the COMPTON EFFECT he shared with C. T. R. Wilson the 1927 Nobel Prize in Physics. In addition to his work on X rays he made valuable studies of cosmic rays. His writings include *X Rays and Electrons* (1926, 2d ed., with S. K. Allison, *X-Rays in Theory and Experiment*, 1935), *The Human Meaning of Science* (1940), and *Atomic Quest* (1956). See his *Cosmos of Arthur Holly Compton*, ed. by Marjorie Johnston (1968) and *Scientific Papers*, ed. and with an intro. by R. S. Shankland (1973).

Compton, Karl Taylor, 1887-1954, American physicist, b. Wooster, Ohio, grad. College of Wooster (Ph.B., 1908), Princeton (Ph.D., 1912), brother of A. H. Compton. He taught at Princeton from 1915 to 1930 (as professor from 1919) and was president of the Massachusetts Institute of Technology from 1930

to 1948. From 1948 to 1949 he was chairman of the research and development board of the National Military Establishment. He did notable research on photoelectricity, radar, ionization of gases, ultraviolet spectroscopy, and electric arcs.

Compton, city (1970 pop. 76,611), Los Angeles co., S. Calif., a residential and industrial suburb between Los Angeles and Long Beach, inc. 1888. It has aircraft, electronic, oil, chemical, and steel industries. A junior college is there.

Compton-Burnett, Dame Ivy, 1892-1969, English novelist. Educated at the Univ. of London, she lived quietly in London for most of her life. She was named a Dame Commander of the British Empire in 1967. Ivy Compton-Burnett's unconventional novels of the Edwardian gentry reveal beneath their irony, satire, and wit an embittered, frightful world of hypocrisy and cruelty. Her writings are noted for their lack of plot, their absence of description and characterization, and their almost complete reliance on articulate, highly stylized conversations. Among her most notable works are *Brother and Sister* (1929), *A House and Its Head* (1935), *Manservant and Maid-servant* (1947), *Mother and Son* (1955), *The Mighty and Their Fall* (1961), and *The Last and the First* (1971). See biography by Elizabeth Sprigge (1973), study by Charles Burkhart (1965).

Compton effect [for A. H. Compton], increase in the wavelengths of X rays and gamma rays when they collide with and are scattered from loosely bound electrons in matter. This effect provides strong verification of the quantum theory since the theoretical explanation of the effect requires that one treat the X rays and gamma rays as particles or photons (quanta of energy) rather than as waves. The classical treatment of these rays as waves would predict no such effect. According to the quantum theory a photon can transfer part of its energy to a loosely bound electron in a collision. Since the energy of a photon is proportional to its frequency, after the collision the photon has a lower frequency and thus a longer wavelength. The increase in the wavelength does not depend upon the wavelength of the incident rays or upon the target material. It depends only upon the angle that is formed between the incident and scattered rays. A larger scattering angle will yield a larger increase in wavelength. The effect was discovered in 1923. It is used in the study of electrons in matter and in the production of variable energy gamma-ray beams.

compurgation (kōm'pārgā'shən), in medieval law, a complete defense. A defendant could establish his innocence or nonliability by taking an oath and by getting a required number of persons to swear they believed his oath. Compurgation, also called *wager of law*, was found in early Germanic law and in English ecclesiastical law until the 17th cent. In common law it was substantially abolished as a defense in felonies by the Constitutions of Clarendon (1164). Compurgation was still permitted in civil actions for debt, however, and vestiges of it survived until its final abolition in 1833. It is doubtful whether compurgation ever existed in America.

computer, device capable of performing a series of calculations or logical operations without human intervention. Although such devices as the ABACUS and the desk CALCULATING MACHINE have limited calculating capacities, the computer is characterized by the number and complexity of operations it can perform and by its ability to store, retrieve, and process data. Computers are of two types, analog and

digital. An analog computer is designed to process data in which the variable quantities vary continuously (see ANALOG CIRCUIT); it translates the relationships between the variables of a problem into analogous relationships between electrical quantities, such as current and voltage, and solves the original problem by solving the equivalent problem, or analog, that is set up in its electrical circuits. Because of this feature, analog computers are especially useful in the simulation and evaluation of dynamic situations, such as the flight of a space capsule or the changing weather patterns over a certain area. The key component of the analog computer is the OPERATIONAL AMPLIFIER, and the computer's capacity is determined by the number of amplifiers it contains (often over 100). A digital computer is designed to process data in numerical form (see DIGITAL CIRCUIT); its circuits perform directly the mathematical operations of addition, subtraction, multiplication, and division. The numbers operated on by a digital computer are expressed in the BINARY SYSTEM, binary digits, or bits, are 0 and 1, so that 0, 1, 10, 11, 100, 101, etc. correspond to 0, 1, 2, 3, 4, 5, etc. Binary digits are easily expressed in the computer circuitry by the presence (1) or absence (0) of a current or voltage. A string of such bits is sometimes called a digital word; it may specify not only the magnitude of the number in question, but also its sign (positive or negative), and may also contain redundant bits that allow automatic detection of certain errors (see CODE, INFORMATION THEORY). A digital computer can store the results of its calculations for later use, can compare results with other data, and on the basis of such comparisons can change the series of operations it performs. The operations of a digital computer are carried out by LOGIC CIRCUITS, which are digital circuits whose single output is determined by the conditions of the inputs, usually two or more. The various circuits processing data in the computer's interior must operate in synchronism; this is accomplished by controlling them with a very stable OSCILLATOR, which acts as the computer's "clock." Typical computer clock rates range from several million cycles per second to several hundred million, with some of the fastest computers having clock rates of about a billion cycles per second. Operating at these speeds, digital computers are capable of performing thousands to millions of arithmetic operations per second, thus permitting the rapid solution of problems so long that they would be impossible for a human to solve by hand. In addition to the arithmetic or logic circuitry and a small number of registers that hold intermediate results, the heart of the computer also contains the central processor—circuitry that decodes the set of instructions, or program, and causes it to be executed—and the storage unit, or memory, where results or other data are stored for periods of time ranging from a small fraction of a second to many months. Since the central processor can operate no faster than the rate at which data is fed to it, it is important that access to this internal memory be very rapid. The basic elements of such a memory are usually either magnetic cores, which store one bit of information according to the direction in which the cores are magnetized, or electronic circuits, which store one bit by being switched either on or off. Magnetic cores have the advantage of not needing power to maintain stored data, but they operate more slowly than electronic circuits. Both are costly and require means for regenerating stored data that would otherwise be lost at various times. For this reason most computers are also equipped with bulk storage systems using equipment such as magnetic tape, magnetic disks, magnetic drums, punched paper tape, or punched paper cards. In a system using magnetic tape the information is stored by a specially designed TAPE RECORDER somewhat similar to one used for recording sound. In disk and drum systems the principle is the same except that the magnetic medium lies in a closed path, or track, on the surface of a disk or cylinder, with a separate magnetic head serving each track. Of these systems disks are the fastest and most efficient. Drum systems operate about as fast but are wasteful of space; this defect has rendered them virtually obsolete. Paper tapes and cards suffer from the same problem as magnetic tape, namely that a good deal of search time may be needed to find a particular item of data, and they operate even more slowly than tape. Before a computer can be used to solve a given problem, it must first be programmed, that is, prepared for solving the problem by being given a set of instructions, or program. Each instruction in the program is a simple, single step, telling the computer to perform some arithmetic

Schematic diagram of a computer system. Data flow is indicated by solid lines, control signals are indicated by dashed lines.

tic operation, read the data from some given location in the memory, compare two numbers, or take some other action. The program is entered into the computer's memory exactly as if it were data, and on activation, the machine is directed to treat this material in the memory as instructions. Other data may then be read in and the computer can carry out the program to solve the particular problem. Since computers are designed to operate with binary numbers, all data and instructions must be represented in this form, the machine language, in which the computer operates internally, consists of the various binary codes that define instructions together with the formats in which the instructions are written. Since it is time-consuming and tedious for a programmer to work in actual machine language, an intermediate programming language, or assembly language, designed for the programmer's convenience, is used for the writing of most programs. The computer is programmed to translate a given assembly language into machine language and then solve the original problem for which the program was written. Assembly languages vary from machine to machine. Certain programming languages are universal, varying little from machine to machine. These are usually designed for particular types of problems. For example, FORTRAN is for scientific and mathematical use, COBOL for business use, PL/1 for general use, and ALGOL for mathematical use. The various programs by which a computer controls aspects of its operations, such as those for translating data from one form to another, are known as software, as contrasted with hardware, which is the physical equipment comprising the installation. Once a program has been prepared, it must be fed into the computer through the machine's input facilities. This is accomplished most often by means of written language, either on paper, in which case it is called hard copy, or on the face of a cathode-ray tube, in which case it is called soft copy. Human beings communicate with the computer by means of teletypewriters, machines that punch paper cards and tapes for presentation to the computer, and special devices such as GRAPHIC TERMINALS. Generally, the slowest operations that a computer must perform are those of transferring data, particularly when the data is received from or delivered to a human being. In large installations, this problem is often alleviated by using small computers to handle data input and output for a larger one. In a fairly recent development known as time-sharing, a single fast computer serves a number of remote data terminals. The computer switches from one terminal to another so quickly that many different users at different terminals can use the computer at the same time without any one of them being aware of the others. Human beings may also communicate with the computer directly through its control panel, however, except for initiating and concluding long periods of operation this is very wasteful, as a vast amount of computing time is lost in the time it takes a human being to respond to an output message. In most moderate to large installations the moment-to-moment control of the machine resides in a special software program called an operating system, or supervisor. Other forms of software include assemblers and compilers for programming languages. Software is of great importance, the usefulness of a highly sophisticated array of hardware can be severely compromised by the lack of adequate software. Advances in the technology of INTEGRATED CIRCUITS has spurred the development of smaller computers, sometimes called minicomputers. These, because of their relatively low cost, are increasingly being used in place of analog computers for single-purpose operation. They are also good for general use in small installations. Except for tasks requiring human creativity, the applications of the digital computer are virtually limitless, such limitations as there are being principally related to difficulty in acquiring adequate data for the computer or in reducing the data to numbers. This is an area of continuing research for new applications and improvements in hardware and software. American scientist Vannevar Bush built a mechanically operated device, called a differential analyzer, in 1930. It was the first general-purpose analog computer. In the 19th cent. British mathematician Charles Babbage designed, but did not build, a mechanical digital device capable of processing information as a modern computer does. The first information-processing digital computer actually built was the Automatic Sequence Controlled Calculator, or Mark I computer. Completed in 1944, this electro-mechanical device was designed by American engineer Howard Aiken. In 1946 the Electronic Numerical

cal Integrator and Computer, or ENIAC, was put into operation. Using thousands of electron tubes, it was the first electronic digital computer. In the late 1950s transistors replaced electron tubes in computers, allowing a reduction in the size and power consumption of computer components. During this period FORTRAN and ALGOL, and later COBOL, were introduced. In the 1960s hybrid computers were formed by connecting analog computers to digital ones. Later integrated circuits were developed that allowed further reduction in component size and increase in reliability. See John Pfeiffer, *The Thinking Machine* (1962), Jeremy Bernstein, *The Analytic Engine: Computers—Past, Present and Future* (1963), D. G. Fink, *Computers and the Human Mind* (1966), R. R. Fenichel and J. Weizenbaum, ed., *Computers and Computation: Readings from Scientific American* (1971), Irving Adler, *Thinking Machines* (rev. ed. 1973), Craig Fields, *About Computers* (1973), J. M. Adams, *Computers* (1973), R. C. Dorf, *Computers and Man* (1974).

computer music, music composed or performed with the aid of a computer. For composition, the computer is programmed to select or reject elements from a pre-established, digitally represented sound domain. The result is either transcribed into conventional musical notation or electrically synthesized. Sound production consists of a digital program effecting filters and/or oscillators to generate electrical signals whose parameters—amplitude, frequency—can be heard as sound events when they are transcribed onto magnetic tape, amplified, and played through loudspeakers. The Columbia-Princeton Electronic Music Studio is a major center for the production of computer music.

Comstock, Anthony, 1844-1915, American morals crusader, b. New Canaan, Conn. He served with the Union army in the Civil War and was later active in advocating the suppression of obscene literature. He was the author of the comprehensive New York state statute (1868) forbidding immoral works, and in 1873 he secured stricter Federal postal legislation against obscene matter. That same year he organized the New York Society for the Suppression of Vice. As secretary of the society until his death, Comstock was responsible for the destruction of 160 tons of literature and pictures. For his liberal enemies he became the symbol of licensed bigotry and for his supporters the symbol of stalwart defense of conventional morals. Comstock also inspired the Watch and Ward Society of Boston. See biographies by Heywood Brown and Margaret Leech (1927) and De Robinge Bennett (repr. 1971).

Comstock, Henry Tompkins Paige: see COMSTOCK LODGE

Comstock Lode, richest known U.S. silver deposit, W. Nevada, on Mt. Davidson in the Virginia Range. It is said to have been discovered in 1857 by Ethan Allen Grosh and Hosea Ballou Grosh, sons of a Pennsylvania minister and veterans of the California gold fields who died under tragic circumstances before their claims were recorded. Henry T. P. Comstock, known as Old Pancake, was a sheepherder and prospector who took possession of the brothers' cabin and tried to find their old sites. He and others searching for gold laid claim to sections of the Comstock (1859) but soon sold them for insignificant sums. The lode did not become really profitable until its bluish sand was assayed as silver. News of the discovery then spread rapidly, attracting promoters and traders as well as miners, and the lode was the scene of feverish activity. Among early arrivals was William Morris Stewart, who later became one of Nevada's first senators. Camps and trading posts in the area became important supply centers, and Virginia City, a mining camp on the mountain, was for several decades the "capital" of the lode and a center of fabulous luxury. Great fortunes were made by the "silver kings," John W. Mackay, James Graham Fair, James C. Flood, and William S. O'Brien, and by Adolph Sutro, George Hearst, and Elley Orrum Bowers. Silver determined the economy and development of Nevada until exhaustion of the mines by wasteful methods of mining and the demonetization of silver started a decline in the 1870s. By 1898 the Comstock was virtually abandoned. See Grant Smith, *History of the Comstock Lode* (1943), George Lyman, *The Saga of the Comstock Lode* (1934, repr. 1971), Lucius Beebe and Charles Clegg, *Legends of the Comstock Lode* (4th ed. 1956).

Comtat Venaissin (kəNtā' vənəNsāN') or **Comtat**, region of SE France, Vaucluse dept., comprising the territory around AVIGNON. Well-irrigated, it is a truck-farming and fruit-growing area. Comtat Ven-

assin was given by King Philip III to Pope Gregory X in 1274. Succeeding French kings sought to regain the region, but it remained in papal hands until 1791, when a plebiscite was held and the inhabitants voted to reunite with France. The region's historic capital was CARPENTRAS.

Comte, Auguste (ōgust' kōNt), 1798-1857, French philosopher, founder of the school of philosophy known as POSITIVISM, educated in Paris. From 1818 to 1824 he contributed to the publications of Saint-Simon, and the direction of much of Comte's future work may be attributed to this association. Comte was primarily a social reformer. His goal was a society in which individuals and nations could live in harmony and comfort. His system for achieving such a society is presented in his *Cours de philosophie positive* (1830-42, tr. *The Course of Positive Philosophy*, 1896 ed.). In this work Comte analyzes the relation of social evolution and the stages of science. He sees the intellectual development of man covered by what is called the Law of the Three Stages—theological, in which events were largely attributed to supernatural forces, metaphysical, in which natural phenomena are thought to result from fundamental energies or ideas, positive, in which phenomena are explained by observation, hypotheses, and experimentation. The sciences themselves are classified on the basis of increasing complexity and decreasing generality of application in the ascending order: mathematics, astronomy, physics, chemistry, biology, and sociology. Each science depends at least in part on the science preceding it, hence all contribute to sociology (a term that Comte himself originated). A sociology developed by the methods of positivism could achieve the ends of harmony and well-being which Comte desired. Another work, *Le Système de politique positive* (1851-54, tr. *System of Positive Polity*, 1875-77), placed religion above sociology as the highest science, it was, however, a religion shorn of metaphysical implications, with humanity as the object of worship. For a modern edition of part of this work see *A General View of Positivism* (1957). Important among his other writings are *Catechisme positiviste* (1852, tr. 1858) and *Synthese subjective* (1856). Published posthumously were his *Testament* (1884) and his letters (1902-05). See R. L. Hawkins, *Auguste Comte and the United States, 1816-1853* (1936) and *Positivism in the United States, 1853-1861* (1938), F. S. Marvin, *Comte, the Founder of Sociology* (1937, repr. 1965).

comuneros (kōmōnā'rōs), in Spain and Spanish America, citizens of a city or cities when organized to defend their rights against arbitrary encroachment of government. The first great revolt of comuneros in Spain was the uprising (1520-21) of the *comunidades* (autonomous cities) of Castile against the measures of Emperor CHARLES V. In Spanish America, the revolt of the comuneros of Paraguay, led by ANTEQUERA Y CASTRO against Gov. Diego de los Reyes Balmaseda and continuing against viceregal and Jesuit opposition from 1723 to 1735, was one of the first considerable democratic uprisings of Latin America. In the comunero insurrection of New Granada (1780-81), 60 cabildos rejected new taxes and sought reforms.

Comus (kō'mas), in late Roman legend, god of mirth and revelry. A follower of Dionysus, he was represented as a drunken youth bearing a torch. In Milton's poetic masque, *Comus*, he is the mischievous son of Bacchus and Circe.

Comyn, John (kūm'ĭn), d. c. 1300, Scottish nobleman, known as the Black Comyn. In 1286 he became one of the six regents for MARGARET MAID OF NORWAY and, as such, agreed to the treaty of 1290, by which Margaret was to marry the eldest son of Edward I of England. After her death, he was at first a claimant for the vacant throne but then supported the claim of his brother-in-law, John de BALIOL, who was awarded the crown by Edward I of England in 1292. Comyn joined Baliol in his revolt against Edward but submitted to the English king in 1296. The name also appears as Cumming.

Comyn, John, d. 1306, Scottish nobleman. He was called the Red Comyn, to distinguish him from his father, the Black Comyn. Aiding his uncle, John de BALIOL, in the struggle against Edward I, he was for a time held hostage by the English. After the rout of the Scottish troops at Falkirk (1298), he was appointed one of the guardians of the realm. He renewed the struggle with Edward, but surrendered in 1304 on condition that he could retain his lands. He was murdered at Dumfries by Robert the Bruce (later ROBERT I), probably because Robert feared him as a rival claimant to the throne. The name also appears as Cumming.

Conakry (kōn'āk'rē), city (1972 pop est., with suburbs, 290,000), capital of Guinea and its Conakry region, SW Guinea, a port on the Atlantic Ocean. Located on Tombo island and connected with the mainland by a causeway, Conakry is Guinea's largest city and its administrative, communications, and economic center. Its economy revolves largely around the port, which has modern facilities for handling and storing cargo, and from which Guinea's chief exports, alumina and bananas, are shipped. A railroad connects Conakry with Kankan, E Guinea, and roads run to the Ivory Coast, Senegal, and Mali. The few local manufactures include food products and beverages, iron ore and bauxite were mined nearby until the late 1960s. In 1887, Conakry was occupied by French forces. Its main growth dates from World War II, and today it is a modern city with wide boulevards and fine botanical gardens. The Polytechnical Institute of Conakry (1963) and a school of administration are located there.

Conaniah (kōn'ān'ā), Levite of Josiah's time 2 Chron 35 9

Conant, James Bryant (kō'nənt), 1893-, American educator, b Dorchester, Mass., grad Harvard (B A, 1913, Ph D, 1916). Except for a brief period in the army (1917-19), Conant taught chemistry at Harvard from 1916 until 1933, serving as chairman of the department during the last three years. He was president of Harvard from 1933 until his resignation in 1953. Conant was chairman (1941-46) of the National Defense Research Committee, in 1953 he was appointed U.S. High Commissioner for Germany and later served as ambassador to West Germany (1955-57). He directed a number of extensive investigations of American education and has published widely in the field. Conant's writings include *Education in a Divided World* (1948), *Modern Science and Modern Man* (1952), *Education and Liberty* (1953), *Slums and Suburbs* (1961), *The Comprehensive High School* (1967), *Scientific Principles and Moral Conduct* (1967), and his autobiography, *My Several Lives* (1970).

Conant, Roger, 1592-1679, one of the founders of Massachusetts, b East Sudleigh, Devonshire, England. He was a salter in London before he went to Plymouth in 1623. Conant lived at Nantasket from 1624 to 1625, when he was appointed to manage the Dorchester Company's settlement on Cape Ann. In 1626, with about 20 settlers, he founded Salem (Naumkeag) and later was the leading citizen of Beverly, which was incorporated (1668) largely because of his efforts. See biography by C. K. Shipton (1944).

Conant, Thomas Jefferson, 1802-91, American biblical scholar and editor of many translations of books of the Bible. He aided in the revision of the English Bible completed in 1881.

conceit, in literature, fanciful or unusual image in which apparently dissimilar things are shown to have a relationship. The Elizabethan poets were fond of Petrarchan conceits, which were conventional comparisons, imitated from the love songs of Petrarch, in which the beloved was compared to a flower, a garden, or the like. The device was also used by the METAPHYSICAL POETS, who fashioned conceits that were witty, complex, intellectual, and often startling, e.g., John Donne's comparison of two souls with two bullets in "The Dissolution." Samuel Johnson disapproved of such strained metaphors, declaring that in the conceit "the most heterogeneous ideas are yoked by violence together." Such modern poets as Emily Dickinson and T. S. Eliot have used conceits.

concentration, in chemistry, measure of the relative proportions of two or more quantities in a MIXTURE. Concentration may be expressed in a number of ways. The simplest statement of the concentrations of the components of a mixture is in terms of their percentages by weight or volume. Mixtures of solids or liquids are frequently specified by weight percentage concentrations, such as alloys of metals or mixtures used in cooking, whereas mixtures of gases are usually specified by volume percentages. Very low concentrations may be expressed in parts per million (ppm), as in specifying the relative presence of various substances in the atmosphere. In addition to these means of expressing concentration, several others are defined especially for describing SOLUTIONS: molarity, molality, mole fraction, formality, and normality. Some of these define the concentration of the solute in reference to the amount of solvent, others in reference to the total amount of solution. The molality of a solution is the number of moles of solute per liter of solution, e.g., a solution of glucose in water containing 180.16 grams (1

gram-molecular weight, or mole) of glucose per liter of solution is referred to as one molar (1 M). The molality of a solution is the number of moles of solute per 1,000 grams of solvent, a solution prepared by dissolving 180.16 grams of glucose in 1,000 grams of water is one molal (1 m). The mole fraction of a solution is the ratio of moles of solute to the total number of moles in the solution. Since ionic compounds, such as sodium chloride, NaCl, do not occur as molecules, their concentrations cannot be expressed in terms of molality, molality, or mole fraction. Instead, the concentration of an ionic compound in solution may be given by its formality, the number of gram-formula weights of the compound per liter of solution, e.g., a solution containing 58.44 grams (one gram-formula weight) of NaCl per liter of solution is one formal (1 F). In considering the reactions of certain solutions in combination, for example the NEUTRALIZATION of acids and bases, a useful expression of the concentration is the normality of each solution, the number of gram-equivalent weights of solute per liter of solution (see EQUIVALENT WEIGHT), e.g., a solution containing 49.04 grams (one gram-equivalent weight) of sulfuric acid, H₂SO₄, per liter of solution is one normal (1 N). Concentrations of solutions may also frequently be given in terms of the weight of solute in a given volume of solvent or solution. The concentration of a solute is very important in studying chemical reactions because it determines how often molecules collide in solution and thus indirectly determines the rates of reactions and the conditions at equilibrium (see CHEMICAL EQUILIBRIUM).

concentration camp, prison created outside the normal prison system for particular categories of people, usually for political reasons. After Adolf Hitler's rise to power in 1933, concentration camps were set up throughout Germany for detaining persons, especially Jews and Communists, considered undesirable by the Nazis (see NATIONAL SOCIALISM). No legal procedure was required for commitment. Inmates performed hard labor under the supervision of SS guards notorious for their brutality. During World War II concentration camps mushroomed throughout German-occupied Europe. Of the millions of people of many nationalities detained in them, a large proportion died of mistreatment, malnutrition, and disease. Several camps were extermination camps. In the best known of these—Majdanek, Treblinka, and Oswiecim (Auschwitz), in Poland—more than 6 million men, women, and children (mostly Jews and Poles) were killed in gas chambers. Documented proof of these horrors, used in later war-crimes trials, includes unmentionable details of sadism, sometimes perpetrated under the guise of medical experiments. Among the most notorious camps liberated by U.S. and British troops in 1945 were Buchenwald, Dachau, and Belsen. The term concentration camp has also been used to include forced-labor camps in which political prisoners are confined and any camps used to confine minority groups.

Concepcion (kōnsēpsēōn'), city (1970 pop 189,929), capital of Concepcion prov., S central Chile, near the mouth of the Bio-Bio River. It is an industrial and commercial center and one of Chile's major cities. Its port, Talcahuano, just north of the city, ships the products of the surrounding rich agricultural region. Concepcion's industries produce glass, textiles, sugar, hides, and steel. Founded in 1550 by Pedro de Valdivia, the Spanish conqueror of Chile, the city was besieged and destroyed by the Araucanian chief Lautaro in 1554-55. It was completely destroyed by earthquakes in 1570, 1730, 1751, 1835, and 1939, and was severely damaged in 1960. Its numerous rebuildings have given Concepcion a modern appearance. Points of interest include the Plaza Independencia and a university.

Concepcion del Uruguay (dēl ōrōōgwī'), city (1970 pop 73,720), Entre Rios prov., NE Argentina, a port on the Uruguay River. It ships the grain and beef of the surrounding region. The city was founded in 1778 and was twice the capital of Argentina in the 19th cent. It was the scene of a revolt (1870) that culminated in the assassination of ex-president Justo José de Urquiza.

conceptualism, in philosophy, position taken on the problem of UNIVERSALS, initially by Peter ABELARD in the 12th cent. Like nominalism it denied that universals exist independently of the mind, but it held that universals have an existence in the mind as concept. These concepts are not arbitrary inventions but are reflections of similarities among particular things themselves, e.g., the concept male reflects a similarity between Paul and John. This similarity

shows that universals are also patterns in God's mind according to which he creates particular things. Slightly modified, this view becomes the position of moderate REALISM, the classical medieval solution to the controversy. For a modern statement of conceptualism, see C. I. Lewis, *Analysis of Knowledge and Valuation* (1946, repr 1962).

concert, in music, public performance of a group of musical compositions. Originally the word referred simply to a group of musicians playing together, concerts by a solo performer are properly called recitals. The earliest recorded public concerts were organized by a London violinist, John Banister, in 1672. Many orchestral concerts were given in the 18th cent., and early in the 19th cent., which saw great development of concert life, public concerts of chamber music were given. In the American colonies, the first concert on record took place in Boston in 1731.

concertina (kōnsürtē'nə), musical instrument whose tone is produced by free reeds. It was invented by Sir Charles Wheatstone in 1829. It is a

Concertina

chromatic instrument similar to the ACCORDION, but its bellows are attached to hexagonal blocks having handles and buttons (finger pistons), and it is smaller. It is mainly associated with popular music.

concerto (kanchâr'tō), musical composition usually for an orchestra and a soloist or a group of soloists. In the 16th cent. the term was applied to music for an ensemble, either vocal or instrumental. At the end of the century it referred to music in which two ensembles contested with each other. By 1750 it meant music contrasting a full ensemble with soloists in alternation. The form known as *concerto grosso* is characterized by a small group of solo players contrasted with the full orchestra. Giuseppe Torelli (1658-1709) and VIVALDI established the *concerto grosso* in three movements, while CORELLI used four or more. These three composers were active in the development of all forms of the concerto in the baroque period. J. S. Bach's six Brandenburg concertos and the concertos of Handel represent the fullest development of the baroque type. Toward the end of the 18th cent. the solo concerto displaced the *concerto grosso*. Mozart established the classical concerto in three movements, the first of which is a sonata as in a symphony, for solo instrument and orchestra. Beethoven expanded the dimensions of this form, giving greater importance to the orchestra. In the 19th cent. Liszt unified the concerto by using the same themes in all movements. He was one of numerous composers to use the concerto form as a showcase for virtuoso display in the solo. The concerto repertory is strongest in works for piano and violin as the solo instrument. In the 20th cent. renewed interest in the *concerto grosso* has been manifested by such composers as Hindemith, Bartok, and Bloch. See A. J. B. Hutchings, *The Baroque Concerto* (1961), Abraham Vainus, *The Concerto* (rev ed 1964), D. F. Tovey, *Essays in Musical Analysis: Concertos* (1936, repr 1972).

Concert of Europe, term used in the 19th cent. to designate a loose agreement by the major European powers to act together on European questions of common interest. The concert emerged after the Congress of Vienna (1814-15) and included the QUADRUPLÉ ALLIANCE powers of Great Britain, Austria, Prussia, and Russia, and, as of 1818, France as well. It aimed to preserve peace by concerted diplomatic action reinforced by periodic conferences dealing with problems of mutual concern.

concerto grosso. see CONCERTO

conch, common name for certain marine GASTROPOD mollusks having a heavy, spiral shell, the whorls of which overlap each other. In conchs the characteristic gastropod foot is reduced in size and the operculum, a horny plate located on the foot and used to seal the shell opening in many gastropods, has the appearance and function of a claw. During locomotion, the operculum secures a foothold in the sand, and the conch jumps forward by means of the quick contraction of a retractor muscle called the columella muscle. Thus the conch lacks the

creeping motion of most gastropods. The king conch, *Strombus gigas*, found in the warmer waters of the Atlantic, Caribbean, and Gulf of Mexico, has a shell 10 to 12 in (25–30 cm) long and may weigh up to 5 lb (2.3 kg). Similar in size and distribution is the queen conch, *Cassia cameo*. Its shell has been used in Europe to carve cameos. Conch shells range in color from white to red; they have been used by man to fashion a number of items, such as buttons, ornaments, or the crude trumpets made from the shell of the trumpet conch, *Charonia tritonis*. This conch is similar in shape to the king and queen conchs but is much more slender and reaches a length of 20 in (50 cm). *C. tritonis* is found in the Gulf of Mexico and the Indian Ocean. The largest conch and also one of the largest univalves in the world is the horse conch, *Pleuroploca gigantea*, having a shell length of 24 in (60 cm). It is found along the Atlantic Coast from North Carolina to Brazil. The body can retreat entirely into the shell and remain there for months if unfavorable conditions prevail. An unusual conch shell is that of the spider conch, *Lambis lambis*, which has leglike projections. Spider conchs are voracious carnivores, common on coral reefs. They also feed on algae, as do the king conchs. Most conchs are carnivorous, feeding on bivalve mollusks, some are scavengers as well. They inhabit tropical waters and have been used as a food source for man. The conch is classified in the phylum MOLLUSCA, class Gastropoda, order Mesogastropoda.

Conchos (kōn'chōs), river, c 350 mi (560 km) long, rising in S Chihuahua state, N Mexico, and flowing N and NE to the Rio Grande. Dams along its middle course provide water for extensive cotton oases just south of the city of Chihuahua.

conciliation see MEDIATION

Concini, Concino (kōnchē'nō kōnchē'nē), d 1617, Florentine adventurer, favorite of MARIE DE' MEDICI, queen of France, who made him marshal of France (1613). In 1610 he was made marquis d'Ancre. He exerted great influence after the death of Marie's husband, Henry IV, and succeeded the duke of Sully as minister. His greed and his spy system won him the hatred of all classes. His efforts to weaken the nobility provoked an unsuccessful revolt (1615) led by Henri II de CONDÉ. In 1617, Louis XIII had Concini assassinated. His wife, Leonora Galigai (1571?–1617), lady in waiting and favorite of the queen, was beheaded and burned for sorcery.

Concord (1, 2, 3, kōng'kard, 4 kōn'kōrd") 1 Residential city (1970 pop 85,164), Contra Costa co., W central Calif., in an oil and farm region, settled c 1852, inc 1905. Electronic equipment is made. The city is the eastern terminus for rapid transit to the San Francisco Bay area. A junior college is there, and a U.S. naval ammunition depot is nearby. 2 Town (1970 pop 16,148), Middlesex co., E Mass., on the Concord River, inc 1635. Electronic and wood products are made. The site of the Revolutionary battle of Concord on April 19, 1775 (see LEXINGTON AND CONCORD BATTLES OF), is marked by Daniel Chester French's bronze Minute Man. Concord has many fine old houses, some opened as memorials to noted occupants—Emerson, the Alcotts, Hawthorne, and Thoreau. An antiquarian museum and the Old Manse, built in 1769 by Emerson's grandfather and made famous by Thoreau, and the place where Ephraim Bull developed the Concord grape are there. 3 City (1970 pop 30,022), state capital and seat of Merrimack co., 5 central N.H., on the Merrimack River, settled 1725–27, inc as Rumford, Mass., in 1733 (Count RUMFORD later took his title from this name) and as Concord, N.H., in 1765. Famous for its granite, the city also has a printing industry and plants making leather goods, electrical equipment, furniture, stone and clay products, textiles and apparel, metalware, and food. It became the state capital in 1808, and its growth was further aided by the building of the Middlesex Canal in 1815. St. Paul's school (preparatory) and the house of Franklin Pierce (now a museum) are in Concord. Mary Baker Eddy was born a few miles away, at Bow. 4 City (1970 pop 18,464), seat of Cabarrus co., central N.C., near the edge of the Piedmont, settled 1796, inc 1837. Located in a livestock and grain area, it is also a thriving cotton textile center. In addition to a great variety of cotton goods, its manufactures include foods and metal products. Gold discovered nearby in 1799 started the North Carolina gold rush. Concord is the seat of Barber-Scotia College.

Concord, river, c 15 mi (24 km) long, NE Mass., a short tributary of the Merrimack, which it joins at Lowell. On April 19, 1775, colonial militia fired some of the first shots of the American Revolution at the

British over a bridge across the river at Concord, Mass. Henry David THOREAU's first book, *A Week on the Concord and Merrimack Rivers* (1849), records a boat trip with his brother.

concordat (kōnkōrd'āt), formal agreement, specifically between the pope, in his spiritual capacity, and the temporal authority of a state. Its juridical status is now generally accepted as being a contract between CHURCH AND STATE and as such it is a treaty governed by international laws. The term *concordat* has also been applied to other agreements, thus, in the Swiss Confederation before 1848 federal decisions were called concordats. The fundamental antithesis between church and state found particularly violent expression in the quarrels over INVESTITURE during the Middle Ages and gave rise to the practice of concluding concordats. The earliest agreement to be called a concordat (see WORMS, CONCORDAT OF, 1122) was a dual proclamation rather than a bilateral act. The Concordat of 1516 between Pope Leo X and King Francis I of France, which abolished the Pragmatic Sanction of Bourges (see PRAGMATIC SANCTION), gave the king the right to nominate bishops, abbots, and priors but reserved to the pope the right of confirmation and special rights of appointment. That right was revoked at the States-General of Orléans in 1561, and the struggle between GALLICANISM and ULTRAMONTANISM was resumed, to last until the French Revolution. The CONCORDAT OF 1801, most famous of all concordats, regulated the status of the church in France for a century. In the 19th and 20th cent. numerous concordats were concluded. The appointment of bishops still remained an important issue, but the advance of secularism gave increasing importance to the status of religious education, monastic orders, and church property and to the seemingly conflicting loyalties of Roman Catholics to the state and to the church. In the Catholic countries of Latin America the conflicts and adjustments between church and state gave rise to a number of concordats. The concordat of 1855 with Austria gave vast rights to the church, but it was abrogated by Austria upon the proclamation of papal infallibility. The KULTURKAMPF between Otto von Bismarck and the papacy ended (1887) with a *modus vivendi*, which was a tentative agreement and not called a concordat. The status of the papacy in Italy was regulated in 1929 by the LATERAN TREATY. The threat of National Socialism (Nazism) to the Roman Catholic Church prompted the concordat of 1933 with Adolf Hitler, who violated it from the start. In Spain, where Francisco Franco had abrogated the concordat of 1931, a provisional agreement with the Vatican over the appointment of bishops was reached in 1941. After World War II a number of concordats (notably that with Poland) were abrogated by Communist regimes. A new concordat with Spain was signed in 1953.

Concordat of 1801, agreement between Napoleon Bonaparte and Pope Pius VII that reestablished the Roman Catholic Church in France. Napoleon, wishing to consolidate his position and to end the confusion in church affairs created by the French Revolution, took the initiative in negotiating the agreement. By its terms Roman Catholicism was recognized as the religion of most French citizens. Archbishops and bishops were to be nominated by the government, but the pope was to confer the office. Parish priests were to be appointed by the bishops, subject to government approval. Confiscated church property, most of which had been sold to private persons, was not to be restored, but the government was to provide adequate support for the clergy. To implement the concordat Napoleon issued (1802) the so-called Organic Articles, these restated the traditional liberties of the Gallican church (see GALLICANISM) while increasing Napoleon's control of church activities. The Organic Articles were not agreed to by the pope, and he did not consider them binding. A century later, anticlericalism, intensified by the Dreyfus Affair, led to the imposition of severe restrictions on the church by the government of Émile COMBES. Anticlericalism culminated in 1905 in the formal repudiation of the concordat, thereby separating CHURCH AND STATE. In Alsace and Lorraine, however, the Concordat of 1801 remained in force even after their recovery (1918) from Germany by France.

Concorde, Place de la (plās dā lā kōnkōrd'), large square, Paris, France. It is bounded by the Tuilleries gardens, the Champs Élysées, the Seine River, and a facade of buildings divided by a vista of the Madeleine Church. The Pont de la Concorde, a monumental bridge, leads from the Place to the other side of the Seine. The square was designed by Jacques Gabriel and built between 1755 and 1792. It was

originally planned as a monument to the then ruling Louis XV, whose statue stood in the center, and was called "Place Louis XV." In 1792 the statue was torn down, the square renamed "Place de la Révolution," and a guillotine set up, transforming the area into a site of mass executions. Under the Directory the name "Concorde" was adopted (although during the Bourbon restoration of 1815–30 "Place Louis XV" was revived). The central obelisk, a gift of the Egyptian viceroy, was erected in 1836. The fountains were constructed between 1836 and 1846.

Concordia (kōng-kōr'hyā), city (1970 pop 110,401), Entre Rios prov., NE Argentina, a port on the Uruguay River. One of the chief towns in the Argentine Mesopotamia, it exports preserved meat, mate, quebracho, and grain and is the distributing center of a farm and stock-raising district. Concordia was founded in 1832.

concrete, structural masonry material made by mixing broken stone or gravel with sand, cement (see CEMENT HYDRAULIC), and water and allowing the mixture to harden into a solid mass. The cement is the chemically active element, or matrix, the sand and stone are the inert elements, or aggregate. The use of artificial masonry similar to modern concrete dates from a remote period but did not become a standard technique of construction until the Romans adopted it (after the 2d cent. B.C.) for roads, immense buildings, and engineering works. The concrete of the Romans, formed by combining pozzolana (a volcanic earth) with lime, broken stones, bricks, and tuff, was easily available and had great durability (the Pantheon of Rome and the Baths of Caracalla were built with it). It proved suitable for temples, basilicas, the forum, and baths, enormous spaces could be roofed without lateral thrusts by vaults cast in the rigid homogeneous material. Concrete was unknown for centuries after the fall of Rome. Scientifically proportioned concrete formed with cement is an invention of modern times, the name not being used until c 1830. Modern portland cement has revolutionized the production and potentialities of concrete and has superseded the natural cements, to which it is vastly superior. Concrete used without strengthening is termed mass, or plain, concrete and has the structural properties of stone—great strength under compressive forces and almost none under tensile ones. F. Joseph Monier, a French inventor, found that tensile weakness could be overcome if steel rods were embedded in a concrete member. The new composite material was called reinforced concrete, or ferroconcrete. It was patented in 1857, and a private house in Port Chester, N.Y., first demonstrated (1857) its use in the United States. By the mid-20th cent. it had become a widely used structural material, rivaled only by steel. Reinforced concrete was improved by the development of prestressed concrete—concrete containing cables that are placed under tension before or after the concrete hardens. Another improvement, thin-shell construction, takes advantage of the inherent structural strength of certain geometric shapes, such as hemispherical and elliptical domes, in thin-shell construction great distances are spanned with very little material. The component materials of concrete are mixed in varying proportions, according to the strength required and the function to be fulfilled. The ideal mixture is that which solidifies with the minimum of voids, the mortar and small particles of aggregate filling all interstices. A typical proportioning is 1 2 5, i.e., one part of cement, two parts of sand, and five parts of broken stone or gravel, with the proper amount of water for a pouring consistency. For hardening into the required shape, the mixture is poured into wood or steel molds, called forms. Among the advantages of concrete as a building material are its adaptability to widely varied structural needs, its practically universal availability, its fire resistance, and the ease with which it can be used. The perfecting of reinforced concrete has profoundly influenced structural techniques and architectural forms throughout the world. See E. 5 de Mare, ed., *New Ways of Building* (3d ed 1958), A. A. Raafat, *Reinforced Concrete in Architecture* (1958), Peter Collins, *Concrete: The Vision of a New Architecture* (1959), A. M. Neville, *The Properties of Concrete* (1963), J. J. Waddell, *Concrete Construction Handbook* (1968).

concrete music: see ELECTRONIC MUSIC

concretion, mass or nodule of mineral matter, usually oval or nearly spherical in shape, and occurring in sedimentary rock. It is formed by the accumulation of mineral matter in the pore spaces of the sediment, usually around a fossil or fossil fragment acting as a nucleus. Most concretions are very dense.

and compact, and are usually composed of calcite, silica, or iron oxide. The material making up the concretion is believed to come from the surrounding rock, being redeposited around the nucleus. Concretions range in diameter from a fraction of an inch to many feet, although most are but a few inches in diameter. Perhaps the best known are the flint nodules found in chalk deposits such as those at Dover, England. Concretions having radiating cracks filled with mineral matter are called turtle stones, or septaria.

Condamine, La' see MONACO

Condé (kōNdā'), family name of a cadet branch of the French royal house of BOURBON. The name was first borne by **Louis I de Bourbon, prince de Condé**, 1530-69, Protestant leader and general. He fought the Spanish at Metz (1552) and Saint-Quentin (1557) but won little favor at court. After his conversion to Protestantism he became involved in the Conspiracy of Amboise (1560, see AMBOISE, CONSPIRACY OF) and escaped execution only through King Francis II's premature death. He was restored to favor by the regent, Catherine de' Medici, but took command of the Huguenots in the Wars of Religion (see RELIGION, WARS OF) and was captured at Dreux (1562). Released in 1563, he once more took up arms in 1567 and was killed at the battle of Jarnac. His son, **Henri I de Bourbon, prince de Condé**, 1552-88, was also a Huguenot general. **Henri II de Bourbon, prince de Condé**, 1588-1646, French political leader, son of Henri I, was forced to leave France (1609) because of the attentions paid his wife by King Henry IV. He returned in 1610 and in 1615 formed a conspiracy against Concino Concini, who dominated the government of the regent, MARIE DE' MEDICI, but he was bought off and later imprisoned (1616-19). Afterward he made his peace with the government, fought against the Protestants in the religious wars, and in 1643 became a member of the council of regency for King Louis XIV. His elder son, Louis II (see CONDÉ, LOUIS II DE BOURBON, PRINCE DE) was known as the Great Condé. Another son, Armand, founded the cadet branch of CONTI. Both sons and a daughter, Mme de LONGUEVILLE, were leaders in the FRONDE. Louis II's great-grandson, **Louis Joseph de Bourbon, prince de Condé**, 1736-1818, fought with distinction in the Seven Years War. At the beginning of the French Revolution he emigrated and fomented counterrevolutionary action. He formed a corps known as the army of Condé, which he allied with the Austrians. In 1797 he offered his services to Russia, in 1800 he entered English pay, but he was obliged to dissolve his army in 1801. He returned to France at the Restoration. His son, **Louis Henri Joseph de Bourbon, prince de Condé**, 1756-1830, followed his father into exile, fought in his army, and headed an unsuccessful revolt in the Vendée during the Hundred Days. He died, probably by suicide. His son was the ill-fated Louis Antoine Henri de Bourbon-Condé, duc d'ENGHEN. See H. E. P. L. d'Aumale, *History of the Princes de Condé in the XVIIIth and XVIIIth Centuries* (1863-64, tr. 1872).

Condé, Louis II de Bourbon, prince de, 1621-86, French general, called the Great Condé, son of Henri II de Condé. Among his early victories in the Thirty Years War were those of Rocroi (1643), Freiburg (1644), Nordlingen (1645), and Lens (1648). In the series of outbreaks known as the FRONDE he was at first loyal to the court, but his later intrigues and ambitions caused his arrest in 1650. This precipitated the Fronde of the Princes against Cardinal MAZARIN, chief councillor of state during the regency of ANNE OF AUSTRIA. The nobles forced Mazarin to release Condé (1651), who became leader of the rebellious army of the princes and allied himself with Spain against France. After the disintegration of the Fronde and the return to power of Mazarin, Condé was (1653-58) commander of Spanish forces against France. In the final stage of the war he was defeated (1658) in the Battle of the Dunes (see DUNES, BATTLE OF THE). After the Peace of the Pyrenees (1659) between France and Spain, he was pardoned and returned to court. He fought in the Dutch War for King Louis XIV, defeating William of Orange at Senef (1674) and forcing Raimondo Montecuccoli to retreat from the Rhine (1675). His last years were spent in retirement at Chantilly. See Walter FitzPatrick, *The Great Condé* (1873).

condensation, in physics, change of a substance from the gaseous (vapor) to the liquid state (see STATES OF MATTER). Condensation is the reverse of VAPORIZATION, or change from liquid to gas. It can be brought about by cooling, as in DISTILLATION, or by an increase in pressure due to a decrease in volume. Certain natural phenomena, such as dew, fog,

mist, and clouds, are the result of the condensation of water vapor in the atmosphere, the formation of DEW illustrates well the fundamental principles involved in such phenomena. The explanation of condensation can be found in the KINETIC-MOLECULAR THEORY OF GASES. As heat is removed from a gas, the molecules of the gas move more slowly, and as a result, the INTERMOLECULAR FORCES are strong enough to pull the molecules together to form droplets of liquid. Similarly, reducing the volume of the gas reduces the average distance between molecules and thus favors the intermolecular forces tending to pull them together.

condensed milk: see MILK

condenser, in electricity, obsolete term for CAPACITOR. The part of a DISTILLATION apparatus or other apparatus that causes the CONDENSATION of a gas is also called a condenser.

Condillac, Étienne Bonnot de (ätyēn' bōnō' də kōNdēyak'), 1715-80, French philosopher who developed the theory of sensationalism (i.e., that all knowledge comes from the senses and that there are no innate ideas). He took holy orders, and in 1768 he became a member of the French Academy of Sciences. His major works were *Essai sur l'origine des connaissances humaines* (1746) and *Traité des sensations* (1754). In these he tried to simplify Locke's theory of knowledge by arguing that all conscious experience is simply the result of passive sensations. In spite of this reduction of consciousness to the passive reception of sensation he nevertheless retained the Cartesian dualism of soul and body. He thus attempted to harmonize his deterministic psychology with his religious profession. See Z. Q. Schaupp, *The Naturalism of Condillac* (1926), I. F. Knight, *The Geometric Spirit* (1968).

conditioning: see LEARNING

condor, common name for certain American vultures, found in the high peaks of the Andes of South America and the Coast Range of S. California. Condors are the largest of the living birds, nearly 50 in (125 cm) long with a wingspread of from 9 to 10 ft (274-300 cm). Voracious eaters, they prefer carrion but will attack living animals as large as deer. Two eggs are laid in a sketchy cliff nest of twigs, the young are unable to fly until they are about a year old. The Andean condor, *Vultur gryphus*, has black plumage with white wing patches and a white neck ruff. The lead-colored head and neck are bare, the male has a comb and wattles. The rare California condor, or California vulture, *Gymnogyps californianus*, is all black with white wing bands. Condors, particularly the California species, are extremely rare and on the verge of extinction. The California condor only lays one egg and does not breed until at least six years old. Condors are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Falconiformes, family Cathartidae.

Condorcet, Marie Jean Antoine Nicolas Caritat, marquis de (maré' zhaN' anTwan' nēkōla' karēta' marké' də kōNdōrsā'), 1743-94, French mathematician, philosopher, and political leader, educated at Rheims and Paris. He became a member of the Academy of Sciences in 1769 and of the French Academy in 1782. His work on the theory of probability (1785) was a valuable contribution to mathematics. Condorcet took part in the Revolution, but, opposing the extremes of the Jacobins, he was condemned and died in prison. His best-known work is *Esquisse d'un tableau historique des progrès de l'esprit humain* (1795, tr. *Sketch for a Historical Picture of the Progress of the Human Mind*, 1955). In that work Condorcet traced human development through nine epochs to the French Revolution and predicted in the 10th epoch the ultimate perfection of man. See studies by A. E. Burlingame (1930) and J. S. Schapiro (1934, repr. 1963).

condottiere (kōndōt-tyā'rā) [Ital., = leader], leader of mercenary soldiers in Italy in the 14th and 15th cent., when wars were almost incessant there. The condottieri hired and paid the bands who fought under them. They dealt directly with the cities or states that requested their services and were responsible solely to them. They fought for the highest bidder, passing easily from one lord to another, this game proved dangerous and even fatal to more than one. Some condottieri had small states of their own, either inherited or acquired. The most famous were the Attendolosi (founders of the SFORZA family), COLLEONI, CARMAGNOLA, and Sir John de HAWKWOOD. See studies by J. J. Deiss (1966) and Geoffrey Trease (1971).

conducting, in music, the art of unifying the efforts of a number of musicians simultaneously engaged in musical performance. In the Middle Ages and

Renaissance the conductor was primarily a time beater, maintaining the measure or *tactus* of polyphonic music with his hand or a roll of music paper. During the baroque era the harpsichordist, playing the *basso continuo*, was the conductor. When the *continuo* disappeared, the first violinist, even today called concertmaster, became the leader or shared the function with a keyboard player. A few 18th-century conductors, such as Johann STAMITZ (1717-57) of the Mannheim orchestra, achieved a high standard of performance. The custom of beating time with a stick (baton) on a music stand or table originated in France. This noisy practice was irritating to the listener. It actually caused the death of the composer LULLY who struck his own foot with his baton, resulting in an abscess that killed him. The beating technique was altered and a more subtle manner was used by Beethoven, Mendelssohn, and Spohr. In his classic treatise *Über das Dirigieren* [concerning directing], Wagner laid down the principles of modern conducting, and under his influence Hans von BÜLOW became the first of the virtuoso conductors. A generally conventional set of gestures is used for beating time, a downstroke marking the beginning of a measure. The baton remains popular although a few conductors, notably STOKOWSKI, prefer not to use it. Modern conducting is highly individual and requires great musical understanding, a thorough knowledge of instruments and of the concert repertoire, a clear mastery of the baton and hand gestures, and a human sympathy for the performers. See Hermann Scherchen, *Handbook of Conducting* (tr. 1933), A. C. Boult, *A Handbook on the Technique of Conducting* (7th ed. 1951), Carl Bamberg, *The Conductor's Art* (1965), H. C. Schonberg, *The Great Conductors* (1967).

conduction, transfer of HEAT or ELECTRICITY through a substance, resulting from a difference in TEMPERATURE between different parts of the substance, in the case of heat, or from a difference in electric POTENTIAL, in the case of electricity. Since heat is ENERGY associated with the motions of the particles making up the substance, it is transferred by such motions, shifting from regions of higher temperature, where the particles are more energetic, to regions of lower temperature. The rate of heat flow between two regions is proportional to the temperature difference between them and the heat conductivity of the substance. In solids, the molecules themselves are bound and contribute to conduction of heat mainly by vibrating against neighboring molecules, a more important mechanism, however, is the migration of energetic free electrons through the solid. Metals, which have a high free-electron density, are good conductors of heat, while nonmetals, such as wood or glass, have few free electrons and do not conduct as well. Especially poor conductors, such as asbestos, are used as insulators to impede heat flow (see INSULATION). Liquids and gases have their molecules farther apart and are generally poor conductors of heat. Conduction of electricity consists of the flow of CHARGES as a result of an electromotive force, or potential difference. The rate of flow, i.e., the electric current, is proportional to the potential difference and to the electrical conductivity of the substance, which in turn depends on the nature of the substance, its cross-sectional area, and its temperature. In solids, electric current consists of a flow of electrons, as in the case of heat conduction, metals are better conductors of electricity because of their greater free-electron density, while nonmetals, such as rubber, are poor conductors and may be used as electrical insulators, or DIELECTRICS. Increasing the cross-sectional area of a given conductor will increase the current because more electrons will be available for conduction. Increasing the temperature will inhibit conduction in a metal because the increased thermal motions of the electrons will tend to interfere with their regular flow in an electric current, in a nonmetal, however, an increase in temperature improves conduction because it frees more electrons. In liquids and gases, current consists not only in the flow of electrons but also in that of ions. A highly ionized liquid solution, e.g., salt water, is a good conductor. Gases at high temperatures tend to become ionized and thus become good conductors (see PLASMA), although at ordinary temperatures they tend to be poor conductors. See ELECTROCHEMISTRY, ELECTROLYSIS, SUPERCONDUCTIVITY.

conductus: see MOTET

cone or **strobilus** (strōb'ālas), in botany, reproductive organ of the gymnosperms (the conifers, cycads, and ginkgos). Like the flower in the angiosperms (flowering plants), the cone is actually a highly modified branch, unlike the flower, it does

not have sepals or petals. Usually separate male (staminate, or pollen) cones and female (ovulate, or seed) cones are borne on the same plant. Each of the numerous scales, or sporophylls, of the staminate cone bears POLLEN-producing anthers and each female-cone scale bears ovules in which egg cells are produced. In the pine, a typical conifer, the staminate cones are small and short-lived, they are borne in clusters at the top of the tree. At the time of pollination, enormous numbers of pollen grains are released, those that land accidentally on female-cone scales extend pollen tubes part way into the ovule during one growing season but usually do not reach the stage of actual fertilization until the next year. The cones that are commonly observed are the seed cones, which are normally hard and woody although in a few the scales are fleshy at maturity. The terms *strobili* and cones are also applied to the comparable structures of the horsetails and club mosses.

cone or **conical surface**, in mathematics, surface generated by a moving line (the generator) that passes through a given fixed point (the vertex) and continually intersects a given fixed curve (the directrix). The generator creates two conical surfaces—one above and one below the vertex—called nappes. If the directing curve is a CONIC SECTION (e.g., a circle or ellipse) the cone is called a quadric

Cone

cone. The commonest type of cone is the right circular cone, a quadric cone in which the directrix is a circle and the line drawn from the vertex to the center of the circle is perpendicular to the circle. The generator of a cone in any of its positions is called an element. The solid bounded by a conical surface and a plane (the base) whose intersection with the conical surface is a closed curve is also called a cone. The altitude of a cone is the perpendicular distance from its vertex to its base. The lateral area is the area of its conical surface. The volume is equal to one third the product of the altitude and the area of the base. The frustum of a cone is the portion of the cone between the base and a plane parallel to the base of the cone cutting the cone in two parts.

coneflower, name for several American wild flowers of the family Compositae (COMPOSITE family). The purple coneflowers (genus *Echinacea*) are found E of the Rockies. They are sometimes grown as garden plants, as are the similar yellow coneflowers, or rudbeckias (see BLACK-EYED SUSAN). Coneflowers are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Compositae.

Conegliano, Cima da see CIMA GIOVANNI BATTISTA

Conemaugh (kōn'əmə'), river c 70 mi (110 km) long, rising in the Allegheny Mts and flowing NW to the Allegheny River, SW Pa. Federal flood-control works on the river and its tributaries include Conemaugh River Dam (160 ft/49 m high, 1,265 ft/386 m long, completed 1952).

Conestoga Indians (kōnəstō'gə), North American Indians of the Iroquoian branch of the Hoka-Siouan linguistic stock (see AMERICAN INDIAN LANGUAGES). In the 17th cent they lived on the lower reaches of the Susquehanna River and about the head of Chesapeake Bay, and they were sometimes called Susquehannocks. From this area they were driven southward and westward by attacks from the Iroquois Confederacy. The few survivors of this warfare were massacred by whites inflamed by accounts of the Indian War then raging (1763) along the Pennsylvania frontier.

Conestoga wagon, heavy freight-carrying vehicle of distinctive type that originated in the Conestoga region of Pennsylvania c 1725. It was used by the farmers to carry heavy loads long distances before there were railroads to convey produce to markets. Later it was used to carry manufactured goods across the Alleghenies to frontier stores and settlements and to bring back the frontier produce. This means of transporting goods by WAGON TRAIN developed into a major business employing thousands of wagons before the railroads crossed the mountains c 1850. The larger Conestoga wagons, usually drawn by six horses, carried loads up to eight tons. The bottom of the wagon box was curved, rising at both ends, so that in going up and down hills the goods would shift less easily and the tailgate would be subjected to less strain. The same curve was carried out in the white hood, at first made of hempen homespun and later of canvas, which rose up and out at each end, covering the front and rear openings with a poke bonnet effect to keep out sun, rain, and dust. The wagons were striking and graceful vehicles as they moved over the hills and were often called "ships of inland commerce." An arch of bells was fastened to the hames of each horse. The drivers usually rode the left wheel horse and are credited with originating the American custom of turning out to the right. The PRAIRIE SCHOONER was a modification of the Conestoga wagon. See study by G. Shumway and H. C. Frey (3d ed. 1968).

coney or **cony** (both kō'nē), name used for the RABBIT (*Oryctolagus*) and for its fur, more often, for the PIKA, a small rodent found at high altitudes in both hemispheres, and for the HYRAX, a small herbivorous, hoofed animal of Africa and SW Asia. The last is probably the coney referred to in the Bible (Ps 104:18, Prov 30:26).

Coney Island (kō'nē), beach resort and amusement center of S Brooklyn borough of New York City, SE NY, on the Atlantic Ocean. The tidal creek that once separated the island from the mainland has been filled in, making the area a peninsula. More than a million persons throng to Coney Island on hot weekends and holidays, attracted by the beach, the 2-mi (3.2-km) boardwalk, the New York Aquarium, and the many other entertainment devices, eating places, and souvenir stands. High-rise apartments have replaced much of the amusement area since the 1950s.

confectionery, delicacies or sweetmeats that have sugar as a principal ingredient, combined with coloring matter and flavoring and often with fruit or nuts. In the United States it is usually called candy, in Great Britain, sweets or boiled sweets. Sweetmeats, long known in the Orient and to the Egyptians, were at first preserved or candied fruits, probably made with honey. One of the earliest functions of candy was to disguise unpleasant medicine, and prior to the 14th cent confections were sold chiefly by physicians. Medieval physicians often used for this purpose sugarplum, a sweetmeat made of gum dragon, white sugar, and rosewater, beaten into a paste. One of the earliest confections still surviving is marzipan, known throughout Europe, it is made of almonds or other nuts, pounded to a paste and blended with sugar and white of egg. In the Middle Ages it was sometimes molded into fancy shapes and stamped with epigrams. Sugarplums made of boiled sugar, were known in England in the 17th cent, but it was not until the 19th cent that candy-making became extensive. The display of British boiled sweets at the national exhibition of 1851 stimulated manufacture in other countries, especially in France. In the United States in the middle of the 19th cent about 380 small factories were making lozenges, jujube paste, and stick candy, but most fine candy was imported. With the development of modern machinery and the increasing abundance of sugar, confectionery making became an important industry. In the early 1970s annual candy sales in the United States had reached around \$2 billion. Candy is roughly divided into two classes, hard and soft, the distinction is based on the fact that sugar when boiled passes through definite stages during the process of crystallization. Fondant, or sugar cooked to the soft stage, is the basis of most fancy candies, such as chocolate creams. See P. P. Gott, *All about Candy and Chocolate* (1958), 8. W. Minifie, *Chocolate, Cocoa and Confectionery* (1970).

Confederacy, name commonly given to the Confederate States of America (1861-65), the government established by the Southern states of the United States after their SECESSION from the Union. (For the events leading up to secession and for the military operations of the Confederacy in the con-

flict between North and South which followed, see CIVIL WAR.) South Carolina, the first Southern state to secede (Dec 20, 1860) after the election of the Republican President Abraham Lincoln, was soon followed out of the Union by six more states—Mississippi, Florida, Alabama, Georgia, Louisiana, and Texas. On Feb 4, 1861, delegates from these states (except the Texans, who were delayed) met at Montgomery, Ala., and organized a provisional government. The Convention passed over the radical secessionists, R. B. Rhett and W. L. Yancey, and elected (Feb 9) Jefferson DAVIS of Mississippi and Alexander H. STEPHENS of Georgia president and vice president respectively. The Convention also drafted a constitution (adopted on March 11) and functioned as a provisional legislature pending regular elections. The constitution closely resembled the Constitution of the United States, even repeating much of its language, but naturally had STATES' RIGHTS provisions. Slavery was "recognized and protected," but the importation of slaves "from any foreign country other than the slave-holding States or Territories of the United States of America" was prohibited. The general welfare clause of the old Constitution was omitted, protective tariffs were forbidden, and for most appropriations a two-thirds vote of congress was required. There were other, less important, departures from the US Constitution, e.g., the president and vice president were to be elected for six years, but the president was not "reeligible", members of the president's cabinet might not be granted seats in either house of the Confederate congress to discuss legislation affecting their departments, and amendment to the constitution (by two thirds of the states, with congress having no voice) was made easier. The new government seized or pressed its claims for US property within its domain, especially forts and arsenals, and, when the Union declined to surrender Fort Sumter, ordered the firing (April 12-13) that formally began the hostilities. Lincoln's immediate call for troops brought four more Southern states—Arkansas, North Carolina, Virginia, and Tennessee—into the Confederacy, which now comprised 11 states. The border slave states of Maryland, Kentucky, and Missouri remained in the Union although they contained many Southern sympathizers. Confederate state governments were established at Neosho, Mo., and Russellville, Ky., in opposition to the official governments. In May it was decided to transfer the capital from Montgomery to Richmond, Va., because of Virginia's prestige, that move, considering Richmond's proximity to the North, has generally been regarded as a serious mistake. The new constitution was ratified (the approval of only five states was needed), general elections for congress and for presidential electors (as under the Federal Constitution) were held in Nov., 1861, and on Washington's birthday in 1862, the "permanent" government was inaugurated at Richmond. Davis and Stephens had been chosen without opposition to head it. Judah P. BENJAMIN, successively attorney general, secretary of war, and secretary of state, was the most important figure in Davis's cabinet. Only two other men remained in the cabinet for its entire brief existence—Stephen R. MALLORY, secretary of the navy, and John H. REAGAN, postmaster general. The story of the Confederacy is essentially the story of the loss of the Civil War. Even with its early military triumphs, the Confederacy experienced trying days. It never won recognition as an independent government, although Southerners had been confident that "king cotton" would bring this about. In 1861 they instituted an embargo on the export of cotton and voluntarily limited cultivation of the staple on the theory that these self-imposed and unofficial restrictions would make a cotton-hungry England eager to acknowledge the new nation that could supply in abundance the most important raw material in Britain's industrial system. The British, however, were well provided with cotton from previous boom years, and when their stocks finally were depleted, other sources of supply became available. Furthermore, Lincoln's EMANCIPATION PROCLAMATION enhanced the Union cause in the eyes of the average Briton, and the British government, no matter how pro-Confederate some of its individual members were, was not disposed to fly in the face of popular opinion. The CONFEDERATE CRUISERS built or bought in England were a scourge to the US merchant marine, and later at the settlement of the ALABAMA CLAIMS, Great Britain was adjudged partly responsible for their depredations, but beyond this the Confederate missions of James M. MASON, John SLIDELL, William L. YANCEY, and others in Europe achieved little. Napoleon III would probably have

followed Britain in recognizing the Confederacy, but not even the Confederate offer to recognize the French-dominated government of Maximilian in Mexico could induce the emperor to go off on this diplomatic venture alone. On the other hand, both the British and French recognized the blockade of the South, which the Union had proclaimed at the beginning of the war. This was particularly galling to Southerners because at first the blockade was not very effective; it is estimated that not more than a tenth of the ships running the blockade in 1861 were captured. But as the war progressed the blockade became more effective, and by 1865 one of every two blockade runners was being taken. When, in Oct., 1863, Davis expelled the British consuls who had remained in the South, the Confederacy had resigned itself to European nonrecognition, which was mostly influenced by the rising tide of Union successes in the war. The Confederate army early found that volunteers alone were insufficient, and the first conscription law was passed in April, 1862. By a later act (Feb., 1864), white men within the ages of 17 and 50 were drafted into military service. Provisions permitting the hiring of substitutes and exempting one owner or overseer for each 20 Negroes were highly unpopular among the yeomanry, who grumbled about "a rich man's war and a poor man's fight." Joseph E. BROWN and Zebulon B. VANCE, the governors of Georgia and North Carolina, led the denunciation of conscription and further berated Davis for the assumption of state troops into the Confederate army, the suspension of the writ of *habeas corpus*, and the Confederate tax program. Their extreme states' rights views represented a logical development of the theory that had led the Southern states to secede, but their insistence on maintaining these views at a time when unity was imperative was an added factor in the Confederate defeat. The fact that Brown, Vance, and others like them were able men and no less set on victory than was Davis only emphasizes this glaring deficiency in the nature of the Confederacy. Moreover, from the very beginning, the Confederacy was in bad financial condition, lacking in both specie and banks. It had difficulty in negotiating loans and was forced to finance its operations through issues of paper money, which by 1864 reached \$1 billion in face value, more than twice that of the greenbacks issued by the Union. The gold value of these notes declined dangerously. Christopher G. MEMMINGER, secretary of the treasury, was forced to resign in 1864, but the situation was beyond the abilities of any man. With the men at war, the women of the Confederacy carried on at home. They did not face wholesale death as did the soldiers in the field, yet they knew war, it was brought to them in the mighty Union invasion of 1864-65. Feeling the pinch of the Union blockade and already lacking the bare necessities of life—shoes, iron goods, paper, clothing—because the South was nonindustrial (the armies were kept supplied with ammunition, but beyond that industry was negligible), they now saw their country devastated by Union forces such as those led by Sherman and Sheridan. Many, both men and women, cried for peace, but the Union price was too great (see HAMPTON ROADS PEACE CONFERENCE) and most Southerners hung on grimly. Benjamin's proposal that Negroes who willingly enlisted in the fight be freed indicates how desperate affairs became before the Confederacy collapsed. That the Confederacy was able to continue the war as long as it did is a tribute to its stout soldiers and a few brilliant commanders, notably Robert E. Lee. For the South, less populous than the North and largely made up of scattered agricultural communities, defeat was inevitable. The heroic aspect of the South's struggle was tarnished by its retention and defense of the institution of slavery, yet it long revered the "lost cause" of the Confederacy as its greatest tradition. See Jefferson Davis, *The Rise and Fall of the Confederate Government* (1881, abr. ed. 1961), F. L. Owsley, *King Cotton Diplomacy* (1931, new ed. 1959), R. S. Henry, *The Story of the Confederacy* (1931, rev. ed. 1957), C. H. Wesley, *The Collapse of the Confederacy* (1937, repr. 1968), J. G. Randall, *The Civil War and Reconstruction* (1937, rev. ed. by David Donald, 1961), E. M. Coulter, *The Confederate States of America, 1861-1865* ("A History of the South" series, Vol. VII, 1950), Clement Eaton, *A History of the Southern Confederacy* (1954), M. W. Wellman, *They Took Their Stand: The Founders of the Confederacy* (1959), W. B. Years, *The Confederate Congress* (1960), C. P. Roland, *The Confederacy* (1960), H. S. Commager, *The Defeat of the Confederacy* (1964), E. M. Thomas, *The Confederacy as a Revolutionary Experience* (1971).

Confederate cruisers, in U.S. history, warships constituting the South's seagoing navy. At the outbreak of the Civil War the United States ranked next to Great Britain in merchant marine. Since almost all of the tonnage belonged to the North, the Confederacy set out to destroy it. Privateering flourished only briefly because the increased effectiveness of the Union blockade forestalled attempts to bring prizes into Southern ports for adjudication. But in the course of the war some 18 cruisers, known as Confederate cruisers, were engaged in this activity. Only eight achieved results of any consequences. Of these, the *Florida*, the *Alabama*, and the *Shenandoah* were outstanding. The *Florida*, built in Liverpool in 1861-62, began her active career in Jan., 1863. Commanded by John N. Maffitt and later by Charles M. Morris, the *Florida*, along with several of her captures that were in turn commissioned Confederate cruisers, took about 60 prizes. She was captured by the U.S.S. *Wachusett* in the harbor of Bahia, Brazil, in Oct., 1864. The most famous of the cruisers was the *Alabama*, also built at Liverpool in 1861-62. Under the command of Raphael Semmes she took almost 70 prizes. Her damage to U.S. shipping was valued at more than \$6 million in the settlement of the ALABAMA CLAIMS. In a famous naval action off Cherbourg, France, on June 19, 1864, the *Alabama* was sunk by the U.S.S. *Kearsarge*. The *Shenandoah*, bought at London in 1864, was commanded by James I. Waddell. Many of her 38 prizes, principally Pacific whalers, were taken after the fall of the Confederacy, of which Waddell was not apprised until Aug., 1865. On returning to England the *Shenandoah* reverted to the United States. The indirect damage inflicted on the U.S. carrying trade by the cruisers had far more effect than the direct losses they caused. Insurance rates rose, and hundreds of ships transferred to foreign flags, especially to Great Britain's. The raiders were in good part responsible for the decline of the nation's merchant marine. See G. W. Dalzell, *The Flight from the Flag* (1940), Murray Morgan, *Dixie Raider* (1948), Edward Boykin, *Ghost Ship of the Confederacy* (1957), W. N. Still, Jr., *Iron Afloat* (1971).

Confederate States of America see CONFEDERACY

Confederation, Articles of, in U.S. history, ratified in 1781 and superseded by the Constitution of the United States in 1789. The imperative need for unity among the new states created by the American Revolution and the necessity of defining the relative powers of the CONTINENTAL CONGRESS and the individual states led Congress to entrust the drafting of a Federal constitution to a committee headed by John Dickinson. In the Articles of Confederation submitted by the committee to the Second Continental Congress, on July 12, 1776, three points provoked much argument—the apportionment of taxes according to population, the granting of one vote to each state, and the right of the federal government to dispose of public lands in the West. After several revisions were made, however, this constitution, with a preamble and 13 articles, was adopted by Congress on Nov. 15, 1777. In their final form, the Articles retained the vote by states, but based the apportionment of taxes on the value of buildings and land, and specified that no state should be deprived of territory for the benefit of the United States. The preamble and Article 1 established a perpetual union of the Thirteen Colonies under the style of the United States of America. Article 2 asserted that each state retained its sovereignty and every right not expressly delegated to the central government, while Article 3 characterized the confederation as a "league of friendship," for common defense. In Article 4, the free inhabitants of each state were granted the privileges of free citizens in all the states, extradition was provided for, and it was stipulated that full faith and credit be given the records, acts, and judicial proceedings of the courts of one state in the courts of every other state. Article 5 provided that each state send annually not less than two nor more than seven delegates to Congress, though each state was to have only one vote. Article 6 left the conduct of war to Congress, and Article 7 empowered the state legislatures to appoint military officers up to and including the rank of colonel. Article 8 provided that the charges of war and other expenses incurred for the common defense should be defrayed out of a common treasury. Besides placing the conduct of foreign affairs in the hands of Congress, Article 9 authorized a system of settling disputes between states, granted Congress partial control over the currency, sanctioned the establishment of post offices by Congress, and established the Committee of the States,

with one delegate from each state, to sit in recess of Congress. The authority of the central government was drastically restricted by this article, which forbade Congress to engage in war, negotiate treaties or alliances, coin money, emit bills of credit, or borrow and appropriate money without obtaining the consent of a majority of the states. Provisions for the functioning of the Committee of the States and for the possible admission of Canada were made in Articles 10 and 11. Article 12 stated that pecuniary obligations of Congress were to be deemed a charge against the United States. Article 13 stipulated that the Articles of Confederation were to be unanimously ratified by the states before going into effect and that no alteration could be made unless agreed to both by Congress and by the legislature of every state. By 1779 all the states had ratified the Articles except Maryland, which refused its assent until states claiming territory NW of the Ohio River relinquished their claims, thus guaranteeing the equitable right of all states to the Western lands. When New York, followed by Virginia and Connecticut, offered to cede to Congress its claims to Western territory, Maryland ratified (March 1, 1781) the articles. While this constitution was a contribution to the techniques of government and a step toward national unity, most American historians hold that the Articles of Confederation proved wholly unsatisfactory because of the subordinate position occupied by the central government. Congress, dependent upon the states for its funds and for the execution of its decrees, became a legislative-executive body attempting to reconcile the policies of the various states. It could not extend its jurisdiction to individuals, command respect abroad by stabilizing credit, unify foreign and domestic policies, pass navigation regulations, or enforce treaty obligations. Because of its inherent weaknesses, the government commanded little respect, and its prestige was further diminished by its inability to cope with internal uprisings such as Shays's Rebellion. Many capable statesmen who held key posts—e.g., Robert Morris, John Jay, and Benjamin Lincoln—were thwarted by this organization of government, while others, equally able, shunned Congress in favor of state politics. The unanimity rule enabled one state to prevent the passage of a measure desired by 12 states. Thus, New York alone blocked the establishment of a vitally important tariff. When it became apparent that government under the Articles of Confederation was, in the words of George Washington, "little more than the shadow without the substance," agitation for a stronger Federal government began. This agitation resulted in the Annapolis Convention of 1786 and the FEDERAL CONSTITUTIONAL CONVENTION of 1787, which drafted the Constitution of the United States. Perhaps the most significant event of the Confederation period was the adoption of the Ordinance of 1787 concerning the Northwest Territory. See Allan Nevins, *The American States during and after the Revolution, 1775-1789* (1924, repr. 1971). A more favorable view of the Articles of Confederation is given in the scholarly studies of Merrill Jensen, *The Articles of Confederation* (1940, repr. 1963) and *The New Nation* (1950, repr. 1962). See also study by S. A. Pleasants III (1968).

Confederation of the Rhine, league of German states formed by Emperor Napoleon I in 1806 after his defeat of the Austrians at AUSTERLITZ. Among its members were the newly created kingdoms of Bavaria and Württemberg (see PRESSBURG, TREATY OF), the grand duchies of Baden, Hesse-Darmstadt, and Berg, and a number of other principalities. Eventually nearly all the German states except Austria and Prussia joined the confederation. The members disavowed their allegiance to the Holy Roman Empire, and Francis II, already styled emperor of Austria, relinquished the title Holy Roman emperor in 1806. Napoleon attempted to influence the internal as well as the foreign affairs of the confederation, but recurring international crises diverted his efforts. After Napoleon's retreat from Russia (1812-13), its members, by changing sides in the war, caused the collapse of the confederation.

Confessing Church, Ger. *Bekennende Kirche*, German Protestant movement. It was founded in 1933 by Martin NIEMÖLLER as the Pastors' Emergency League and was systematically opposed to the Nazi-sponsored German Christian Church. The immediate occasion for the opposition was the attempt by the Nazis soon after their rise to power to purge the German Evangelical Church of converted Jews and to make the church subservient to the state. At the Synod of Barmen (May, 1934) the Confessing Church set up an administration and proclaimed itself the true Protestant Church in Germany. After

the arrest of many of its ministers the church was forced underground. Eventually the more moderate Lutheran Council replaced it as the most effective opponent to the Nazi regime. After the war Niemöller and his followers continued as a separate group within the German Evangelical Church. The group is governed by representatives from each territorial church (the Council of Brethren) and its doctrines are based on the Barmen declaration and the Reformation creeds. See A. C. Cochrane, *The Church's Confession under Hitler* (1962).

confession, in law, formal admission of criminal guilt. It is usually obtained in the course of examination by the police or prosecutor or at the trial. For a confession to be admissible against an accused it must have been procured voluntarily after the person was told of his rights (see *MIRANDA VS ARIZONA*). If a confession is obtained by torture or by a false promise of immunity from prosecution made by a responsible party, it is inadmissible. A signed confession is *prima facie* voluntary, and the accused must introduce proof that it was extorted if he wishes to prevent its introduction at the trial. Usually a person who does not plead guilty may not be convicted solely on the basis of his confession.

confessional literature derives from a central ritual of the Christian faith, confession of one's sins. The *Confessions* of St. Augustine, an autobiographical account of Augustine's struggle against the pagan world view of his times (4th–5th cent. A.D.), and his ultimate conversion to Christianity, is the first important example of confessional literature—"I sinned when as a boy I preferred those empty to those more profitable studies 'One and one, two, two and two, four,' this was to me a hateful song 'the wooden horse lined with armed men' and 'the burning of Troy' were the choice spectacle of my vanity." Probably the best modern example of religious confessions is Thomas Merton's *The Seven Storey Mountain* (1948). Not all confessional literature is religious. Jean-Jacques Rousseau's *Confessions* (1781) reveal the author as he is, not as he ought to be. "Two almost incompatible things are united in me, how I don't know, a very ardent temperament and ideas slow to burn. It might be said that my heart and my mind do not belong to the same individual." Thomas De Quincey's *Confessions of an English Opium Eater* (1822) and F. Scott Fitzgerald's *The Crack-Up* (1936) follow this tradition. The intimate, autobiographical poetry of poets like Robert Lowell, Sylvia Plath, and Anne Sexton has been termed "confessional poetry." Confessional literature is not always autobiographical. Such novels as Chateaubriand's *Memoirs d'outre-tombe* (1849), Dostoyevsky's *Notes From The Underground* (1864), André Gide's *L'immoraliste* (1930), Saul Bellow's *Herzog* (1964), and Philip Roth's *Portnoy's Complaint* (1969) are the confessions of fictional narrators whose sins may or may not resemble those of their creators.

Confession of Augsburg: see CREED 4.

confessions of faith, Protestant: see CREED 4, 5, 6.

confirmation, Christian rite in which the initiation into the church that takes place by BAPTISM is confirmed. In the Roman Catholic and Orthodox Eastern churches, it is a SACRAMENT by which a Christian is strengthened in his faith. In the Lutheran and Anglican churches it is universally used, but it is not a sacrament (except among High Anglicans). In the East it is conferred by the priest on the newly baptized person of whatever age. In the West it is ordinarily an episcopal function, and the recipient has reached a canonical age of discretion. Confirmation consists of the laying on of hands and anointing with chrism, a mixture of oil and balm. Anglicans and Lutherans have abandoned the anointing. Some other Protestant churches use the term confirmation for the ceremony of admitting baptized persons into full church membership. Scriptural passages cited as authority for confirmation include Acts 8:14–17, 19.

conflict of laws, that part of the law in each state, country, or other jurisdiction that determines whether, in dealing with a particular legal situation, the law of some other jurisdiction will be recognized or given effect. An alternative term, widely used in Europe, is "private international law." An example of a situation that might involve the different laws of two places is that of a contract signed in one state and mailed to another. Complications may arise if one of the states provides that a contract so delivered is effective once mailed, while the other state provides that it is not effective until received. The rules of conflicts of law that a court applies in these disputed situations are commonly designed to

decide the case by the law of the territory having the closest connection with the transaction. An often expressed ideal is that of making the decision the same regardless of where the case is decided. In the United States the existence of many states with legal rules often at variance makes the subject of conflict of laws especially urgent. The Supreme Court ruled in 1938 that each Federal court must apply the conflict of laws rules of the state in which it sits. Certain provisions of the U.S. Constitution deprive the states of complete freedom to determine how they will decide cases in this field. Most important is Article 4, Section 1, which provides, in part, "Full Faith and Credit shall be given in each State to the Public Acts, Records, and judicial Proceedings of every other State." The U.S. Supreme Court has interpreted this provision as requiring each state to treat as valid any judgment rendered by another state that had jurisdiction and to lend its powers of enforcement to the judgment, the sole exception is that the courts of one state do not enforce claims arising under the penal law of another (see EXTRADITION). Jurisdiction in this context is defined as the capacity of the state to interpose its authority in a transaction because of intimate connection with it. There are especially difficult jurisdictional problems in the field of divorce. The chief problem occurs when only one of the parties appears and the other is merely notified of the action. In such cases the Supreme Court has ruled that the state had jurisdiction to divorce if the party appearing was domiciled there. The court has defined DOMICILE as the place where a person is living with the ultimate intention of making it his home. A person who obtains a divorce under these circumstances may claim alimony in any state and is immune from the charge of bigamy if there is a remarriage. The most important attempt in antiquity to deal with the problem of conflict of laws was the *jus gentium* [law of nations] of the Romans: a system of laws applied to all free foreigners. The founder of the modern study of conflict of laws was the medieval jurist, Bartolus of Sassoferrato (1314–57). See W. W. Cook, *The Logical and Legal Basis of the Conflict of Laws* (1942), P. C. Jessup, *Transnational Law* (1956), S. A. Bayart, *Conflict of Laws* (1968).

Confraternity of Christian Doctrine: see BIBLE.

Confucianism (kənfyōō'shənizəm), moral and religious system of China. Its origins go back to the *Analects* (see CHINESE LITERATURE), the sayings attributed to CONFUCIUS, and to ancient commentaries, including that of MENCIUS. In its early form (before the 3d cent. B.C.) Confucianism was entirely a system of ethical precepts for the proper management of society. It envisaged man as essentially a social creature who is bound to his fellows by *jen*, a term often rendered as "sympathy," or "human-heartedness." *Jen* is expressed through the five relations—sovereign and subject, parent and child, elder and younger brother, husband and wife, and friend and friend. Of these, the filial relation is usually stressed. The relations are made to function smoothly by an exact adherence to *li*, a term denoting a combination of etiquette and ritual. In at least some of these relations a person may be superior to some and inferior to others. If in his subordinate status he wishes to be properly treated he must—applying a principle similar to the Golden Rule—treat his own inferiors with propriety. Correct conduct, however, proceeds not through compulsion, but through a sense of virtue inculcated by observing suitable models of deportment. The ruler, as the moral exemplar of the whole state, must be irreproachable, but a strong obligation to be virtuous rests upon all men. It was recognized by the early philosophers that the millennial "great commonwealth," the union of mankind under ethical rule, would take a long time to achieve. It might be constantly advanced, however, by practicing the "rectification of names." This is a critical examination of the degree to which the behavior of a functionary or an institution corresponds to its name, thus, the title of king should not be applied to one who exacts excessive taxes, and the criticism of the undeserving claimant should force him to reform. In the 1st cent. A.D. began the practice of offering sacrifices and other veneration to Confucius in special shrines, it continued into the 20th cent. Confucianism had often to contend with supernatural religious systems, notably TAOISM and BUDDHISM, and at times, especially from the 3d to the 7th cent., it suffered a virtual eclipse. Under the T'ang dynasty (618–906) it enjoyed a renaissance and was the state religion. In the Sung dynasty (960–1279) occurred the development of neo-Confucianism. Neo-Confucian thinkers for-

mulated a system of metaphysics (which was not a part of older Confucianism), drawing on Taoist and Buddhist ideas, they were particularly influenced by ZEN BUDDHISM. Nevertheless they did not accept the Taoist search for immortality or the otherworldly ideals of Buddhism, remaining faithful to the practical and socially concerned Confucian spirit. The neo-Confucian eclecticism was unified and established as an orthodoxy by Chu Hsi (1130–1200), and his system dominated subsequent Chinese intellectual life. His metaphysics is based on the concepts of *li*, or principle of form in manifold things, and the totality of these, called the "supreme ultimate" (*t'ai chi*). During the Ming dynasty, the idealist school of Wang Yang-ming (1472–1529) put a stress on meditation and intuitive knowledge. The overthrow (1911–12) of the monarchy, with which Confucianism had been closely identified, led to the disintegration of Confucian institutions and a decline in Confucian traditions, a process accelerated after the Communist revolution (1949). See Richard Wilhelm, *Confucius and Confucianism* (tr. 1931, repr. 1970), J. C. Shryock, *The Origin and Development of the State Cult of Confucius* (1932, repr. 1966), Lin Yutang, *The Wisdom of Confucius* (1943), H. G. Creel, *Confucius The Man and the Myth* (1949, repr. 1972), Liu Wu-chi, *Confucius His Life and Time* (1955, repr. 1972), Shigeki Kaizuka, *Confucius* (tr. 1956), F. C. Hsu, *Confucianism* (1966), D. H. Smith, *Confucius* (1973).

Confucius (kənfyōō'shās), Chinese K'ung Fu-tse, c. 551–479? B.C., Chinese sage. Positive evidence concerning the life of Confucius is scanty. Modern scholars base their accounts largely on the *Analects*, a collection of sayings and short dialogues apparently collected by Confucius's disciples, and discard most of the later legends. Confucius was born in the feudal state of Lu, in modern Shantung prov. Distressed by the constant warfare between the Chinese states and by the venality and tyranny of the rulers, he urged a system of morality and statecraft that would preserve peace and afford the people the stable, just government they required. He gathered about him a number of disciples, some of whom occupied high positions, although Confucius himself, possibly because of his extremely outspoken manner toward his superiors, was at most granted an insignificant sinecure. From about his 55th to his 65th year he toured several neighboring states, but he was still unable to induce any ruler to grant him high office so that he might introduce his reforms. Later tradition depicts Confucius as a man who, seeking to restore an older social order, made special study of ancient books. It was said that he was a minister of state and the author (or at least the editor) of the *Wu Ching* [five classics] (see CHINESE LITERATURE). His supposed doctrines are embodied in Confucianism. For bibliography, see CONFUCIANISM.

congenital heart disease, any defect in the HEART present at birth. There is evidence that some congenital heart defects are inherited. However, most commonly, the defect is caused by environmental conditions in the uterus like the presence of certain drugs or viruses that reach the fetus via the maternal circulation, e.g., infection of the mother with rubella (German measles) virus during the first trimester of pregnancy causes a high rate of congenital heart lesions and other malformations. Among the most common congenital heart disorders are malformations in the valves and the persistence of structures that are normally closed off at birth, i.e., the ductus arteriosus (fetal blood vessel that shunts blood from the pulmonary vein to the aorta, bypassing the heart) and the foramen ovale (opening between the left and right atria of the fetal heart). If the malformation is severe, it will produce various symptoms of insufficient heart function, such as cyanosis (bluish tinge to the skin), dyspnea (difficulty in breathing), fatigue, and abnormal heartbeat, valvular deformities predispose the patient to bacterial infection of the endocardium (see ENDOCARDITIS). Less severe malformations may not produce noticeable symptoms until later in life, and some may not require any medical attention. Many congenital heart defects that are debilitating can now be corrected surgically. Other congenital anomalies, such as mongolism, are present in about 20% of cases of congenital heart disease.

congestive heart failure, inability of the heart to expel sufficient blood to keep pace with the metabolic demands of the body. In the healthy individual the heart can tolerate large increases of workload for a considerable length of time. Cardiac failure results from conditions, e.g., coronary, hypertensive, and rheumatic heart disease, that interfere with the nutrition and oxygenation of the heart.

muscle itself. Congestive heart failure develops in 50% to 60% of patients with such disorders, and it can be either acute or chronic. If the heart has time to compensate the heart muscle may become hypertrophic (enlarged). Eventually the great demand for oxygen by the heart muscle cells cannot be met, and cell death results. Either the left or right ventricle alone may fail first, although combined failure is most common and almost always eventually occurs. Left ventricular failure is marked by shortness of breath (dyspnea), often accompanied by cough, pulmonary congestion and edema are evident. Failure of the right ventricle produces systemic edema, reflecting hepatic and visceral engorgement. Treatment of cardiac failure usually includes long-term restrictions on diet and activity. Digitalis is often prescribed to increase the speed and force of cardiac contractions. Diuretics are used to remove excess sodium and water from the body.

conglomerate, corporation whose asset growth, often very rapid, comes largely through the acquisition of, or merger with, other firms whose products are largely unrelated to each other or to that of the parent company. Merger to gain monopoly ("horizontal integration") was notable at the turn of the century, somewhat later, acquisition of suppliers or buyers ("vertical integration") became fairly common. Conglomerates did not emerge until the 1960s, when they quickly became popular among investors. Their stock prices often rose spectacularly, sometimes, however, they fell just as spectacularly. Economic advantages attributed to the conglomerate include protection against overspecialization, availability of management expertise, and reduced cost due to greater productive capacity.

conglomerate, in geology, sedimentary ROCK composed largely of pebbles or other rounded particles whose diameter is larger than 2 mm (0.08 in.). Essentially a cemented gravel, conglomerates are formed along beaches, as glacial drift, and in river deposits. Conglomerates formed of angular shaped pebbles are called breccias.

Congo (kɒŋɡoʊ), or **Zaire** (zɑɪər), great river of equatorial Africa, c 2,720 mi (4,380 km) long, formed by the waters of the Lualaba River and its tributary, the Luvua River, and flowing generally N and W through Zaire to the Atlantic Ocean. The second longest river of Africa and one of the longest in the world, the Congo River drains c 1,425,000 sq mi (3,690,750 sq km) including all of Zaire and parts of the Congo Republic, Cameroon, Central African Republic, Burundi, Tanzania, Zambia, and Angola. The Lualaba River, considered to be the upper Congo River, rises in SE Zaire, flows north over rapids and falls to Bukama, and thence across a vast plain and through a series of marshy lakes (Kabwe, Kabele, Upemba) to receive the Luvua River at Ankoro. The Luvua River has its most remote source in the Chambeshi River, which rises in N Zambia and flows southwest into swamps around Lake Bangweulu, it emerges from the swamps as the Luapula River, continues N along the Zaire-Zambia border into Lake Mweru, exits from there as the Luvua River, and continues NW to the Lualaba River. A third major headstream is the Lukuga River, which drains from Lake Tanganyika and joins the Lualaba River near Kabalo. From Kabalo, the Lualaba River flows N to Kisangani in a varied course marked by a deep and narrow gorge (the Gates of Hell) below Kongolo, a navigable stretch from Kasongo to Kibombo, a section of rapids and falls from Kibombo to Kindu, a shallow but navigable section from Kindu to Ubundu, and a section of seven cataracts—known as Stanley Falls—between Ubundu and Kisangani that marks the end of the Lualaba and the beginning of the Congo River proper. Below Kisangani, the Congo flows west and southwest, in a great curve unbroken by falls or rapids for about 1,090 mi (1,750 km) to Kinshasa. For most of its middle section the Congo is from 4 to 10 mi (6.4–16.1 km) wide, with many islands and sandbars. Because its many large tributaries (including the Lomami, Kasai, Lulunga, Ubangi, Aruvimi, Itimbiri and Mongala rivers) drain areas with alternating rainy seasons on either side of the equator, the Congo has a fairly constant flow throughout the year. Between Bolobo and Kwamouth the Congo narrows in width to between 1 mi and 1½ mi (1.6–2.4 km) but, c 350 mi (560 km) from its mouth, widens to form lakelike Stanley Pool (Mabele Pool), on which Kinshasa and Brazzaville are located. From the western end of Stanley Pool, the Congo descends 876 ft (267 m) in a series of 32 rapids, known as Livingstone Falls, to the port of Matadi. Below Matadi (83 mi/134 km inland) the Congo is navigable by ocean-going vessels and, despite such hazards as the whirlpools of the Devil's Caul-

dron, shifting sandbars, and sharp bends in the river, forms one of the largest natural harbors in Africa. The river is tidal to Boma, c 60 mi (100 km) upstream. The Congo River enters the Atlantic Ocean between Banana Point, Zaire, and Sharks Point, Angola, and dredging is required to keep a navigable channel open. The river is continued offshore by a c 500 mi (800 km) long submarine canyon that is c 4,000 ft (1,220 m) deep. With railroads to bypass major falls (Matadi-Kinshasa, Kisangani-Ubundu, Kindu-Kongolo), the Congo River and its tributaries form a system of navigable waterways c 9,000 mi (14,480 km) long, along which move much of central Africa's copper, palm oil kernels, cotton, sugar, and coffee. The chief ocean port is Matadi, with its associated oil port, Ango Ango, the chief river ports are Kinshasa and Kisangani. River steamers operate throughout the year between Kinshasa and Kisangani. The Congo River is Africa's largest potential source of hydroelectric power, the most valuable site is along Livingstone Falls, where the first phase of the Inga Power Project was begun in 1972. The mouth of the Congo River was visited (1482) by Diogo Cão, the Portuguese navigator. It became known as the Zaire River (a corruption of the local name *Mzadi* meaning "great water") and was later referred to as the Congo River (for the Kongo kingdom located near its mouth), it was renamed Zaire River by the government of Zaire in 1971. The Congo's lower course was traced upstream as far as Isangila by a British force under Capt J. K. Tuckey in 1816, and its upper headwaters by the missionary David Livingstone, who followed the Lualaba River to Nyangwe in 1871. The journalist Henry Stanley traveled from Nyangwe to Isangila and on to Boma during his great transcontinental journey (1874–77), thus proving the headwaters to be tributaries of the Congo River and not sources of the Nile as hypothesized by Livingstone. See W. H. Bentley, *Pioneering on the Congo* (2 vol 1900, repr 1970), Sir Harry Hamilton Johnston, *The River Congo, From its Mouth to Bolobo* (3d ed 1884, repr 1970).

Congo, Belgian: see ZAIRE

Congo, kingdom of the: see KONGO, KINGDOM OF THE

Congo, People's Republic of the, republic (1973 est pop 1,130,000), 132,046 sq mi (342,000 sq km), W central Africa. BRAZZAVILLE is the capital. The Congo is bordered on the W by Gabon, on the N by Cameroon and the Central African Republic, on the E and SE by Zaire, and on the SW by Cabinda, a Portuguese exclave, and by the Atlantic Ocean. The

terrain is covered mainly by dense tropical rain forest, with stretches of wooded savanna. Tributaries of the Congo and Ubangi rivers, which separate the Congo from Zaire, flow through the country. The climate is hot and rainfall is heavy. The Congo serves as the transport and commercial hub of central Africa, with economically important road, river, and rail systems connecting inland areas with the Atlantic. The country's internal road network is inadequate, however, and has hampered economic development. Agriculture and forestry are the chief economic activities in the Congo. The major subsistence crops are cassava and yams. Sugarcane and tobacco, raised primarily on plantations, are the leading export crops, followed by coffee, cocoa, palm products, and groundnuts. Timber is also a major export. Diseases restrict cattle raising, and

fishing is not well developed. Industry is limited mainly to the processing of agricultural and forest products, and is concentrated in Brazzaville and Pointe-Noire (both port cities) and in the Niari valley. Mining is increasingly important, with potash and oil the principal exports, petroleum resources are being rapidly depleted, however. The Bakongo, the major ethnic group in the Congo, are mostly farmers or traders, they are Bantu-speaking, as are the other principal tribes, the Bateke, the Mbochi, and the Sanga. Pygmies live in the north, and Vili people dwell along the coast. A majority of the Congolese people practice traditional animist religions, the rest are primarily Christian. French is the country's official language. Pygmies, migrating from the Zaire region, were probably the first inhabitants of what is now the Congo. They were followed by the Bakongo, the Bateke, and the Sanga, who arrived in the 15th cent. After the coastal areas were explored by the Portuguese navigator Diogo Cão in 1482, commerce developed between the Europeans and the coastal African states, which raided the interior for slaves to trade. Portuguese traders predominated throughout the 17th cent, although French trade centers were established (mainly at Loanga), and English and Dutch merchants sought commercial opportunities. Europeans penetrated inland in the late 19th cent, with Pierre Savorgnan de Brazza leading major expeditions in 1875 and 1883. In 1880 he negotiated an agreement with the Bateke to establish a French protectorate over the north bank of the Congo River. Between 1889 and 1910, the Congo (called the French Congo and later the Middle Congo) was administered primarily by French companies that held concessions to exploit the area's rubber and ivory resources. Scandals over the decimation of the African population through forced labor and portage broke out in 1905 and 1906. France restricted the role of the concessionaires in 1907, and in 1910 the Congo became a colony in French Equatorial Africa. Renewed forced labor and other abuses sparked an African revolt in 1928. The Free French forces made the Congo a bastion of their struggle against the Germans and the Vichy regime during World War II. In 1946, the region was granted a territorial assembly and representation in the French parliament. In the French constitutional referendum of 1958, the Congo opted for autonomy within the French Community. Full independence was achieved on Aug 15, 1960, with Fulbert Youlou as the first president. Forced to resign after a revolt in 1963, he was succeeded by Alphonse Massamba-Debat. In 1964 the new president founded a Marxist-Leninist party and proclaimed a noncapitalist path of economic development. A Five-Year Plan was initiated, and the state sector of the economy in agriculture and industry was expanded. Tensions between the government and the army grew, and in 1968, Marien Ngouabi, an army commander, seized power. He followed his predecessor's socialist policies, but created his own Marxist-Leninist type of party, the Congolese Workers party. An attempted coup in Feb, 1972, provided Ngouabi with a reason to purge opponents. In June, 1973, a new constitution was approved by referendum, it provided for popularly elected national, regional, and local assemblies. Despite radical rhetoric and close links with Communist countries, the Congo has retained close ties with France, it remains in the French franc zone and is an associate member of the European Common Market. The Congo is a member of a customs union with Gabon, the Central African Republic, Chad, and Cameroon, all of which share a central bank and a common currency. See Andre Gide, *Travels in the Congo* (tr 1927), Samir Amin and Catherine Coquery-Vidrovitch, *Histoire économique du Congo, 1880-1968* (1969), G. C. McDonald, *Area Handbook for People's Republic of the Congo* (1971).

Congregationalism, type of Protestant church organization in which each congregation, or local church, has free control of its own affairs. The underlying principle is that each local congregation has as its head Jesus Christ alone and that the relations of the various congregations are those of fellow members in one common family of God. Congregationalism eliminated bishops and presbyteries. The movement to which the name came to be applied began in the 16th and 17th cent in England, in a revolt against the formalized worship, unregenerate membership, and state control of the Established Church. Those holding such views found them-

selves unable to remain within the Church of England Robert BROWNE published in 1582 the first theoretical exposition of Congregational principles and expressed the position of some of those SEPARATISTS Churches established on such lines were started very early in the 17th cent in Gainsborough and Scrooby, but government opposition drove them into exile in Holland Not until the Protectorate did the Congregationalists make much progress About that time the name INDEPENDENTS was first introduced, a term long common in Great Britain (it is still used in Wales) but seldom used in America In 1658, when the Savoy Synod met in London, over 100 churches were represented With the Restoration came repression for the Independents, partly relieved by the Toleration Act of 1689 A marked tendency among English Congregationalists in the 19th cent was toward combination in larger fellowship Churches of this denomination formed a union in Scotland in 1812, in Ireland in 1829, in 1831 the Congregational Union of England and Wales was established The Congregational Union and the Evangelical Union were united in 1896 Membership in Congregational churches in Great Britain has declined in the 20th cent They have been active in ecumenical activities, and in 1972 most British Congregationalists and Presbyterians merged to form the United Reform Church Congregationalism was carried to America in 1620 by the Pilgrims, who were members of John Robinson's congregation in Holland, originally of Scrooby, England In America, Congregationalism reached its greatest public influence and largest membership In New England numerous communities were established based on Congregational-type religious principles In 1648 in the CAMBRIDGE PLATFORM a summary of principles of church government and discipline was drawn up Congregationalists took a leading part in the GREAT AWAKENING that, in New England, was started in 1734 by the preaching of Jonathan EDWARDS As the country expanded, Congregational churches were established in the newly opened frontier regions In 1810 the American Board of Commissioners for Foreign Missions began its work, in 1826 the American Home Missionary Society was formed These were followed, in 1846, by the American Missionary Association, primarily devoted to missionary work among blacks and Indians The early part of the 19th cent brought the Unitarian secession, when over 100 churches left the main Congregational body Congregational churches began to meet in local and then in statewide conferences, out of which developed (1871) the National Council of the Congregational Churches of the United States But each local church remained free to make its own declaration of faith and free to decide its own form of worship, in the conduct of the local church each member was granted an equal voice The principal assistants of the pastor are the deacons In education Congregationalists were always prominent, but the institutions of their founding—Harvard (1636), Yale (1701), Williams, Amherst, Oberlin, and many others—have been free from sectarianism The trend toward broader fellowship and larger cooperation was notably indicated in the merging in 1931 of the National Council of the Congregational Churches of the United States and the General Convention of the Christian Church (see DISCIPLES OF CHRIST) to form the General Council of the Congregational and Christian Churches of the United States The National Association of Congregational Christian Churches was formed in 1955 and had about 85,000 members in the early 1970s A move to unite the Congregational Christian Churches with the Evangelical and Reformed Church was approved by the councils of the two denominations in 1957, forming the UNITED CHURCH OF CHRIST See Williston Walker, *The Creeds and Platforms of Congregationalism* (1907, repr 1960), G G Atkins and F L Fagley, *History of American Congregationalism* (1942), D T Jenkins, *Congregationalism* (1954), A A Rounser, Jr, *The Congregational Way of Life* (1960), Horton Davies, *The English Free Churches* (2d ed 1963), M L Starkey, *The Congregational Way* (1966)

Congress of Racial Equality (CORE), civil rights organization founded (1942) in Chicago by James Farmer Dedicated to the use of nonviolent direct action, CORE seeks to promote better race relations and to end all discriminatory policies in the United States Its earliest activities were directed toward the desegregation of restaurants and other public accommodations in Chicago It later expanded its pro-

gram of nonviolent sit-ins to public accommodations in the South CORE first gained national recognition through its sponsorship (1961) of the Freedom Rides, a series of confrontatory bus rides throughout the South by interracial groups of CORE members and supporters The program, ultimately successful, was designed to end segregation on interstate bus routes CORE was one of the sponsors of the massive 1963 civil rights march on Washington In 1966, James Farmer resigned as national director of CORE and the organization's program became somewhat more separatist, concentrating on black voter registration in the South and on community problems, including slum housing and police mistreatment, in the North See study by August Meier and Elliot Rudwick (1973)

Congress of the United States, the legislative branch of the federal government, instituted (1789) by Article 1 of the CONSTITUTION OF THE UNITED STATES, which prescribes its membership and defines its powers Congress is composed of two houses—the Senate and the House of Representatives

The Senate The Senators, two from each state, have six-year terms and were chosen by the state legislatures until 1913, when the Seventeenth Amendment, providing for their direct popular election, went into effect Actually, many states, especially in the West, had already in effect adopted this reform through the use of the direct PRIMARY The terms of one third of the Senators expire every two years A Senator must be at least 30 years old, a US citizen of not less than nine years standing, and a resident of the state in which he is elected The Senate is presided over by the Vice President of the United States, who has no part in its deliberations and may vote only in case of a tie, in his absence his duties are assumed by a president pro tempore, elected by the Senate

The House of Representatives Members of the House of Representatives are apportioned among the states according to their populations in the federal census Every state is entitled to at least one Representative States that are entitled only to one (Alaska, Delaware, Nevada, North Dakota, Vermont, and Wyoming, by the 1970 census) have a Representative at large, i.e., one elected by the whole state The legislatures of those states entitled to more than one Representative have been required since 1842 to divide their states into congressional districts When a reapportionment is made and until a new districting is carried out, a state whose quota is changed may also elect Representatives at large Representatives are chosen for two-year terms, and the entire body comes up for reelection every two years A Representative must be 25 or older, a US citizen of at least seven years standing, and a resident of the state in which he is elected Although without a vote, one resident commissioner from Puerto Rico and one delegate from the District of Columbia sit in the House The presiding officer of the House, the speaker, is elected by the members of the House and may designate any member of the House to act in his absence In 1910 a revolt against the powerful speaker, Joseph Gurney CANNON, resulted in the transfer of much of the power and influence of that office to the House committees

Joint Activities In both houses the work of preparing and considering legislation is done by standing committees, and in addition there are special committees in each house as well as joint committees with bicameral membership The two houses have an equal voice in legislation, but revenue bills must originate in the House of Representatives Bills, after having been passed by each house separately, must be signed by the President within 10 days of their submission, or they become law automatically, unless Congress is not in session If vetoed by the President, a bill may become law only by its repassage by a two-thirds majority in each house The Constitution requires a regular annual meeting of Congress, which, since the passage of the Twentieth Amendment in 1933, begins on Jan 3 each year The President may call an extra session of Congress or of either house Only the House of Representatives may impeach the President or other federal officers and the Senate alone has the authority to try impeachments, but each house is the judge of the qualifications of its own members The Senate must ratify all treaties by a two-thirds vote and confirm important presidential appointments to office, including cabinet members, judges of federal courts, and high-ranking officers of the armed forces Because of this and because it is the smaller body and its members enjoy longer terms of office and virtually unlimited debate, the Senate is regarded as the more powerful of the two houses Congress, as a

whole, reached the zenith of its power during RECONSTRUCTION The proceedings of each house are recorded in the *Congressional Record* Throughout its history many critics have charged that Congress operates under antiquated machinery and processes that are inadequate Procedural reforms proposed include the adoption of a rule of relevancy in Senate debate, electric voting in the House, joint hearings on similar bills, liberalizing the methods by which a bill may be discharged from committee for consideration, and abolishing seniority as the basis for committee chairmanships See E S Griffith, *Congress Its Contemporary Role* (4th ed 1967), S C Patterson, comp., *American Legislative Behavior* (1968), Roger Davidson, *The Role of the Congressman* (1969), N W Polsby, *Congress and the Presidency* (2d ed 1971), Louis Fisher, *President and Congress* (1972), Aage Clausen, *How Congressmen Decide* (1973), John Kingdon, *Congressmen's Voting Decisions* (1973)

Congreve, William, 1670–1729, English dramatist, b near Leeds, educated at Trinity College, Dublin, and studied law in the Middle Temple After publishing a novel of intrigue, *Incognita* (1692), and translations of Juvenal and Persius (1693), he turned to writing for the stage His first comedy, *The Old Bachelor* (1693), produced when he was only 23, was extremely successful and was followed by *The Double Dealer* (1693) and *Love for Love* (1695) In 1697 his only tragedy, *The Mourning Bride*, was produced About this time Congreve replied to the attack on his plays made by Jeremy COLLIER, who in a famous essay attacked the English stage for its immorality and profaneness Congreve reached his peak with his last play, *The Way of the World* (1700), which has come to be regarded as one of the great comedies in the English language The leading female roles in Congreve's plays were written for Anne BRACEGIRDLE, who was probably his mistress He never married After 1700, Congreve did little literary work, perhaps because of the cool reception accorded his last play or because of his failing health—he suffered from gout He subsequently held various minor political positions and enjoyed the friendships of Swift, Steele, Pope, Voltaire, and Sarah, duchess of Marlborough The plays of Congreve are considered the greatest achievement of Restoration comedy They are comedies of manners, depicting an artificial and narrow world peopled by characters of nobility and fashion, to whom manners, especially gallantry, are more important than morals Congreve's view of mankind is amused and cynical His characters are constantly engaged in complicated intrigues, usually centering around money, which involve mistaken identities, the signing or not signing of legal documents, weddings in masquerade, etc His plays are particularly famous for their brilliance of language, for verbal mastery and wit they have perhaps been equalled only by the comedies of Oscar Wilde See his works (ed by F W Bateson, 1930), biographies by D C Taylor (1931), J C Hodges (1941), M E Novak (1971), and E W Fosse (1888, repr 1973), David Mann, ed., *A Concordance to the Plays of William Congreve* (1973)

Coniah (kōn'ā) see JEHOIACHIN

conical surface* see CONE

conic section or **conic** (kōn'ik), curve formed by the intersection of a plane and a right circular CONE (conical surface) The ordinary conic sections are the CIRCLE, the ELLIPSE, the PARABOLA, and the HYPER-

Conic sections

BOLA When the plane passes through the vertex of the cone, the result is a point, a straight line, or a pair of intersecting straight lines, these are called degenerate conic sections. There are many examples of the conic sections, both in nature and in technology. The orbits of planets and satellites are elliptical, and parallel reflectors (e.g., in telescopes) are parabolic in shape.

conifer (kōn'ifūr) [Lat., = cone-bearing], tree or shrub of the order Coniferales, e.g., the PINE, MONKEY-PUZZLE TREE, CYPRESS, and SEQUOIA. Most conifers bear cones and most are evergreens, though a few, such as the LARCH, are deciduous. Some have globular fruits, e.g., the YEW. Conifers are widely distributed over the world but are mostly found in the highlands of temperate regions. The conifers, the ginkgos, and the cycads comprise the three most important classes of gymnosperms, i.e., plants without true flowers. Conifers are classified in the division PINOPHYTA, class Pinopsida.

Coningh, Philips de see KONINCK, PHILIPS DE

Coningham, Sir Arthur (kūn'ing-am), 1895–1948, British air marshal, b. Australia. During World War I, he served first in the New Zealand army and then joined (1916) the Royal Flying Corps, a forerunner of the Royal Air Force. He remained in the air force and became air vice marshal after the outbreak of World War II. He commanded the tactical air support forces in North Africa (1941–43), during the invasion of Sicily and S. Italy (1943–44), and during the Normandy landings (1944–45). He became air marshal in 1946 and retired in 1947.

Coninxloo or Koninxloo, Gillis van (both gīl'is van kōn'ingkslō), 1544–1607, Flemish landscape painter. His *Judgment of Midas* (Dresden), *Latona* (Hermitage, Leningrad), and above all the *Landscape with Figures* (Liechtenstein Gall., Vienna) are fine examples of his art. Coninxloo's paintings, characterized by fantasy, warm tones, and refined realism, were important for the transmission of a Venetian type of landscape to the North.

conjugation, in genetics see RECOMBINATION

conjunction, in astronomy, alignment of two celestial bodies as seen from the earth. Conjunction of the moon and the planets is often determined by reference to the sun. When a body is in conjunction with the sun, it rises with the sun, and thus cannot be seen, its ELONGATION is 0°. The moon is in conjunction with the sun when it is new, if the conjunction is perfect, an ECLIPSE of the sun will occur. Mercury and Venus, the two inferior planets, have two positions of conjunction. When either lies directly between the earth and the sun, it is in inferior conjunction, when either lies on the far side of the sun from the earth, it is in superior conjunction.

conjunction, in English, PART OF SPEECH serving to connect words or constructions, e.g., *and*, *but*, and *or*. Most languages have connective particles similar to English conjunctions.

conjunctivitis (kən'jŭktiv'itēs), catarrhal inflammation of the membrane that covers the eyeball and lines the eyelid, usually acute, caused by a bacillus or virus. Commonly called pink eye, mild conjunctivitis usually causes redness, discharge, and itching of the membrane. If left untreated it usually clears up in 8 to 10 days. Conjunctivitis may also be associated with upper respiratory infection or with childhood diseases such as measles. The disorder, whether chronic or acute, is treated successfully with antibiotics, sometimes combined with cortisone. TRACHOMA, though rare in the United States, is a severe conjunctivitis that can cause loss of vision. Another severe form of conjunctivitis is caused by the gonococcus bacterium and is usually associated with a genital infection. Conjunctivitis in newborn infants, called ophthalmia neonatorum, was a problem at one time, however, routine instillation of silver nitrate solution into the eyes of newborn infants has materially reduced the incidence of blindness.

Conklin, Edwin Grant, 1863–1952, American zoologist, b. Waldo, Ohio, B.S. Ohio Wesleyan Univ., 1886, Ph.D. Johns Hopkins Univ., 1891. From 1903 he taught and conducted research at Princeton, principally in cytology (particularly cell division), embryology, and heredity. His chief interest was evolution. He wrote *Heredity and Environment* (1915) and many other works, and he was influential in organizing the marine biology laboratory at Woods Hole, Mass.

Conkling, Roscoe, 1829–88, American politician, b. Albany, N.Y. On his admission to the bar in 1850, he

was immediately appointed district attorney of Albany. The son of Alfred Conkling, Congressman and Federal judge, he became a U.S. Representative (1859–63, 1865–67) and Senator (1867–81) and undisputed leader of the Republican party in New York. Conkling's machine was built upon Federal patronage, which was entirely his during the Grant administrations. But in 1878, President Hayes, an advocate of civil service reform, removed two Conkling lieutenants, Chester A. ARTHUR and Alonzo B. CORNELL, from the management of the New York customhouse in defiance of Conkling, who claimed that a Senator had the right to control Federal patronage in his state. Conkling was reelected, and another lieutenant, Thomas C. PLATT, became his colleague in the Senate, while Cornell won the governorship. Conkling headed the third-term movement for Grant in 1880 and placed him in nomination at the Republican national convention. Although his Old Guard or "Stalwarts" faction was unsuccessful, he prevented the nomination of James G. BLAINE, his bitter personal enemy. The deadlocked convention chose James A. GARFIELD as a compromise candidate, and Chester A. Arthur was named for Vice President as a sop to the "Stalwarts." Conkling gave Garfield only lukewarm support but claimed afterwards that the President-elect had promised him the patronage in return. Garfield denied this and further antagonized Conkling by making Blaine Secretary of State. When an anti-Conkling man was appointed collector of the port of New York, Conkling resigned from the Senate in protest. Platt soon followed his leader, earning for himself the nickname "Me Too." The two expected vindication through reelection by the state legislature, but both were defeated. Conkling then retired to the private practice of law, in which he was highly successful. See biography by his nephew, A. R. Conkling (1889), study by David M. Jordan (1971).

Connacht see CONNAUGHT, Ireland

Connally, John Bowden (kōn'ālē), 1917–, U.S. public official, b. Floresville, Texas. A lawyer, he became associated with Lyndon B. Johnson, managed the latter's successful senatorial campaign in 1948, and later served as Johnson's administrative assistant. He was named Secretary of the Navy in 1961, but he resigned (1962) to campaign for the governorship of Texas and was elected. When President John F. Kennedy was assassinated in Dallas, Connally was accompanying him and was wounded. He was twice reelected governor, serving until 1968. A conservative Democrat, he was chosen (1971) by President Richard M. Nixon as Secretary of the Treasury and was instrumental in bringing about the institution of a 90-day wage-price freeze in Aug., 1971. In May, 1972, Connally resigned from the cabinet to aid the President's reelection. The following year Connally joined the Republican party and served as a special adviser to the President after the resignation of key aides as a result of the WATERGATE AFFAIR. He left the White House shortly after that, however, and in July, 1974, was himself indicted for accepting a bribe from milk producers before the 1972 election. See studies by Charles Ashman (1974) and A. F. Crawford and Jack Keever (1974).

Connaught, Arthur William Patrick Albert, duke of (kōn'ōt), 1850–1942, English prince, son of Queen Victoria and Prince Albert, brother of Edward VII. Trained for a military career, he served in Egypt (1882) and India (1886–90) and as commander in chief in the Mediterranean (1907–9). He was (1911–16) governor general of Canada. His son, Prince Arthur of Connaught, 1883–1938, was (1920–23) governor general of South Africa.

Connaught or Connacht (both kōn'ōt, kōn'ākht), province (1971 pop. 389,763), 6,611 sq mi (17,122 km), W. Republic of Ireland, comprising the counties of MAYO, SLEIGO, LEITRIM, ROSCOMMON, and GALWAY. It was one of the ancient kingdoms of Ireland, whose rulers, the O'Connors, were supplanted by the Anglo-Norman De Burghs in the 13th cent.

Conneaut (kōn'ēōt'), city (1970 pop. 14,552), Ashtabula co., extreme NE Ohio, on Lake Erie, near the Pa. line, settled 1799, inc. 1834. It is a port of entry—an important ore-receiving port and a limestone and coal loading center—and a vacation resort. Conneaut has a railroad museum, with antiques of the steam era.

Connecticut (kənēt'ikət), state (1970 pop. 3,031,709), 5,009 sq mi (12,973 sq km), NE United States, southernmost of the New England states, one of the Thirteen Colonies. HARTFORD is the capital and the largest city, with BRIDGEPORT and NEW HAVEN next in size. Rectangular in outline, the state extends c. 90 mi (145 km) from east to west and c. 55 mi (90 km) from

north to south, it is bounded on the N by Massachusetts, on the E by Rhode Island, on the S by Long Island Sound, and on the W by New York. Connecti-

cut is divided into two roughly equal sections, usually called the eastern highland and the western highland. These sections are separated by the Connecticut valley lowland. The Connecticut River, which flows through only the northern half of the valley, veers off to the southeast at Middletown in central Connecticut. Along the Long Island Sound there is a low, rolling coastal plain. The western highland, with the Taconic Mts. and the Litchfield Hills, is more rugged than the eastern highland. A few isolated peaks in the west are more than 2,000 ft (610 m) high. The Thames and the rivers emptying into it drain the eastern highland, and the Housatonic, with its chief tributary, the Naugatuck, drains the western highland. Though famed for its rural loveliness, Connecticut is heavily industrialized and derives most of its economic wealth from its industries. Textiles, typewriters, silverware, sewing machines, clocks, and watches are among Connecticut's many industrial products. The state's principal industries produce transportation equipment, non-electrical and electrical machinery, fabricated metals, primary metals, and chemicals. Firearms and ammunition, first produced in Connecticut at the time of the American Revolution, are still manufactured in the state. Groton is an important center for submarine building. Agriculture accounts for only a small share of income in the state, dairy products, eggs, and tobacco are the leading farm items. High grade broadleaf tobacco, used in making cigar wrappers, has been a specialty of Connecticut agriculture since the 1830s. Largely shade-grown in the fertile Connecticut valley, it remains a valuable crop although production has been adversely affected by new methods of cigar production. Many varieties of fish, as well as oysters, lobsters, and other shellfish, are caught in Long Island Sound, but the fishing industry is small. Few minerals are produced, stone, sand, and gravel account for most income derived from mining. Insurance is an important industry in Connecticut, and Hartford is one of the world's largest insurance centers, with the home offices of many insurance companies located in the city. In 1614, Adriaen Block, a Dutchman, sailed through Long Island Sound and discovered the Connecticut River. The Dutch built a small fort in 1633 on the site of present-day Hartford, but they abandoned it in 1654 as English settlers moved into the area in increasing numbers. Edward Winslow of Plymouth Colony was apparently the first Englishman to visit (1632) Connecticut, and in 1633 members of the Plymouth Colony established a trading post on the site of WINDSOR. This small Pilgrim enterprise was soon absorbed by Puritan settlers from the Massachusetts Bay Company. These settlers had been attracted to the area by the excellent reports brought back by one of their members, John Oldham, in 1633. Oldham returned to the Connecticut area in 1634 and established still another trading post, which became WETHERSFIELD. The following year Puritans flocked in great numbers to the Connecticut valley. In 1636, Thomas Hooker and his congregation left Newtown (present-day Cambridge, Mass.) and settled near the Dutch trading post that had been established on the site of present-day Hartford. Although some of the migrants, like Hooker, had chafed under the restrictive laws of the Massachusetts Bay colony, it was the desire for more and better land rather than religious differences that prompted the Puritan migration. Their departure was without bitterness, and the Connecticut venture had the official blessing of the Massachusetts Bay colony. Land was purchased

from the natives, who were on the whole friendly. The PEQUOT INDIANS resisted white settlement, but they were defeated by the English under John Mason (c 1600–1672) and John Underhill (c 1597–1672) in the short Pequot War of 1637. Not until King Philip's War in 1675–76 was there further serious trouble with the Indians. In 1638–39 representatives of the three Connecticut River towns—Hartford, Windsor, and Wethersfield—met at Hartford and formed the colony of Connecticut. They also adopted the FUNDAMENTAL ORDERS, which established a government for the colony. Under these statutes any householder who had taken a Trinitarian oath of fidelity to the commonwealth was admitted to the town meeting, which acted on local affairs and voted for deputies to the colony's General Court. However, "admitted inhabitants" could not themselves be deputies unless the General Court or a magistrate considered them worthy to be "freemen," and probably less than a third achieved that distinction. Those freemen elected to the General Court, which met at Hartford, chose the magistrates, one of whom was selected to be governor (John Haynes was the first). The governor had to be a member of some approved congregation, and his authority was dwarfed by the great power of the General Court, which exercised both legislative and judicial functions. A second colony, Saybrook, had been established at the mouth of the Connecticut River in 1635 by a group of Englishmen. The colony's founders (who included Viscount Saye and Sile and Baron Brooke, for whom the colony was named) subsequently became embroiled in politics at home during the ENGLISH CIVIL WAR (1642–52) and sold the Saybrook settlement to Connecticut colony in 1644. Connecticut's population expanded gradually, and by 1662 the colony included over a dozen towns, including Saybrook, NEW LONDON, FAIRFIELD, and NORWALK as well as East Hampton and Southampton on Long Island. Another Puritan settlement, New Haven, was established in 1638. It was not connected with Connecticut colony. Theophilus Eaton and John Davenport, a pastor, were the leaders of the settlement, which was initially founded as a trade center. New Haven was an extreme Puritan theocracy. Its freemen, unlike those of Connecticut colony, had to be church members, and a select group among them formed the General Court, which drew up the settlement's laws. New Haven was unique among the Puritan colonies in denying its people trial by jury. The towns of Milford, Guilford, Stamford, Southold (on Long Island), and Branford were dominated by New Haven and in 1643 formed with the mother town a loose confederation called New Haven colony. In 1643, New Haven and Connecticut colonies joined with Massachusetts Bay colony and Plymouth colony to form the NEW ENGLAND CONFEDERATION, a loose union for mutual defense against attack by Indians or by the Dutch who at that time still maintained a fort in the Hartford area. In 1660 the restoration of Charles II to the English throne caused alarm in the New Haven and Connecticut settlements because neither colony had obtained a charter for its establishment and thus had no legal standing in England as colonies. Connecticut sent its governor, John Winthrop (1606–76), to London to secure a royal charter for the colony. In 1662, Winthrop obtained the charter, by which Connecticut not only won its legal right to exist as a corporate colony but also acquired New Haven. Most of the towns within the New Haven colony quickly affirmed the union, but New Haven itself bitterly resisted absorption until, faced with the even more unpleasant prospect of becoming part of the proprietary grant to the west given (1664) to the duke of York, it formally submitted on Jan. 5, 1665. The duke of York surrendered his claim to New Haven in return for the Long Island towns formerly incorporated into the New Haven colony. Connecticut's size varied little after that time, though there were boundary squabbles with Massachusetts, Rhode Island, and New York for many years thereafter. Connecticut's new charter confirmed the Fundamental Orders and subsequent laws so that government went on much as before, except for a brief interruption from 1687 to 1689 when the English tried to assert control over the colony and dispatched an administrator, Sir Edmund Andros, to Connecticut. Andros sought to recover the charter from the colonists, who hid it in an oak tree that came to be known as the Charter Oak. In 1708, Congregationalism was established as the official religion of the colony by the Saybrook Platform, and a modified Presbyterian type of church government was adopted. In 1708 the General Court also passed a limited toleration act, and later the Angli-

cans (1727), the Baptists, and the Quakers (1729) were exempted from contributing to the support of the Established Church. However, other dissenting groups that lacked the political influence in England possessed by the Anglican, Baptist, and Quaker sects were treated harshly. Connecticut thus occupied a position midway between the more autocratic ecclesiastical system of Massachusetts and the liberal one of Rhode Island. Nevertheless religious harmony generally prevailed until the 1730s, when the GREAT AWAKENING split the Congregational Church into radical and conservative factions. Connecticut's agrarian economy was gradually being transformed, as a small but vigorous merchant class arose. Most of Connecticut's trade, which was based on the exportation of agricultural products and the importation of manufactured goods, was controlled by New York and Boston merchants. Connecticut's ports on Long Island Sound, however, maintained commercial relations with the West Indies, and the colony came to resent England's increasingly burdensome commercial and colonial policy. The years from 1750 to 1776 saw much bitter disagreement between radicals and conservatives in the colony, and in 1766 the radicals managed to oust the governor, Thomas Fitch, and four of his assistants. The conservatives never recovered their power in colonial days. Most of the conservative Congregationalists ultimately supported the patriot cause, but the Anglicans made up the bulk of the state's die-hard Tories. In 1776, the patriot governor, Jonathan Trumbull, was re-elected almost unanimously (Connecticut and Rhode Island were the only colonies privileged to elect their chief executives), and he was the only governor of any colony to be retained in office after the outbreak of the American Revolution. There was little fighting in Connecticut during the Revolution—skirmishes at Stonington (1775), Danbury (1777), New Haven (1779), and New London (1781)—but the state was the principal supply area for the Continental Army. After the war the state relinquished (1786) to the United States its claims to western land, except the WESTERN RESERVE, an area in present-day Ohio. The claim was retained until part of the land was given to Connecticut citizens in 1792 and the remainder sold in 1795. In 1799, Connecticut's long dispute with Pennsylvania over the WYOMING VALLEY was finally settled. Connecticut was one of the first states to approve the Federal Constitution (see FEDERAL CONSTITUTIONAL CONVENTION). The Embargo Act of 1807, passed during the administration of Thomas Jefferson, was vehemently denounced throughout New England, the ports on Long Island Sound and on the Connecticut River had developed a lively carrying trade with which the embargo interfered. The War of 1812 was also so unpopular that New England Federalists, meeting at the HARTFORD CONVENTION in late 1814, considered secession. Soon thereafter, in early 1815, the war was ended and the Federalist party subsequently declined as a result of its participation in the Hartford Convention, which some considered to have been a treasonable meeting. In 1818 the Jeffersonians came into power in the state, and a new constitution, replacing the old charter of 1662, was adopted. It disestablished the Congregational Church and greatly extended the franchise, although universal manhood suffrage was not proclaimed until 1845. Meanwhile, after Connecticut's shipping industry had been ruined by the embargo and the war, the state turned to manufacturing. Artisans and craftsmen had become increasingly numerous in late colonial days, and from native iron ore Connecticut forges had produced guns for the patriot soldiers. Modern mass production had its beginning in the state when Eli Whitney, probably the best known of Connecticut's inventors, established (1798) at New Haven a firearms factory that began making guns with standardized, interchangeable parts. Earlier, in 1793, he had invented and manufactured the cotton gin at New Haven. The manufacture of notions (buttons, pins, needles, metal goods, and clocks) gave rise to the enterprising "Yankee peddler," who, with horse and team, covered the nation hawking his wares. Connecticut's insurance industry also developed during this period, and in 1810 the Hartford Fire Insurance Company was established. Connecticut, which had placed limitations on slavery in 1784 and abolished it in 1848, supported the Union during the Civil War with nearly 60,000 troops and an able Secretary of the Navy, Gideon Welles. During and after the war, industry expanded greatly. Immigration provided a cheap labor supply as English, Scottish, and many Irish immigrants, who had arrived in large numbers even before the war, were followed by French Canadians and, in the late 19th and early

20th cent., by Italians, Poles, and others. During World Wars I and II Connecticut prospered, providing munitions and other supplies for the war effort. However, between the two wars the Great Depression left many unemployed in the state. Connecticut's industries have continued to grow and develop since the end of World War II, and in 1954 the world's first nuclear-powered submarine was launched at Groton. Prior to 1965, Connecticut's constitution provided for a bicameral legislature with a house of representatives elected on the basis of geographical distribution. No town or city had less than one or more than two representatives, thus the larger cities were underrepresented. The 1965 constitution remedied this situation by providing for the election of both houses of the general assembly, as the legislature is called, on the basis of election districts apportioned according to population. Connecticut's state senate has 36 members and its house of representatives has 177, members of both houses are elected for two-year terms. The state executive branch is headed by a governor elected for a term of four years, Ella T. GRASSO, a Democrat, was elected governor in 1974. Connecticut is represented in the U.S. Congress by six Representatives and two Senators and has eight electoral votes. In recent decades political power in the state has generally shifted back and forth between Democrats and Republicans. The Connecticut shore is a popular summer resort area, and the protected waters of Long Island Sound lure boating enthusiasts to the state. Another prominent summer attraction is the Stratford Shakespeare Festival, which has been operating since 1965. Institutions of higher learning in Connecticut include Yale Univ., at New Haven, Trinity College, at Hartford, Wesleyan Univ., at Middletown, the Univ. of Connecticut, at Storrs, and the UNITED STATES COAST GUARD ACADEMY and Connecticut College, at New London. See *Federal Writers' Project, Connecticut: A Guide to Its Roads, Lore, and People* (1938), Stewart H. Holbrook, *The Yankee Exodus* (1950), Albert E. Van Dusen, *Connecticut* (1961), R. J. Purcell, *Connecticut in Transition 1775–1818* (1963), J. Niven, *Connecticut for the Union* (1965), R. L. Bushman, *From Puritan to Yankee* (1967), William S. Bixby, *The Connecticut Guide* (1974).

Connecticut, river, longest river in New England, 407 mi (655 km) long, rising in Connecticut Lakes, N. N. H., and flowing S along the Vt.-N. H. line, then across Mass. and Conn. to enter Long Island Sound at Old Saybrook, Conn., drains c 11,000 sq mi (28,500 sq km). There are many rapids and falls on the river, Holyoke Falls, the highest, drops 57 ft (17 m). The river is navigable to Hartford, Conn. The Connecticut Valley is one of the best agricultural regions in New England. World-famous cigar binder and wrapper tobacco are grown in the lower part of the valley, truck farming and dairying are also important. Waterpower resources led to the rise of industrial cities in the 1800s, and the valley became a major manufacturing region, large centers include Holyoke and Springfield, Mass., and Windsor, Conn. There are several hydroelectric facilities on the river. Floods and hurricanes caused great damage in the valley in 1938 and 1953, in the latter year, the Connecticut River Flood Control Compact was established and has since sponsored the building of flood-control devices on the river.

Connecticut, University of, mainly at Storrs, coeducational, land grant and state supported, chartered and opened 1881 as Storrs Agricultural School. It became a college in 1893 and a university in 1939. The schools of medicine, law, insurance, and social work are in Hartford. There are two-year branch campuses at Hartford, Waterbury, Stamford, Groton, and Torrington. The Storrs Agricultural Experiment Station is noteworthy.

Connecticut College, at New London, coeducational, chartered 1911 (as Thames College, name changed the same year to Connecticut College for Women), opened 1915. In 1959 men were admitted for graduate work and the school became known by its present name. In 1969 the undergraduate college became coeducational. A 313-acre (127-hectare) arboretum and a plant hormone laboratory are noteworthy.

Connecticut Reserve. see WESTERN RESERVE

Connecticut Wits or Hartford Wits, an informal association of Yale students and rectors formed in the late 18th cent. At first they were devoted to the modernization of the Yale curriculum and declaring the independence of American letters. In their political views they were conservative Federalists, and they attacked their more liberal opponents in jointly

written satirical verses—*The Anarchiad* (in the *New Haven Gazette*, 1786–87), *The Political Greenhouse* (in the *Connecticut Courant*, 1799), and *The Echo* (in the *American Mercury*, 1791–1805). Members of the group at various times were Joel Barlow, Timothy Dwight, David Humphreys, John Trumbull, Lemuel Hopkins, Richard Alsop, and Theodore Dwight. See studies by V. L. Parrington (1926, repr. 1969) and Leon Howard (1943).

connective tissue, supportive tissue widely distributed in the body, characterized by large amounts of intercellular substance and relatively few cells. The intercellular material, or matrix, is produced by the cells and gives the tissue its particular character. Connective tissue is diversified in function and may be divided into four categories according to the type of matrix. In connective tissue proper (which forms the framework for most organs) the matrix is soft. In CARTILAGE it is firm but flexible. The intercellular substance of BONE, which is high in mineral salts, is rigid. BLOOD and lymph have a fluid matrix. Three kinds of fibers generally form the supportive material in connective tissue proper. White, or collagenous, fibers vary in size and are composed of fine, parallel fibrils; reticular fibers are small, branching fibers that take on a meshlike pattern, yellow, or elastic; fibers are highly flexible and are capable of branching and anastomosing (or opening) directly into one another. Loose, or areolar, connective tissue is composed of all three of the above fibers; it supports most of the organs in the body and is widely distributed under the skin. The type of connective tissue that forms TENDONS, LIGAMENTS, and FASCIA is composed mainly of collagenous fibers. It is known as compact tissue. Reticular connective tissue forms the bone marrow and the framework for lymphoid tissue. Adipose, or fat, tissue serves as a cushion for various organs and as a fat reservoir. The colored area of the eye, or iris, is composed of pigmented connective tissue.

Connellsville, city (1970 pop. 11,643), Fayette co., SW Pa., on the Youghiogheny River in the Allegheny Mts., settled c. 1770, inc. as a borough 1806, as a city 1911. A major producer of coal and coke, the city also has railroad shops, its manufactures include glass, iron, and steel products. The attack upon Henry C. Frick by the anarchist Alexander Berkman occurred (1892) in Connellsville during the HOMESTEAD STRIKE. A branch of Pennsylvania State Univ. is just south of the city.

Connelly, Marc (Marcus Cook Connelly), 1890–, American dramatist, b. McKeesport, Pa. He is best known for his folk play *The Green Pastures* (1930), a fantasy of Biblical history presented in terms of the life of the Southern Negro; it was based on Roark Bradford's book *Ol' Man Adam an' His Chillun* (1928). Connelly also collaborated with George S. Kaufman on the plays *Dulcy* (1921), *To the Ladies* (1922), *Merton of the Movies* (1922), and *Beggar on Horseback* (1924). At the age of 74 Connelly published his first novel, *A Souvenir from Quam* (1965), which satirizes spy stories. See his memoirs (1968).

Connemara (kōnəmar'ə), wild, mountainous region, Co. Galway, W. Republic of Ireland, lying between the Atlantic Ocean and Loughs Corrib and Mask. There are many mountains, lakes, streams, and glens. It is a well-known vacation area. Most of the villages are found along the coast. Clifden is the chief town. The peat bogs of S. Connemara are major fuel sources. Particularly famous is the hardy breed of ponies peculiar to the region.

Connorsville, city (1970 pop. 17,604), seat of Fayette co., E. central Ind., on the Whitewater River, in a farm area, founded 1813 by John Connor (who had been kidnapped from his white parents and raised by Indians), inc. as a city 1870. Nearby are a bird sanctuary of the state Audubon Society, a state park, and several historic covered bridges.

Connolly, Cyril, 1903–74, English critic and editor. He began his career as a journalist. With Stephen SPENDER he founded *Horizon* (1940–49), a small literary magazine that reflected Connolly's own iconoclastic and mordant attitudes toward contemporary society. Among his works are *Rock Pool* (1935), a satirical novel that ranks with the best of Huxley and Waugh, *Enemies of Promise* (1938), an autobiography of ideas, *The Unquiet Grave* (1944), a potpourri of critical commentaries and aphorisms, *The Condemned Playground* (1945) and *Previous Convictions* (1964), both collections of literary essays, and *The Modern Movement: 100 Key Books From England, France, and America, 1880–1950* (1965).

Connolly, James, 1870–1916, Irish nationalist and socialist. An advocate of revolutionary SYNDICALISM, he went (1903) to the United States, where he

helped to organize the Industrial Workers of the World (IWW). Returning to Ireland, he became an organizer of the Belfast dock workers. He helped James LARKIN to organize the Irish Transport and General Workers Union and, during the great lock-out of the Dublin transport workers in 1913, organized a citizen army. Convinced that the triumph of Irish nationalism was a prerequisite for the success of Irish socialism, he joined the Easter Rebellion of 1916. He was wounded, court-martialed, and executed. See two selections from his writings *Socialism and Anatomy* (with intro and notes by Desmond Ryan, 1948) and *The Workers' Republic* (ed. by Desmond Ryan, 1951), biography by C. D. Greaves (1972).

Connolly, Maureen, 1934–1969, American tennis player, b. San Diego, Calif. She became, at 16, the youngest player to win the U.S. national singles. She successfully defended the U.S. title (1952, 1953), won the Wimbledon championship (1952, 1953, 1954), and completed a grand slam of the world's four major titles in 1953 with the French and Australian championships. Little Mo, as she was known, was one of America's greatest woman tennis players. She broke her leg in a horseback accident and was forced to retire (1955).

Connor, Ralph: see GORDON, CHARLES WILLIAM

Conon, 3d cent. B.C., Greek astronomer and mathematician of Samos. He traveled in the western part of the Greek world making astronomical observations, then settled at Alexandria. He was a student of solar eclipses and discovered the constellation Coma Berenices. His mathematical studies included an investigation of conic intersections.

Cononiah (kōn'ōn'ā), Levite of Hezekiah's reign. 2 Chron. 31:12, 13.

Conowingo Dam (kōn'awīng'gō), 4,648 ft (1,417 m) long, 102 ft (31 m) high, on the Susquehanna River, NE Md., completed 1928. It is one of the largest nonfederal hydroelectric power plants in the United States, with a 474,480-kw capacity. Conowingo Lake, formed by the dam, extends 14 mi (23 km) upstream.

conquistador (kōnkwis'tādōr, Span. kōng-kē'-stādōr'), military leader in the Spanish conquest of the New World in the 16th cent. FRANCISCO PIZARRO, the conqueror of Peru, and Hernán CORTÉS, the conqueror of Mexico, were the greatest of the conquistadors. The name is frequently used to mean any daring, ruthless adventurer. See Paul Horgan, *Conquistadors in North American History* (1963), F. A. Kirkpatrick, *The Spanish Conquistadores* (2d ed. 1967).

Conrad I, d. 918, German king (911–18). As duke of Franconia he distinguished himself by military exploits and in 911 was elected successor to LOUIS THE CHILD by the Franconian, Saxon, Bavarian, and Swabian lords. Although supported by the bishops, he was unable to maintain strong central government. His reign was plagued by feuds and rebellions by the great feudal lords. Lorraine broke away and acknowledged CHARLES III of France, the Swabians continued warfare till Conrad's death, the duke of Bavaria, expelled, returned successfully. Conrad's most able foe was Henry the Fowler, duke of Saxony. Despite the enmity, Conrad's own deathbed advice was that Henry succeed him. Henry was elected (919) as HENRY I. Conrad's failure to avert the continued Hungarian invasions and his alienation of the nobility increased provincial autonomy and almost dissolved the kingdom.

Conrad II, c. 990–1039, Holy Roman emperor (1027–39) and German king (1024–39), first of the Salian dynasty of the Holy Roman Empire. With the end of the Saxon line on the death of HENRY II, the succession passed to the matrilineal descendants of OTTO I, and Conrad, a Franconian noble, was elected (1024) as German king. Although the hereditary principle in Germany was strong enough to secure his election, it did not ensure Conrad support throughout the empire. His accession was contested by his stepson, Ernest of Swabia, and by the Lotharingians (see LOTHARINGIA) and the Italians. After the collapse of the revolts of Ernest and the Lotharingians, Conrad brought N. Italy into submission (1026–27) and was crowned emperor at Rome. He suppressed two more revolts (1027, 1030) by Ernest and won (1031) Lusatia from Poland. In 1034 he annexed the kingdom of Burgundy (see ARLES KINGDOM) under the terms of a treaty (1006) between Rudolf III, last independent king of Arles, and Holy Roman Emperor Henry II. In 1036, Conrad returned to Italy, where war was raging between the greater and the lesser nobles. He deposed Archbishop Anbert of Milan, a

powerful ally of the great nobles, and made the fiefs of the lesser nobles hereditary by issuing (1037) the Constitution of Pavia. In Germany also Conrad favored the small nobility, thus reversing the policy of Otto I and Henry II, who had depended for support on the Church. He promoted the servile classes to administrative office, thus building a new hereditary class of *ministeriales* to replace the ecclesiastics in the civil service. Conrad's administration was economical, and he encouraged commerce by granting market and mint privileges. At his death, his son HENRY III ascended the throne at the height of its wealth and power.

Conrad III, c. 1093–1152, German king (1138–52), son of Frederick, duke of Swabia, and Agnes, daughter of Holy Roman Emperor Henry IV, first of the HOHENSTAUFEN dynasty. He joined his brother Frederick, who had been defeated in the imperial election of 1125 by Lothar of Saxony (Holy Roman Emperor LOTHAR II), in rebelling against Lothar. Set up as antiking to Lothar in 1127, he went to Italy (1128) and, despite excommunication by Pope Honorius II, was crowned king at Milan. He subsequently failed to make any progress as king and submitted to Lothar in 1135. After Lothar's death he was elected king by the nobles and ecclesiastics who were afraid to increase the power of Lothar's son-in-law, HENRY THE PROUD of Bavaria. Conrad deprived Henry of his duchies, giving Saxony to ALBERT THE BEAR and Bavaria to Leopold of Austria. A civil war broke out and was continued after Henry's death by his brother Guelph (or Welf) and the Saxons, who supported Henry's young son HENRY THE LION. From this strife emerged the opposing parties of the Guelphs and the Ghibellines, representing the Hohenstaufen. A short-lived truce was made in 1142. At Christmas, 1146, Conrad was induced by St. Bernard of Clairvaux to join in the Second Crusade (see CRUSADES) with Louis VII of France. He left in 1147, took part in the unsuccessful siege of Damascus, and returned in 1149. Conrad was never crowned by the pope, and therefore was not confirmed as Holy Roman emperor. His ambitions for the imperial crown and against Roger II of Sicily were thwarted by Guelph, who was subsidized by Roger, and by Henry the Lion, who claimed the duchy of Bavaria. Conrad was succeeded by his nephew, Holy Roman Emperor Frederick I.

Conrad IV, 1228–54, German king (1237–54), king of Sicily and of Jerusalem (1250–54), son of Holy Roman Emperor FREDERICK II. He was elected (1237) king of the Romans at his father's instigation after Frederick had deposed Conrad's older brother Henry in Germany. Archbishop Siegfried II of Mainz was regent for Conrad until 1241, when he was replaced by Henry Raspe, count of Thuringia. The struggle for supremacy between Frederick and Pope INNOCENT IV resulted in the election (1246) of Raspe as antiking at the behest of the pope. Germany was plunged into disorder, after Raspe's death (1247) WILLIAM, COUNT OF HOLLAND became antiking. When Frederick II died (1250) Conrad carried on the struggle with the pope, who was determined to bring about the downfall of the house of HOHENSTAUFEN and to rule in Italy. In 1251, Conrad went to Italy in order to subdue the pope's supporters. He had some successes, but Innocent IV refused to give up his scheme for papal control in Italy. He offered the crown of Sicily to RICHARD EARL OF CORNWALL, and to Charles of Anjou (later CHARLES I, king of Naples and Sicily), who both refused, and to King Henry III of England for his second son, Edmund. He accepted. In 1254 Conrad was excommunicated. Just as war was about to erupt he died of fever. It was left for his son, CONRADIN, to witness the final downfall of the house of Hohenstaufen.

Conrad, d. 1192, Latin king of Jerusalem (1192), marquis of Montferrat, a leading figure in the Third Crusade (see CRUSADES). He saved Tyre from the Saracens and became (1187) its lord. In 1189 he joined GUY OF LUSIGNAN at the siege of AKKO, but a year later he sought to displace Guy as king of Jerusalem. To establish a claim to the crown he married Isabella, daughter of Amalric I. A compromise (1191) between the two men was short-lived. In 1192, Conrad was acknowledged as king, but a few days later he was assassinated, probably by Muslim fanatics. The royal title passed to the two later husbands of his widow—Henry, count of Champagne (1192–97), and AMALRIC II.

Conrad, Joseph, 1857–1924, English novelist, b. Poland, originally named Josef Teodor Konrad Walecz Korzeniowski. He is considered one of the greatest novelists and prose stylists in English literature. In 1874, Conrad went to sea and later joined (1878) an

English merchant ship, becoming (1884) a master mariner as well as a British citizen. Retiring from the merchant fleet in 1894, he began his career as a novelist, and all of his novels are written in English, an acquired language. His notable early works include *The Nigger of the Narcissus* (1897), *Lord Jim* (1900), and the novellas *Youth* (1902), *Heart of Darkness* (1902), and *Typhoon* (1903). The novels *Nostromo* (1904), *The Secret Agent* (1907), *Under Western Eyes* (1911), and *Chance* (1913) are regarded by many as Conrad's greatest works. Of his later works, *Victory* (1915) is the best known. He also collaborated on two novels with Ford Madox Ford, *The Inheritors* (1901) and *Romance* (1903). Marked by a distinctive, opulent prose style, Conrad's novels combine realism and romanticism. Their backgrounds shift from the sea to politics to society. Conrad was a genius in the creation of atmosphere and character, the impact of various situations was augmented by his expert use of symbolism. He portrayed acutely the conflict between primitive cultures and modern civilization and was particularly adept at delineating people suffering from isolation, loneliness, and moral deterioration. See his complete works (26 vol., 1924-26), biographies by Jocelyn Baines (1960) and Ford Madox Ford (1965), studies by Richard Curle (1968), J. A. Palmer (1968), and Bruce Johnson (1971), bibliography by T. G. Ehrsam (1969).

Conrad, Michael Georg (mikh'äel gä'örk lön'rät), 1846-1927, German critic and novelist. With Karl Bleibtreu, he founded (1885) the journal *Gesellschaft* as a rallying point for German writers of the naturalistic school. Conrad espoused the cause of Zola with great enthusiasm. His works include a volume of criticism, *Madame Lutetia* (1883), and a naturalistic novel of Munich life, *Was die Isar rauscht* [What the Isar murmurs] (1887).

Conradin (kôn'radin), 1252-68, duke of Swabia, titular king of Jerusalem and Sicily, the last legitimate HOHENSTAUFEN, son of Holy Roman Emperor CONRAD IV. While Conradin was still a child in Germany, his uncle MANFRED made himself (1258) king of Sicily. When Manfred died the kingdom was seized (1266) by CHARLES I (Charles of Anjou). Young Conradin went to Italy in an attempt to recover his kingdom. Several cities rallied to his support, but he was defeated (1268) by Charles at Tagliacozzo. He was captured and executed at Naples.

Conrad of Marburg, d. 1233, German churchman. He was confessor (1225-31) of St. ELIZABETH of Hungary and administrator of her husband's benefices in his absence. His zeal against heresy earned him appointment (1231) as first papal inquisitor in Germany. His harshness made him much disliked, and he was murdered.

Conrad the Red, d. 955, duke of Lotharinga (Lorraine) (944-53). A Franconian adherent of the German king Otto I (later Holy Roman emperor), he was made duke of Lotharinga and married Otto's daughter Liutgard. He accompanied (951) his father-in-law to Italy against BERENGAR II. Remaining in Italy as Otto's representative, he concluded a peace treaty with the defeated Berengar Otto, however, considered the treaty too lenient and drastically revised it. The discontented Conrad then led a revolt against Otto with Otto's son, Ludolf, and Frederick, archbishop of Mainz. Expelled (953) from his duchy, Conrad allied (954) with the Hungarians, who were invading the empire. When the invasion united the people behind Otto, Conrad submitted. He fought with valor under Otto at the Lechfeld but was killed in the battle.

Conrad von Hotzendorf, Franz, Graf (fränts graf kôn'rät fän hö'tsändörf), 1852-1925, Austro-Hungarian field marshal. He served (1906-11, 1912-17) as chief of staff and led the Austro-Hungarian armies in World War I. After his dismissal in 1917 because of his opposition to the peace plans of Emperor Charles I, he held (1917-18) an Austro-Hungarian command on the Italian front. See his memoirs (5 vol., 1921-25).

Conroe (kôn'rō), city (1970 pop. 11,969), seat of Montgomery co., SE Texas, inc. 1885. Long a pine-lumbering town, it prospered after oil was discovered there in 1932. The Conroe oil field is now one of the major producing fields in the state. Other natural resources in the area are timber, clays, and gas. Farm products include beef and dairy cattle and feed for livestock and poultry.

Consalvi, Ercole (ärkö'lä kōnsäl'vë), 1757-1824, Italian cardinal and papal diplomat. In his first term (1800-1806) as secretary of state for Pope Pius VII he negotiated the CONCORDAT OF 1801 with Napoleon Bonaparte (later Emperor Napoleon I). Despite Con-

salvi's astute diplomacy, Napoleon annexed the papal states in 1809. Consalvi was compelled to go to Paris, where his refusal to attend Napoleon's second marriage (1809) resulted in exile at Reims. Reinstated as secretary of state after Napoleon's second abdication (1814), Consalvi vainly struggled against reactionary elements to reform the administration of the Papal States.

consanguinity (kōn'säng-gvīn'itē), state of being related by blood or descended from a common ancestor. This article focuses on legal usage of the term as it relates to the laws of marriage, descent, and inheritance, for its broader anthropological implications, see INCEST. Consanguinity is to be distinguished from affinity, which is the relation of a person, through marriage, to the consanguineous relatives of his spouse. Marriage between persons in lineal consanguinity (persons in the direct line of descent, such as father and daughter) and between brothers and sisters is void under common law, church law, and under statute. Whether or not marriages between persons of collateral consanguinity (those having a common ancestor but not related in direct line of descent) are prohibited as incestuous depends on statutory provision and judicial interpretation. In more than half the states of the United States, marriage between first cousins is prohibited by law, and the Roman Catholic Church and the Orthodox Eastern Church have strict rules on consanguinity as an impediment to marriage. Statutes in the United States discard affinal relationship as an impediment to marriage. Whether incestuous marriages are void or voidable in the United States depends on local statutes and their interpretation. In the law of descent and inheritance, the concept of consanguinity is most important in the area of intestate succession. Most states award the wife of a man who dies intestate a certain share of the estate, even though there exists neither lineal nor collateral consanguinity between the spouses. See G. B. L. Arner, *Consanguineous Marriages in the American Population* (1908, repr. 1969), B. D. Inglis, *Family Law* (2d ed., 2 vol., 1968-70).

Conscience, Hendrik (hën'drik kōnsēāns'), 1812-83, Flemish novelist, a founder of modern Flemish literature. His many historical novels were romantic but powerful, in the tradition of Scott, outstanding is *De Leuw van Vlaenderen* (1831, tr. *The Lion of Flanders*, 1885). In later years Conscience devoted his talents to moralistic social novels and idealized stories of Flemish village life. Among these are *The Poor Nobleman* (1851, tr. 1856) and *Ricke tickle tack* (1851, tr. 1856). His work enjoyed a great vogue in the United States in the late 1800s.

conscience, sense of moral awareness or of right and wrong. The concept has been variously explained by moralists and philosophers. In the history of ETHICS, the conscience has been looked upon as the will of a divine power expressing itself in man's judgments, an innate sense of right and wrong resulting from man's unity with the universe, an inherited intuitive sense evolved in the long history of the human race, and a set of values derived from the experience of the individual. Psychologists also differ in their analyses of the nature of conscience. It is variously believed to be an expression of values differing from other expressions of value only in the subject matter involved, a feeling of guilt for known or unknown actions done or not done, the manifestation of a special set of values introjected from the example and instruction of parents and teachers, and the value structure that essentially defines the personality of the individual. As a practical matter, the consciences of different people within a society or from different societies may vary widely.

conscientious objector, person who, on the grounds of conscience, resists the authority of the state to compel military service. Such resistance, emerging in time of war, may be based on membership in a pacifistic religious sect, such as the Society of Friends (Quakers), the Dukhobors, or Jehovah's Witnesses, or on personal religious or humanitarian convictions. Political opposition to the particular aim of conscription, such as that maintained by the Copperheads during the Civil War, by radical groups during World War I and, to a more limited extent, during World War II, and by large numbers during the Vietnam War, is usually considered in a separate category. The problem of conscientious objectors, although present in different forms since the beginning of the Christian era, became acute in World Wars I and II because of the urgent demands for manpower of the warring governments. The United States and Great Britain allowed members of recognized pacifistic religious groups to substitute

for combat service: (1) noncombatant military service, (2) nonmilitary activity related to the war effort, or (3) activity considered socially valuable. Pacifists without recognized claim to exemption were liable to harsher treatment, and about 5,000 conscientious objectors were imprisoned in the United States between 1940 and 1945. The postwar Selective Service Act, passed in 1948 and amended in 1951, required that conscientious objection be based on religious belief and training that included belief in a Supreme Being. In 1970 the Supreme Court removed the religious requirement and allowed objection based on a deeply held and coherent ethical system with no reference to a Supreme Being. In 1971 the Supreme Court refused to allow objection to a particular war, a decision affecting thousands of objectors to the Vietnam War. Some 50,000-100,000 men are estimated to have left the United States to avoid being drafted to serve in that war. See G. C. Field, *Pacifism and Conscientious Objection* (1945), M. Q. Sibley and P. E. Jacob, *Conscription of Conscience* (1952, repr. 1965), Lillian Schlissel, ed., *Conscience in America* (1968), G. C. Zahn, *War, Conscience, and Dissent* (1967), Michael Ferber and Staughton Lynd, *The Resistance* (1971).

consciousness, in psychology, a term commonly used to indicate a state of being aware of the environment. In Freudian psychology, conscious behavior largely includes cognitive processes of the ego, such as thinking, perception, and planning, as well as some aspects of the superego, such as conscience. Other activities, such as those stemming from primitive and instinctive needs, are under UNCONSCIOUS control. In this view, all behavior has an unconscious aspect. Some psychologists deny the distinction between conscious and unconscious behavior, others use the term consciousness to indicate all the activities of an individual that constitute the personality. See also DEFENSE MECHANISM, PSYCHOANALYSIS.

conscription, compulsory enrollment of personnel for service in the armed forces. Although obligatory service in the armed forces existed in ancient Greece and Rome and during the Middle Ages in Europe, conscription in the modern sense of the term dates from the French Revolution, when the idea was introduced that every able-bodied man in a nation was a potential soldier and that he could by means of conscription be made to serve in the armed forces, the militia of Greece and Rome, though compulsory, were organized at local levels for brief periods of time. Conscription enabled Napoleon to mold his tremendous fighting forces, and compulsory peacetime recruitment was introduced (1811-12) by Prussia. Mass armies, raised at little cost by conscription, led to the mass warfare of the Napoleonic Wars. The institution of conscription, which was increasingly justified by statesmen on grounds of national defense and economic stimulation, spread to other European nations in the 19th cent. In England compulsory military service was employed in the Anglo-Saxon fyrd as early as the 9th cent., this arrangement, however, was always at a local level and when the British Empire began expanding after the 16th cent., professional soldiers were relied upon. At the outbreak of World War I, Great Britain adopted conscription and used it again in World War II, it was abolished in 1962. Though little used in the United States prior to the Civil War, conscription was used by both sides in that war. Conscription, or the draft, was not used again until World War I (see SELECTIVE SERVICE). Peacetime conscription was introduced in 1940, and draftees fought in World War II, the Korean War, and the Vietnam War. During the Vietnam War conscription became a highly controversial issue, it was abolished by Congress in 1973. All major military powers of the 20th cent. have used conscription as a means of raising their armed forces. Conscription differs from IMPRESSMENT, which is the forcible mustering of recruits. Largely strongarm in technique, impressment preceded conscription historically and though for a time it was a means of enforcing conscription it has generally passed from use.

consecration* see ORDERS HOLY

consent, in law, active acquiescence or silent compliance by a person legally capable of consenting (see AGE OF CONSENT). It may be evidenced by words or acts or by silence when silence implies concurrence. Actual or implied consent is necessarily an element in every CONTRACT and every agreement. In criminal charges, the consent of the party injured (if not obtained by FRAUD or DURESS) is a defense for the accused, unless a third party or the state is injured.

conservation, in art see ART CONSERVATION AND RESTORATION

conservation laws, in physics, basic laws that together determine which processes can or cannot occur in nature, each law maintains that the total value of the quantity governed by that law, e.g., mass or energy, remains unchanged during physical processes. Conservation laws have the broadest possible application of all laws in physics and are thus considered by many scientists to be the most fundamental laws in nature. Most conservation laws are exact, or absolute, i.e., they apply to all possible processes, a few conservation laws are only partial, holding for some types of processes but not for others. By the beginning of the 20th cent. physics had established conservation laws governing the following quantities: energy, mass (or matter), linear MOMENTUM, angular momentum, and electric charge. When the theory of RELATIVITY showed (1905) that mass was a form of energy, the two laws governing these quantities were combined into a single law conserving the total of mass and energy. With the rapid development of the physics of ELEMENTARY PARTICLES during the 1950s, new conservation laws were discovered that have meaning only on this subatomic level. There are three absolute laws relating to the creation or annihilation of particles belonging to three different groups: the BARYON class of particles and the electron and muon families of particles in the LEPTON class. According to these conservation laws, particles of a given group cannot be created or destroyed except in pairs, where one of the pair is an ordinary particle and the other is an ANTIPARTICLE belonging to the same group. Two partial conservation laws that have been discovered for particles, governing the quantities known as strangeness and isotopic spin. Strangeness is conserved during the so-called strong interactions and the electromagnetic interactions, but not during the weak interactions associated with particle decay, isotopic spin is conserved only during the strong interactions. One very important discovery has been the link between conservation laws and basic symmetries in nature. For example, empty space possesses the symmetries that it is the same at every location (homogeneity) and in every direction (isotropy), these symmetries in turn lead to the invariance principles that the laws of physics should be the same regardless of changes of position or of orientation in space. The first invariance principle implies the law of conservation of linear momentum, while the second implies conservation of angular momentum. The symmetry known as the homogeneity of time leads to the invariance principle that the laws of physics remain the same at all times, which in turn implies the law of conservation of energy. The symmetries and invariance principles underlying the other conservation laws are more complex, and some are not yet understood. Three special conservation laws have been defined with respect to symmetries and invariance principles associated with inversion or reversal of space, time, and charge. Space inversion yields a mirror-image world where the "handedness" of particles and processes is reversed, the conserved quantity corresponding to this symmetry is called space parity, or simply PARITY, P . Similarly, the symmetries leading to invariance with respect to time reversal and charge conjugation (changing particles into their antiparticles) result in conservation of time parity, T , and charge parity, C . Although these three conservation laws do not hold individually for all possible processes, the combination of all three is thought to be an absolute conservation law, known as the CPT theorem, according to which if a given process occurs, then a corresponding process must also be possible in which particles are replaced by their antiparticles, the handedness of each particle is reversed, and the process proceeds in the opposite direction in time. It is expected that further research will discover more conservation laws and reveal their basis in fundamental symmetries of the physical world. Thus, conservation laws provide one of the keys to our understanding of the universe and its material basis. See K. W. Ford, *The World of Elementary Particles* (1963), I. J. Sakurai, *Invariance Principles and Elementary Particles* (1964), R. P. Feynman, *The Character of Physical Law* (1967), Martin Gardner, *The Ambidextrous Universe* (1967), *Right, and the Fall of Parity* (rev. ed. 1969), W. L. Scott, *History of Science Library: Conflict Between Atomism and Conservation Theory 1644-1860* (1970).

conservation of natural resources, the wise use of the earth's resources by man. The term conservation came into use in the late 19th cent. and referred

to the management, mainly for economic reasons, of such valuable natural resources as timber, fish, game, topsoil, pastureland, and minerals, and also to the preservation of forests (see FORESTRY), wildlife (see WILDLIFE REFUGE), parkland, WILDERNESS, and WATERSHED areas. In recent years the science of ECOLOGY has clarified the workings of the BIOSPHERE, i.e., the complex interrelationships among man, other animals, plants, and the physical environment. At the same time burgeoning population and industry and the ensuing POLLUTION have demonstrated how delicately balanced ecological relationships are and how easily they can be disrupted (see AIR POLLUTION, WATER POLLUTION, SOLID WASTE). Today, conservation of natural resources is embraced in the much broader conception of conserving the earth itself by protecting its capacity for self-renewal. Particularly complex are the problems of nonrenewable resources such as oil and coal (see ENERGY, SOURCES OF) and other minerals in great demand. Conservation practice was first included in U.S. government policy with the creation in 1871 of a U.S. commissioner of fish and FISHERIES. The Forestry Bureau of the Dept. of Agriculture created the first national forest reserve in 1891. The Irrigation Division in the U.S. Geological Survey developed into the Bureau of Reclamation. The Geological Survey has cataloged and classified the resources of the public domain. In 1906 an act protected the Alaskan fisheries. Conservation as part of a total approach to the use of natural resources was first introduced by President Theodore Roosevelt and his chief forester, Gifford Pinchot. They popularized the philosophy of conservation, inspired a widespread movement, and gave impetus to much legislation. In 1907, President Roosevelt appointed the Inland Waterways Commission, which emphasized the connection between forests, water supply, and stream flow. In 1909 he appointed the National Conservation Commission, which published the first inventory of the country's natural resources. Roosevelt in 1907 also began to withdraw large areas of Western public land from sale and settlement, so that their resources might be investigated, and he also set apart forest reserves, following the example of President Cleveland. Approximately one fifth of all standing timber is held by the government. Reclamation of eroded lands, begun in 1880, was aided by the Newlands Act of 1902, withdrawing areas of water supply from future settlement. In 1920 the development of water power on navigable streams was placed under the control of the Federal Power Commission. The National Park Service was created in 1916. In the 1930s the erosion of much arable land in the Midwest revealed the need for land reclamation and for conservation in general. The National Industrial Recovery Act of 1933 contained provisions for conservation. The Civilian Conservation Corps, founded in 1933 to relieve unemployment, furnished the personnel for many conservation projects. The Tennessee Valley Authority, set up in 1933, was an outstanding attempt to apply principles of conservation, soil reclamation, and electrification to an entire area. The New Deal era as a whole was outstanding for legislation on conservation. By 1960 the Soil Conservation Service, established in 1935, covered 95% of all farms and ranches in the United States. By the same year, under the Conservation Reserve Program, some 28 million acres of cropland had been returned to grass and forest cover. Throughout the 1950s attention was focused on the problem of conservation of water resources, particularly in the Southwest. In the 1960s pollution problems came to the fore in all industrialized countries. In the United States numerous laws were passed to protect the environment and its resources (see ENVIRONMENTALISM). In 1972 the United Nations held a conference on the human environment in Stockholm that drew up conservation principles for all nations. The UN Conference on the Law of the Sea, begun in 1974, will attempt to establish guidelines for conserving the food and mineral resources of the earth's oceans and the seabed. See Frank Graham, Jr., *Man's Dominion: The Story of Conservation in America* (1971), David W. Ehrenfeld, *Conserving Life on Earth* (1972).

conservation of wildlife, see WILDLIFE REFUGE, ENDANGERED SPECIES, CONSERVATION OF NATURAL RESOURCES

conservatism, in politics, the desire to maintain, or conserve, the existing order. Conservatives value highly the wisdom of the past and are generally opposed to widespread reform. Modern political conservatism emerged in the 19th cent. in reaction to the overwhelming political and social changes associated with the eras of the French Revolution and

the Industrial Revolution. By 1850 the term *conservatism*, probably first used by Chateaubriand, was generally used to define the politics of the RIGHT. The original tenets of European conservatism had already been formulated by Edmund BURKE, Joseph de MAISTRE, and others. They emphasized preserving the power of king and aristocracy, maintaining the influence of landholders against the rising industrial bourgeoisie, limiting suffrage, and continuing ties between CHURCH AND STATE. From the conservative view that social welfare was the responsibility of the privileged stemmed the passage of much humanitarian legislation, in which English conservatives usually led the way. In the late 19th cent. great conservative statesmen, notably Benjamin DISRAELI, exemplified the conservative tendency to resort to moderate reform in order to preserve the foundations of the established order. By the 20th cent. conservatism was being redirected by erstwhile liberal manufacturing and professional groups who had achieved many of their political aims and had become more concerned with preserving them from attack by groups not so favored by the political and social system. The new conservatism lost its predominantly agrarian and semifeudal bias, and accepted democratic suffrage, advocated economic LAISSEZ FAIRE, and opposed extension of the welfare state. This form of conservatism is best seen in highly industrialized nations, where it has been flexible and receptive to moderate change. Conservatism should therefore be distinguished both from a reactionary desire for a past age and the radical right-wing ideology of FASCISM and National Socialism. See Peter Viereck, *Conservatism: From John Adams to Churchill* (1956), Russell Kirk, *The Conservative Mind* (rev. ed. 1960), C. L. Rossiter, *Conservatism in America* (2d ed. 1962).

Conservative party, British political party. The Conservatives are a continuation of the historic TORY party. The name was used by George Canning as early as 1824 and was first popularized by John Wilson Croker in the *Quarterly Review* in 1830. The REFORM BILL of 1832, which created some 500,000 new middle-class voters, marked the advent of the new party. The 19th-century Conservatives, like their Tory predecessors, were defenders of the established Church of England. They supported aristocratic government and a narrow franchise. They attempted, by passing factory acts and moderating the poor law of 1834, to ease hardships stemming from the Industrial Revolution, but they had no comprehensive plan to cope with its widespread dislocations. They were stronger in rural than in urban areas and were defenders of agricultural interests. Sir Robert PEELE, in his *Tamworth Manifesto* (1834) and after, attempted to make the party attractive to the new business classes. But his repeal (1846) of the CORN LAWS brought about an angry reaction from protectionist agricultural interests, led by Lord George Bentinck and Benjamin DISRAELI, and resulted in a party split. The "Peelites" eventually merged with the LIBERAL PARTY, and the Conservatives were hampered by the loss to the Liberals of able young leaders like William Gladstone. In the heyday (1846-73) of free trade and anti-imperial sentiment, the Conservatives were out of office, except for three brief ministries, until the Disraeli government of 1874-80. Disraeli's strong imperialism and his wooing of a broadened electorate with plans for reform, a program known as "Tory democracy," was attractive in a period of depression and increasing imperial competition. After the Reform Bill of 1884 campaign organizations like the Primrose League and the development of the caucus gave the Conservatives greater solidarity and cohesion. They gained additional strength as a result of the secession (1886) from the Liberal party of the Liberal Unionists, who, like the Conservatives, opposed HOME RULE for Ireland. (In 1912 the Liberal Unionists formally merged with the Conservative party.) The party was in office under the 3d marquess of SALISBURY (1886-92, 1895-1902) and Arthur BALFOUR (1902-5). Efforts by Lord Randolph CHURCHILL to implement further domestic reforms in the tradition of Tory democracy were unsuccessful under Salisbury's leadership, but the popular imperialistic emphasis remained. In this period the party was gradually drawing closer to middle-class business interests, but the insistence of Joseph CHAMBERLAIN on a program of tariff reform, including imperial preference, split the party and resulted (1906) in failure at the polls. Conservatives were next in office as part of the coalition government during World War I.

The Modern Conservative Party. In 1922 the Conservatives refused to continue the coalition, and under

Andrew Bonar LAW they emerged victorious at the polls. With the Liberals in decline and the LABOUR PARTY still developing, the Conservatives entered a period of almost continuous hegemony. They held office from 1922 to 1929, interrupted only by a brief Labour ministry in 1924. They were the dominant power in the National governments of Ramsay MACDONALD (1931-35), Stanley BALDWIN (1935-37), and Neville CHAMBERLAIN (1937-40). Under the long leadership of Baldwin (1922-37), the party spoke for the interests of business, the aristocracy, the professional and white-collar classes, and farmers. They lost prestige by the failure of the appeasement policy of Chamberlain toward Nazi Germany, but the country rallied to his successor, Sir Winston CHURCHILL. Triumph in war preceded electoral defeat (1945), owing to popular demand for urgently needed social reform, which the Conservatives would not carry through. Returning to office (1951) under Churchill, the Conservatives displayed a sense of pragmatic modernity in accepting many of the social reforms instituted by the Labour government. The party's majority in the House of Commons was increased in 1955, and Sir Anthony EDEN became (1955) prime minister upon Churchill's retirement. Popularity diminished temporarily during the SUEZ CANAL crisis, but favorable economic conditions and the political skill of Harold MACMILLAN, who headed the government after Eden's retirement (1957), resulted in a solid electoral victory in 1959. Under the leadership of Sir Alec DOUGLAS-HOME, who succeeded Macmillan (1963), the party lost narrowly to the Labour party in 1964, and then, with Edward HEATH as leader, it lost again in 1966. Returning to power in 1970, Heath and the Conservatives faced the problems of a stagnant economy and a declining international political position. The party, in response, moved to curb the power of trade unions and encouraged more economic self-reliance. In foreign affairs, it continued the policy of restricting Great Britain's Commonwealth and international roles while expanding ties with Western Europe, as demonstrated by Britain's entry (1973) into the European Common Market. In Feb., 1974, in the middle of a severe economic crisis and a confrontation with striking coal miners, whose wage demands the government considered inflationary, Heath called a general election, in which the Conservatives lost their majority in the House of Commons. Since Labour did not win a majority either (although it secured more seats), Heath at first sought to remain in office by forming a coalition government with the Liberals. The Liberals, however, refused to participate in such a government, thus forcing Heath's resignation. The Conservatives lost again in the election of Oct., 1974. See studies by Arthur Bryant (1929) and R. B. McDowell (1959), R. T. McKenzie, *British Political Parties* (2d ed. 1963), J. D. Hoffman, *The Conservative Party in Opposition, 1945-51* (1964), E. J. Feuchtwanger, *Disraeli, Democracy and the Tory Party* (1968), Robert Blake, *The Conservative Party from Peel to Churchill* (1970).

Consett, urban district (1971 pop. 35,391), Durham, NE England. There are coal mines, iron and steel plants, and nurseries in Consett. The district has associations with the Roman, Saxon, and Norman conquests. A German colony of swordmakers settled in Consett in the 17th cent.

Conshohocken (kōn'shahōk'an), industrial borough (1970 pop. 10,195), Montgomery co., SE Pa., on the Schuylkill River, in a fertile farm area that also has clay pits, inc. 1850.

Considérant, Victor Prosper (vēktōr' prōspār' kōnsédārān'), 1808-93, French socialist, follower of Charles FOURIER. In 1837, at the death of Fourier, he became the acknowledged leader of Fourierism. He edited Fourierist newspapers, including the *Philantropie* and the *Phalange*, and published works on the subject, notably a digest of Fourier's writings, *Destinée sociale* (2d ed. 1847-49). As a member of the national assembly, he took part in the JUNE DAYS insurrection (1848) and was forced to leave Paris and live in Belgium. At the request of Albert Brisbane, Considérant tried unsuccessfully to establish (1855-57) a Fourierist colony in Texas. His several books include *Principes du socialisme* (1847), an argument favoring Fourierism over other kinds of socialism. See biography by Maurice Dommanget (1929).

consideration, in law see CONTRACT

consols, contraction of consolidated annuities, a bond issue designed to consolidate two or more outstanding issues, used in reference to British government stock. Public borrowing began in England with the establishment of the Bank of England and the national debt (1693-94), and the growth of the

debt produced a confusing variety of stocks. Prime minister Henry Pelham began to consolidate existing stocks in 1751. The consolidated stocks had a fixed rate of interest, or annuity, payable by the Bank of England, with premiums to be paid if the market conditions justified such payments. Consols bore no maturity date and were redeemable on call by the government. During the late 19th and early 20th cent., consols constituted the major part of the national debt and were thus a reliable index to the state of national credit.

conspiracy, in law, agreement of two or more persons to commit a criminal or otherwise unlawful act. At COMMON LAW, the crime of conspiracy was committed with the making of the agreement, but present-day statutes require an overt step by a conspirator to further the conspiracy. It is not necessary for guilt that the act be fully consummated. Many acts that would not be criminal if accomplished by an individual alone may nevertheless be the object of a conspiracy. With the rise of the labor movement in the 19th cent., British and American courts used this against unions; courts held that while an individual employee might lawfully abstain from work, the concerted stoppage of a group of employees, as in a strike, might be criminal. In 1875, Britain passed a law exempting unions from prosecution for conspiracy, and in 1932 the U.S. Congress passed a law that limited the power of Federal courts to restrain union activity. Other controversial aspects of conspiracy laws include the modification of the rules of EVIDENCE and the potential for a dragnet. A statement of a conspirator in furtherance of the conspiracy is admissible against all conspirators, even if the statement includes damaging references to another conspirator, and often even if it violates the rules against hearsay evidence. The conspiracy can be proved by circumstantial evidence. Any conspirator is guilty of any substantive crime committed by any other conspirator in furtherance of the enterprise. It is a Federal crime to conspire to commit any activity prohibited by Federal statute, whether or not Congress imposed criminal sanctions on the activity itself. An individual injured by a conspiracy may sue the conspirators to recover damages. See P. W. Winfield, *The History of Conspiracy and Abuse of Legal Procedure* (1921), Milton Handler, *Contract, Combination or Conspiracy* (1953).

Constable, Henry, 1562-1613, English poet. After graduating from Cambridge in 1580 he went to Paris, where the atmosphere was more congenial for one of Roman Catholic faith. There he wrote *Diana* (1592), a volume of sonnets. In addition he was the author of four pastorals that appeared in *England's Helicon* (1600) and *Spiritual Sonnets* (1815). Constable's work is considered to have had an important influence on the development of the sonnet.

Constable, John, 1776-1837, English painter, b. Suffolk. Constable and Turner were the leading figures in English landscape painting of the 19th cent. Constable became famous for his landscapes of Suffolk, Hampstead, Salisbury, and Brighton. The son of a prosperous miller, he showed artistic talent while very young but did not devote himself to art until he was 23, when he went to London to study at the Royal Academy. Influenced by the 17th-century landscape painters Ruisdael and Claude Lorrain, his poetic approach to nature paralleled in spirit that of his contemporary, the poet Wordsworth. Constable's direct observations of nature and his free use of broken color were extraordinary in his day. He received but modest recognition in England, being tardily admitted to the Royal Academy in 1829. His work was more popular in France. In 1824, his *View on the Stour* (1819) and *The Hay Wain* (1821, National Gall., London) were exhibited at the Salon in Paris, winning gold medals. His work made a profound impression on the French romantics including the young Delacroix and Bonington. Later his painting affected the Barbizon school and, more indirectly, the general course of French 19th-century landscape art. Today he is especially admired for the spontaneous, vigorous, and very complete sketches made as preparatory exercises for large paintings (e.g., *Weymouth Bay*, National Gall., London). In the United States he is represented in the Metropolitan Museum and the Frick Collection, New York City, and in the galleries of Philadelphia, Toledo, and Chicago. Splendid examples of his work are contained in the National Gallery, London and the Victoria and Albert Museum. See catalogue of the latter collection by Graham Reynolds (1960), C. R. Leslie, *Memoirs of the Life of John Constable* (enl. ed. 1937), collections of his letters by P. Holmes (1931) and R. B. Beckett (1962), biography by Basil

Taylor (1973), studies by Sir C. J. Holmes (1902) and Carlos Peacock (rev. ed. 1972).

Constance, 1154-98, Holy Roman empress, wife of Holy Roman Emperor HENRY VI, daughter of King Roger II of Sicily. She was named heiress of Sicily by her nephew King William II. On his death, however (1189), the Sicilian nobles, wishing to prevent German rule in Sicily, chose Constance's nephew TANCRED of Lecce as William's successor. Henry VI conducted an unsuccessful campaign (1191) against Tancred during which Constance was captured but soon released. After Tancred's death (1194) Henry was crowned king of Sicily. When he died (1197) all of Italy revolted against German rule. In order to save the throne of Sicily for her infant son Frederick (later Holy Roman emperor as FREDERICK II), Constance renounced the German kingship for Frederick and had him crowned (1198) king of Sicily. She was regent for her son, before her death she named Pope Innocent III his guardian.

Constance, Ger. *Konstanz*, city (1970 pop. 61,160), Baden-Württemberg, 5 West Germany, on the Rhine River at the western end of the Lake of Constance (Bodensee), and near the Swiss border. Its manufactures include textiles, chemicals, and electrical equipment. The city is also a tourist center. Constance was founded as a Roman fort in the 4th cent. A.D. and became an episcopal see at the end of the 6th cent. The bishops became powerful and held large territories, including much of Baden-Württemberg and Switzerland, as princes of the Holy Roman Empire. In Constance in 1183, Emperor Frederick I recognized the LOMBARD LEAGUE. Located on a trade route between Germany and Italy, Constance became a free imperial city in 1192. During the Council of Constance (1414-18), John Huss was burned at the stake. In 1531 the city, which had accepted the Reformation, joined the Schmalkaldic League. Emperor Charles V, after defeating the League, deprived Constance of its free imperial status and gave it to his brother, later Emperor Ferdinand I. Constance was in Austrian hands from 1548 until it was ceded (1805) to Baden. The bishopric was suppressed in 1821, and the diocese was abolished in 1827. Among the numerous historic buildings in Constance are the cathedral (11th cent., additions 15th and 17th cent.), the Council building (1388), and a former Dominican convent (now a hotel), the birthplace (1838) of Graf von Zeppelin, the soldier and aviator. Constance is the seat of a university.

Constance, Council of, 1414-18, council of the Roman Catholic Church, some of its sessions being reckoned as the 16th ecumenical council. It was summoned to end the Great Schism (see SCHISM, GREAT) in which three men were claiming to be pope—GREGORY XII (since recognized as canonical pope), John XXIII (see COSSA, BALDASSARRE), and Benedict XIII (see LUNA, PEDRO DE). Reform of Christian life and extirpation of heresy were also aims of the convocation, which was called by John at the insistence of Holy Roman Emperor SIGISMUND. Sigismund chose Constance, an imperial city, as the meeting place. During the council enormous crowds visited the city, there was much pageantry. The first session was in Nov., 1414, the 45th and last was on April 22, 1418. The council was dominated by theologians, especially French, who held the conciliar theory (i.e., that councils held supreme power in the church and that even the pope was subject to their edicts) that had appeared at the Council of Pisa (see PISA, COUNCIL OF). Instead of the traditional assembly of bishops, the council was organized as a convention of nations (German, Italian, French, and English, the Spanish entered later), each nation having one vote. The decisions were made in caucuses of the nations between sessions. The convention declared in the Articles of Constance (April 6, 1415) that it was an ecumenical council and supreme in the church. Next it declared John deposed (May 29, 1415). Gregory XII, meanwhile, sent legates with a formal decree to convene a council, this was accepted by the convention, which then ceremonially declared the council convened, at the same time Gregory resigned the papacy (July 4, 1415). Benedict provided a hard problem, he would abdicate only if allowed to name his successor. At last, after a trial held in his absence, he was deposed (July 26, 1417). This ended the schism. An elaborate method of electing the new pope was adopted, and the conclave soon agreed on MARTIN V (Nov. 11, 1417). The council, however, had already provided a plan to perpetuate its rule over the church by calling for frequent councils, furthermore, the modest reforms enacted by the council seemed designed to limit the pope's power of taxation and to protect the interests of the national clergy. Martin agreed to all

enactments of the council—except, Catholic theologians argue, the council's extreme claim to supremacy—and signed concordats embodying these reforms with Germany, England, and the Latin countries. John Huss and Jerome of Prague were tried and burned at the stake for heresy. St. Bridget of Sweden was canonized. The conciliarists John Gerson and Pierre d'Ailly were among the figures prominent at the council. Church theologians tend to regard as ecumenical in character only those sessions of the council meeting after the convocation by Gregory XII, or the sessions following the election of Martin V. See E. F. Jacob, *Essays in the Conciliar Epoch* (rev. ed. 1963); Brian Tierney, *Foundations of Conciliar Theory* (1955); L. R. Loomis, *The Council of Constance* (1961).

Constance, Lake of, Ger. Bodensee, lake, 208 sq mi (539 sq km), bordering on Switzerland, West Germany, and Austria. It is 42 mi (68 km) long and has a maximum depth of 827 ft (252 m). The lake is fed and drained by the Rhine River and divides near the city of Constance into two arms, Untersee and Überlinger See. The main body of the lake is called the Obersee. Fruit is grown on the lake's fertile shores, and wine making and fishing are major industries. The chief towns and cities of the lake are Constance, Friedrichshafen, and Lindau, all in West Germany; Bregenz in Austria; and Rorschach in Switzerland. Remains of lake dwellings have been found.

Constans I (kōn'stānz), b. 320 or 323, d. 350, Roman emperor, youngest son of Constantine I. At his father's death in 337 he received Italy and Africa as well as Pannonia and Dacia, while his brothers, Constantine II and Constantius II, received other portions of the empire. Trouble arose among them, and in 340 Constantine invaded Italy to win some of Constans' territory. Constantine was, however, killed in an ambush, and Constans was left to rule until his extortionist and infamous conduct led to his assassination 10 years later.

Constans II (Constans Pogonatus), 630-68, Byzantine emperor (641-68), son and successor of Constantine III and grandson of Heraclius I. Early in his reign Armenia and Asia Minor were invaded by the Muslims, who challenged Byzantine supremacy at sea, took Cyprus, and threatened Sicily and Constantinople. An able and vigorous ruler, he sought to end the religious controversy centering about MONOTHEISM by issuing a decree (648) forbidding its discussion. This involved him in conflict with Pope MARTIN I, whom he finally had arrested and banished. Constans campaigned (658) in the Balkans against the Slavs, and in 662 he moved to Italy, with the purpose of establishing his capital at Rome, but fought with little result against the Lombards and finally settled (663) at Syracuse. From there he directed a successful resistance to the Muslims. Constans extended the administrative reorganization of the empire begun by HERACLIUS. Assassinated, he was succeeded by his son, Constantine IV.

Constant, Benjamin (Henri Benjamin Constant de Rebecque) (aNRē' baNzhamaN' kōNstaN' də rabēk'), 1767-1830, French-Swiss political writer and novelist, b. Lausanne. His affair (1794-1811) with Germaine de Staël turned him to political interests. He accompanied her to Paris in 1795 and served (1799-1801) as a tribune under the first consul, Napoleon. When Mme de Staël was expelled (1802), however, he went into exile with her, spending the following 12 years in Switzerland and Germany. In 1813 he published a pamphlet attacking Napoleon and urging constitutional government and civil liberties. On Napoleon's return from Elba, however, Constant accepted office under him. After Napoleon's final defeat at Waterloo and the restoration of the Bourbons, Constant continued his political pamphleteering, calling for a constitutional monarchy. He served (1819-22, 1824-30) in the chamber of deputies. Constant gained a great reputation as a liberal publicist, and his funeral (shortly after the July Revolution, 1830, which he had supported) was the occasion for great demonstrations. His most important work, the introspective and semi-autobiographical novel, *Adolphe* (1816, tr. 1959), is highly regarded for its style. Parts of his correspondence and journals have been published, the latter as *Le Journal intime* (1887-89) and *Le Cahier rouge* [the red notebook] (1907). The discovery of an unfinished novel, *Cécile* (1951, tr. 1953), has contributed to a new appreciation of Constant's literary merit. See studies by E. W. Schermerhorn (1924, repr. 1970), Harold Nicolson (1949), and W. W. Holdheim (1961).

Constant, Paul Henri Benjamin, baron d'Estournelles de, see ESTOURNELLES DE CONSTANT

Constanța (kōnstan'tsa), city (1970 est. pop. 172,000), SE Rumania, on the Black Sea. It is the administrative center of DOBRUJA and a major railroad junction and industrial city, but its chief importance derives from its role as Rumania's main seaport. Petroleum (brought by pipeline from the Ploiești oil fields), grain, and lumber are the leading exports. Besides handling general overseas trade, Constanța is important in the transit traffic with Hungary and Czechoslovakia. It also serves as Rumania's major naval and air base and as a seaside resort. The city was founded in the 7th cent. B.C. as the Greek colony of Tomi and came under Roman rule in 72 B.C. Ovid lived in exile there. Constantine I (4th cent. A.D.) named the city Constantiniana and made it an episcopal see. It was captured by the Turks in 1413. Rumania acquired it in 1878. There are several synagogues and mosques, an Orthodox cathedral, and a statue of Ovid, as well as many Roman and Byzantine remains. The regional archaeological museum and the marine biology station are also of interest.

Constant de Rebecque, Henri Benjamin: see CONSTANT, BENJAMIN

Constantine I or Constantine the Great (kōn'stāntēn, -tīn), 288?-337, Roman emperor, b. Naissus (present-day Nis, Yugoslavia). He was the son of CONSTANTIUS I and St. HELENA and was named in full Flavius Valerius Constantinus. When his father was made caesar (subemperor), Constantine was left at the court of the emperor DIOCLETIAN, where he was under the watchful eye of GALERIUS, who was caesar with Constantius. When Diocletian and MAXIMIAN resigned in 305, Constantius and Galerius became emperors. Constantius requested that Constantine be sent to him in Britain, and Galerius reluctantly complied. Constantius died at York the next year. There, his soldiers proclaimed Constantine emperor, but much rivalry for the vacated office ensued. In Italy, MAXENTIUS, supported by the Romans and by his father Maximian, vied with SEVERUS and Galerius Constantine, accepting the lesser title of caesar from Galerius, remained aloof while Maxentius and Maximian defeated Severus and Galerius. Constantine made an alliance with Maximian, marrying Maximian's daughter Fausta and recognizing Maxentius after a fashion. When Maximian, in dispute with his son, fled to Constantine, Constantine received and sheltered him until Maximian, in an attempt to regain the throne, undertook (310) a revolt against Constantine's rule in Gaul. Unsuccessful against Constantine, Maximian was forced to commit suicide. Constantine, having already declared against Maxentius and ignoring the fact that Galerius had recognized LICINIUS in the East, now considered himself emperor. When Galerius died in 310, still another claimant to the imperial throne appeared in MAXIMIN (d. 313), who allied himself with Maxentius against the alliance of Licinius and Constantine. While Licinius attacked Maximin, Constantine moved into Italy against Maxentius. The rivals for Italy met (312) at the Milvian or Mulvian Bridge over the Tiber near Rome. Before the battle Constantine, who was already sympathetic toward Christianity, is said by Eusebius of Caesarea to have seen in the sky a flaming cross inscribed with the words, "In this sign thou shalt conquer." He adopted the cross and was victorious. Maxentius was routed and killed. The battle is regarded as a turning point for Christianity. In 313 Constantine and his fellow emperor, Licinius, met at Milan and there issued the so-called Edict of Milan, confirming Galerius' edict of 309, which stated that Christianity would be tolerated throughout the empire. The edict in effect made Christianity a lawful religion, although it did not, as is sometimes believed, make Christianity the official state religion. No longer having Maximin to contend with, Licinius challenged Constantine, and a brief struggle followed. Constantine, victorious, took (315) control over Greece and the Balkans, and the uneasy peace that followed lasted until 324, when Licinius again vied with Constantine. This time Licinius lost his throne and ultimately his life. Constantine was now sole ruler of the empire, and in a reign of peace he set about rebuilding the strength of old Rome. Constantine continued to tolerate paganism and even to encourage the imperial cult. At the same time, however, he endeavored to unify and strengthen Christianity. In 314 he convened a synod at Arles to regulate the Church in the West, and in 325 he convened and presided over a council at Nicaea to deal with the troubles over Arianism (see NICAEA FIRST COUNCIL OF). Thus Constantine evolved the idea of the ecumenical COUNCIL. In 330 he moved the capital to Byzantium, which was rebuilt as CONSTANTINOPE, a city predominantly Chris-

tian and dedicated to the Virgin. He seems to have favored compromise with Arianism, and in 335, in defiance of the Council of Tyre, he exiled St. ATHANASIUS. As the founder of the Christian empire, Constantine began a new era. He was an absolute ruler, and his reign saw the culmination of the tendency toward despotic rule, centralized bureaucracy, and separation of military and civil powers evolved by Diocletian. Constantine's legal reforms were marked by great humanity, perhaps a result of Christian influence. Though he had done much to unify the empire, at his death Constantine divided it again, providing for his three surviving sons and also to some extent for the sons of his half brother. These nephews were soon killed (though others, notably Julian the Apostate, survived), but complex contests ensued between Constans I, Constantine II, and Constantius II. Historians differ greatly in their assessments of Constantine's motives and the depth of his Christian conviction. Early Christian writers portray him as a devout convert, although they have difficulty explaining his execution in 320 (on adultery charges) of Crispus, his son by his first wife, and FAUSTA, his wife. Some later historians see him as a political genius, expeditiously using Christianity to unify his empire. An intermediate interpretation pictures him as a pagan gradually converted to Christianity (he was baptized on his deathbed), using his new belief for personal ends much as earlier emperors had used the imperial cult. The chief contemporary historians of Constantine's reign are Lactantius and Eusebius. See biographies by Norman H. Baynes (1931, repr. 1972), L. B. Holsapple (1942), A. H. M. Jones (rev. ed. 1962), John Holland Smith (1971), and F. G. Slaughter (1972); C. B. Coleman, *Constantine the Great and Christianity* (1914); G. P. Baker, *Constantine the Great and the Christian Revolution* (1930, repr. 1967).

Constantine II, 316-40, Roman emperor, son of Constantine I. When the empire was divided at the death (337) of Constantine I, among the brothers Constantius II, Constans I, and Constantine II, Constantine II received Britain, Gaul, and Spain. Maintaining that he had been cheated, he demanded some of the territory given Constans I. In an invasion of Italy intended to win some of that territory, he was killed in an ambush.

Constantine IV, c. 652-685, Byzantine emperor (668-85), son and successor of Constans II. He defended Constantinople against the annual naval attacks of the Muslims, who finally withdrew in 678. GREEK FIRE was a conspicuous weapon in the defense. Severely defeated (679) by the Bulgars, Constantine ceded them territory S of the Danube, where they founded a kingdom. In 680 he summoned the Third Council of Constantinople, which briefly reestablished peace between the Eastern and Western churches by condemning MONOTHEISM. Constantine was succeeded by his son, Justinian II.

Constantine V (Constantine Copronymus), 718-75, Byzantine emperor (741-75), son and successor of LEO III. An able general and administrator, he fought successfully against the Arabs, Slavs, and Bulgars, improved the water supply of Constantinople, forcibly resettled the city after a great plague, and continued his father's financial and religious policies. In 754 he summoned a synod at Constantinople, which sustained ICONOCLASM. He rigidly enforced a decree forbidding the use of images in worship, and he opposed monasticism. A serious result of this policy was the loss of Rome and, ultimately, of Italy to the Byzantines. Pope Zacharias broke with Constantine, and Pope Stephen II placed Rome under the protection of PEPIN THE SHORT. Constantine was succeeded by his son Leo IV.

Constantine VI, b. c. 770, Byzantine emperor (780-97), son and successor of LEO IV. His mother, IRENE, was regent until 790, when she was deposed by a military revolt. Constantine recalled her in 792 and made her joint ruler. His subsequent acts of cruelty and his divorce and immediate remarriage (795) alienated his supporters. In 797, Irene deposed her son, had him blinded, and assumed the imperial title. Constantine died in obscurity during the reign (820-29) of Michael II. In his minority the Second Council of Nicaea, which restored icon veneration, took place (787). Constantine fought indecisively against the Bulgarians and the Arabs.

Constantine VII (Constantine Porphyrogenitus), 905-59, Byzantine emperor (913-59). He acceded after the brief reign of his uncle Alexander, who succeeded Constantine's father, LEO VI. A regency (913-20) was followed by the rule (920-44) of the usurper ROMANUS I. In 945, Constantine expelled the sons of Romanus and began his personal rule. His main in-

terests lay in legal reforms, in the fair redistribution of land among the peasants, and in the encouragement of art and learning. He was succeeded by his son, Romanus II. See study by Arnold Toynbee (1973).

Constantine XI (Constantine Palaeologus), d. 1453, last Byzantine emperor (1449–53), brother and successor of John VIII. To secure Western aid against the Turkish assault on what remained of the empire, he proclaimed (1452) the union of the Western and Eastern Churches. No help came, however, and in 1453 Constantine, with some 8,000 Greeks, Venetians, and Genoese, faced 150,000 Turkish besiegers under Sultan Muhammad II. After almost two months of heroic defense, directed by the emperor, the city and the empire fell. Constantine died fighting with the last of his men.

Constantine I, 1868–1923, king of the Hellenes, eldest son of George I, whom he succeeded in 1913. Married to Sophia, sister of the German emperor William II, he opposed the pro-Allied policy of the Greek premier, Eleutherios VENIZELOS, and was forced to abdicate in 1917 under Allied military pressure. His second son, ALEXANDER, succeeded to the throne. Recalled (1920) on Alexander's death, he continued the war against Turkey, although the Allies withdrew their support from Greece. The Turkish victory at Izmir caused a military rebellion, and Constantine in 1922 was again deposed and exiled. His eldest son, George II, succeeded. Constantine is also known as Constantine XII.

Constantine II, 1940–, king of the Hellenes, also known as Constantine XIII. He was appointed regent in 1964 and succeeded to the throne the same year on the death of his father, King Paul I. In 1967, after a military junta had seized political power in Greece, Constantine made an abortive attempt to overthrow the generals. When the coup failed, he and his family fled into exile. The junta declared him formally deposed in June, 1973, and established a republic. In Dec., 1974, after the overthrow of the junta, the Greek voters chose not to restore the monarchy.

Constantine (Konstantin Pavlovich) (kənstāntyēn' pāv'levich), 1779–1831, Russian grand duke, second son of Czar Paul I and brother of Alexander I and Nicholas I. On the death of Alexander I (1825), Constantine was next in line for succession to the throne. However, in 1822 he had secretly renounced his claim in favor of Nicholas in return for Alexander's permission to divorce his first wife and marry a Polish countess. The arrangement was not made public and some confusion resulted concerning the succession. A group known as the DECEMBRISTS took advantage of the situation and attempted to seize power under the slogan "Constantine and Constitution." Nicholas quelled the uprising. During the entire episode Constantine remained in Poland, where he had been commander in chief and virtual governor since 1815. The severity of his administration there led to the Polish uprising of 1830. Constantine died before the rebellion was suppressed.

Constantine, d. 411, Roman general. He was proclaimed emperor by the Roman troops in Britain in 407 and led a revolt in Gaul and Spain against the Western emperor Honorius. He conquered part of Gaul and, through his son Constans, took Spain. Constantine forced recognition from Honorius as joint emperor, but his triumph was short. The counter-revolt of GERONTIUS halted him, and he was defeated by Honorius' general Constantius (later Emperor CONSTANTINUS III). Constantine was beheaded. His withdrawal of Roman troops from Britain had greatly weakened the Roman hold on that island.

Constantine, Learie (kōn'stāntīn'), 1902–71, West Indian cricket player and the first black man to sit in the British House of Lords, b. Trinidad. The son of a sugar plantation foreman, he became world famous as a cricket player in the 1920s and 30s. He settled in England (1929), and after World War II studied law and was called to the bar. Returning to Trinidad, he began a career in public service, first as minister of works and transport and then as Trinidad's high commissioner in London (1962–64). He was knighted in 1962 and raised to the peerage in 1969.

Constantine (kōn'stāntēn), ancient Cirta, city (1966 pop. 253,649), capital of Constantine dept., NE Algeria, on the gorge of the Rhumel River. A major inland city, it is the railhead of a prosperous and diverse agricultural area. Constantine is also a center of the grain trade and has flour mills, a tractor factory, and industries producing textiles and leather goods. Products made by local artisans are economically important. Founded by Carthaginians (who called it Sarim Batim), Constantine became

the capital and commercial center of Numidia and was named Cirta [the city]. Under Roman rule it was a major grain-shipping point and one of the wealthiest cities of Africa. Destroyed (A.D. 311) during the war preceding the accession of Constantine I, it was rebuilt by Constantine himself and renamed in his honor. The city was pillaged by the Vandals in the 5th cent. and later became an object of contention among various Muslim dynasties. The Turks captured it in the 16th cent. and made it a provincial capital. By the time of the French conquest in 1837 the district governor of Constantine had become virtually independent of the Ottoman Empire. Modern Constantine is the seat of a Roman Catholic bishop, a university, and a Muslim school of higher education.

Constantine, Donation of, Lat. *Donatio Constantini*, also called the *Constitutum Constantini*, forged document, probably drafted in the 8th cent. It purported to be a grant by Roman Emperor Constantine I of great temporal power in Italy and the West to the PAPACY. Its purpose was apparently to enhance papal territorial claims in Italy by giving them greater antiquity. The document also recognized the spiritual authority of the popes, but this statement had no weight, since at no time was it argued in the Roman Catholic Church that spiritual authority could emanate from the emperor. It was not, as a matter of fact, ever of great practical value, nor was it, as is sometimes asserted, universally accepted in the Middle Ages. It owes its great fame to the fact that the scholar Lorenzo VALLA demonstrated the falsity of the document by critical methods that became the model for later textual criticism and are said by some to be the beginning of modern textual criticism. See Lorenzo Valla, *Treatise on the Donation of Constantine* (tr. by C. B. Coleman, 1922, repr. 1971).

Constantine Nikolayevich (nēkōlāyá'vich), 1827–92, grand duke of Russia, brother of Czar Alexander II. Constantine supported all the reforms instituted by his brother, who gave him command of the fleet and made him governor general of Poland in 1862. There his conciliatory policy could not prevent the insurrection of 1863 against Russian rule. He resigned and in 1865 was appointed president of the state council. He retired from state service in 1881.

Constantine the Great: see CONSTANTINE I, Roman emperor.

Constantinople, former capital of the BYZANTINE EMPIRE and of the OTTOMAN EMPIRE, since 1930 officially called Istanbul (for location and description, see ISTANBUL). It was founded (A.D. 330) at ancient BYZANTIUM as the new capital of the Roman Empire by Constantine I, after whom it was named. The largest and most splendid European city of the Middle Ages, Constantinople shared the glories and vicissitudes of the Byzantine Empire, which in the end was reduced to the city and its environs. Although besieged innumerable times by various peoples, it was taken only three times—in 1204 by the army of the Fourth Crusade (see CRUSADES), in 1261 by Michael VIII, and in 1453 by the Ottoman Sultan Muhammad II. Defended by GREEK FIRE, it was also well fortified. An early inner wall was erected by Constantine I, and the enlarged Constantinople was surrounded by a triple wall of fortifications, begun (5th cent.) by Theodosius II. Built on seven hills, the city on the Bosphorus presented the appearance of an impregnable fortress enclosing a sea of magnificent palaces and gilded domes and towers. In the 10th cent., it had a cosmopolitan population of about 1 million. The Church of HAGIA SOPHIA, the sacred palace of the emperors (a city in itself), the huge hippodrome, center of the popular life, and the Golden Gate, the chief entrance into the city, were among the largest of the scores of churches, public edifices, and monuments that lined the broad arcaded avenues and squares. Constantinople had a great wealth of artistic and literary treasures before it was sacked in 1204 and 1453. Virtually depopulated when it fell to the Ottoman Turks, the city recovered rapidly. The Ottoman sultans, whose court was called the Sublime Porte, embellished Constantinople with many beautiful mosques, palaces, monuments, fountains, baths, aqueducts, and other public buildings. After World War I the city was occupied (1918–23) by the Allies. In 1922 the last Ottoman sultan was deposed and Ankara became (1923) the new capital of Turkey.

Constantinople, First Council of, 381, second ecumenical council. It was convened by Theodosius I, then emperor of the East and a recent convert, to confirm the victory over Arianism. The council drew up a dogmatic statement on the Trinity and defined

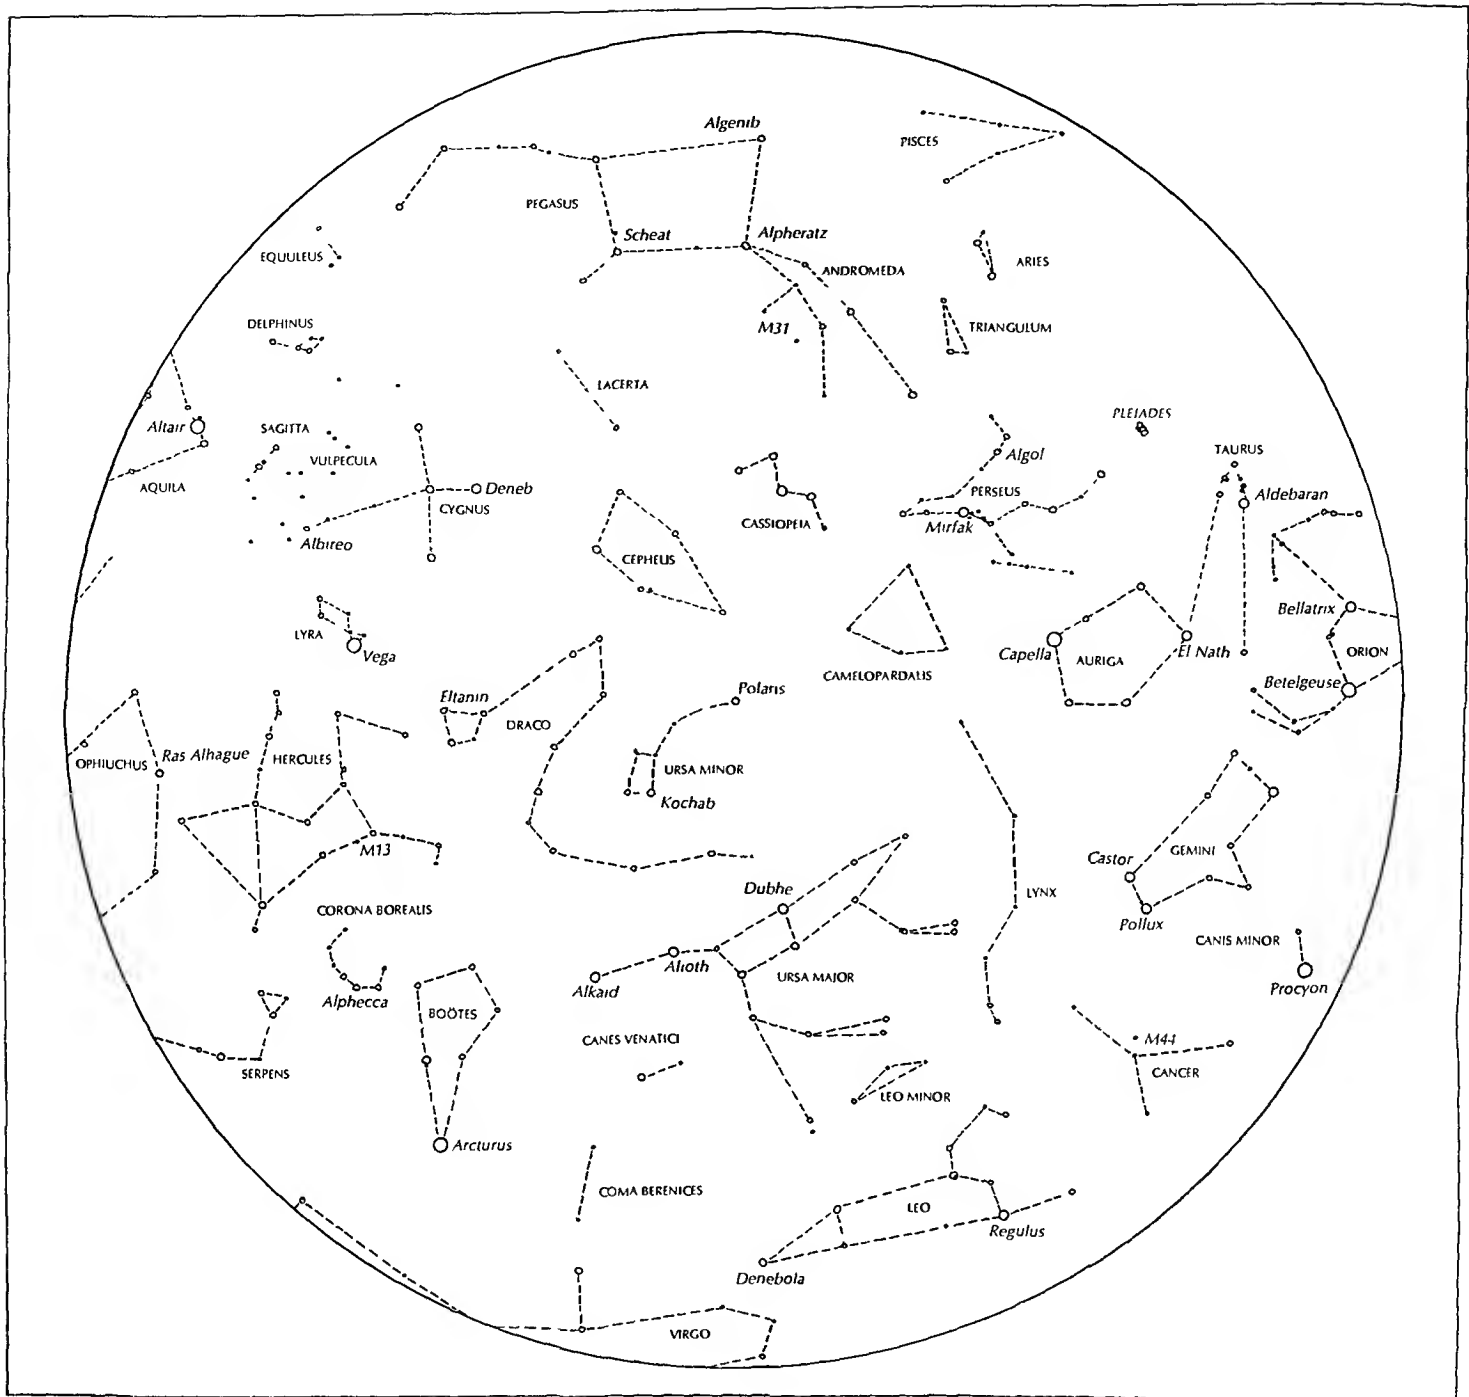

Holy Spirit as having the same divinity expressed for the Son by the Council of Nicaea 56 years earlier. That statement has been lost, but the work of the council established the orthodox teaching of the Trinity as it is held today. The traditional belief ascribing the present form of the Nicene Creed (see CREED) to this council has been questioned by modern scholars. The council condemned all varieties of Arianism along with the new heresy, Apollinarianism. The sessions, which were attended only by bishops of the East, lasted two months. Gregory Nazianzen was reinstated as bishop of Constantinople and then made president of the council when its first president, Meletius of Antioch, died. Gregory resigned when the council disregarded his wishes and elected Flavian of Antioch as Meletius' successor at Antioch. One canon of the council, making the bishop of Constantinople second only to the pope in precedence, was not admitted in the West until the Fourth Lateran Council (1215).

Constantinople, Second Council of, 553, regarded generally as the fifth ecumenical council. It was convened by Byzantine Emperor Justinian I to settle the dispute known as the Three Chapters. In an attempt to reconcile moderate Monophysite parties to orthodoxy, Justinian had issued (544) a declaration of faith. The last three chapters anathematized the writings of THEODORE OF MOPSUESTIA, THEODORET of Cyrus, and Ibas for NESTORIANISM. While the charge was true of their writings to a certain extent, the Council of Chalcedon had cleared those men of any personal heresy. Justinian's edict had the effect of slighting the council and encouraging MONOPHYSITISM; it was deeply resented in the West. Pope VIGILIUS, resisting at first, was constrained to support the edict. Under pressure from the Western bishops he then reversed himself. In retaliation, Justinian called a council at Constantinople, it was attended by only six Western bishops, boycotted by Vigilius, and dominated by Justinian and the Eastern bishops. The council approved the imperial edict and seems to have censured Vigilius. The pope was forced to ratify the council's work the following year. The West, in general, was slow in recognizing it as an ecumenical council, though ultimately it was accepted, chiefly because of the orthodoxy of its pronouncements.

Constantinople, Third Council of, 680, regarded by Roman Catholic and Orthodox Eastern churches as the sixth ecumenical council. It was convoked by Byzantine Emperor Constantine IV to deal with MONOTHELETISM. The council was attended by more than 150 bishops from all over the world, and it was presided over by the papal legates. It condemned Monothelism very clearly by defining the orthodox faith as the acceptance of a separate will and operation in each of the natures of Christ. It also condemned several churchmen as Monothelites, among them an earlier pope, HONORIUS I. The condemnation of Honorius is a much-discussed point in church history. The Orthodox Church accepts as an ecumenical part of the Third Council of Constantinople the Oriental Council of 692, summoned by Justinian II, son and successor of Constantine. It is called in the West the Trullan Synod because it met in the Trullo, i.e., in the dome of the palace, or the Quinisext Synod [Lat., = fifth-sixth] because it is considered in the East to supplement the fifth and sixth ecumenical councils. The Trullan Synod was entirely legislative, and its principal work was the pronouncement of the obligation to observe the canons of the Apostolic CONSTITUTIONS. There was apparently in the legislation an anti-Western tone, and certain practices of the West were condemned.

Constantinople, Fourth Council of, 869–70, regarded as the eighth ecumenical council by the modern Roman Catholic Church. It has never been accepted by the Orthodox Church, which instead recognizes the council of 880 that supported PHOTIUS. The council of 869 was convoked at the suggestion of Basil I, the new Byzantine emperor, to confirm the restoration of St. IGNAZIUS OF CONSTANTINOPLE to the see that Photius had resigned. Only 12 bishops attended at first, and attendance never exceeded 103. The legates of Pope Adrian II presided. Photius had already been condemned, without a hearing, at a Roman synod. At Constantinople his defense was cut short, and when he refused to sign his own condemnation, he was excommunicated. The result of these councils was to intensify the bitterness between East and West.

Constantinople, Latin Empire of, 1204–61, feudal empire established in the S Balkan Peninsula and the Greek archipelago by the leaders of the Fourth Crusade (see CRUSADES) after they had sacked (1204)

Constellations Northern sky

Constantinople, also known as the empire of *Romania* (not to be confused with the modern nation Rumania). Its secular and ecclesiastic governments were carefully divided among the Crusaders and their Venetian creditors. It was on both sides of the Dardanelles, its rulers were also suzerains of the kingdom of Thessalonica, the principality of Achaia, and other fiefs. BALDWIN I, HENRY OF FLANDERS, Peter of Courtenay and his wife, Yolande, ROBERT OF COURTENAY, JOHN OF BRIENNE, and BALDWIN II were rulers. The empire declined immediately after its creation, being beset by the Greek emperors of Nicaea (see NICAIA, EMPIRE OF) and despots of Epirus (see EPIRUS, DESPOTATE OF), by the Bulgars under IVAN II (Ivan Asen), by the Turks, by discord among the Westerners, and by Greek resistance. In 1222, Thessalonica fell to the despot of Epirus. By 1224 the Nicaean Emperor JOHN III had recovered Asia Minor. Constantinople, nearly captured by Ivan Asen in 1234, fell to Emperor MICHAEL VIII in 1261. Venice, however, retained possession of most of the Greek isles, the duchy of Athens passed under Catalan rule, and Achaia stayed in the hands of the VILLEHARDOUIN family until 1278. See William Miller, *The Latins in the Levant* (1908, repr. 1964), D. E. Queller, ed., *The Latin Conquest of Constantinople* (1971).

Constantinus Africanus (kōn'stāntī'nās āfrīkā'nās), c. 1010–1087, medical translator and Benedictine monk. The life of Constantinus before his arrival at Salerno c. 1070 is obscure. According to the monk who wrote his biography, Constantinus was born in Carthage, traveled extensively in North Africa and various parts of Asia for four decades, and accumulated everywhere manuscripts on medicine and other sciences. Ejected from Carthage as a magician, he fled to Salerno, where he remained for several years before retiring in 1076 to Monte Cassino. There he spent his remaining years in great activity, among the 30-odd works attributed to him are translations of HIPPOCRATES, GALEN, Isaac Judaeus, and Haly Abbas.

Constantius I (Constantius Chlorus) (kōn'stāntī'shās), c. 250–306, Roman emperor (305–6). A career general, he gave up St. HELENA to marry Theodora, the daughter of MAXIMIAN. He was made caesar (subemperor) under Maximian in 293 and gained prestige when his forces defeated the rebel CARAUSIUS. He went to Britain in 296, where he put down a rebellion of Carausius' successor, Allectus. Returning to Gaul, he defeated the Alemanni in 298. His vigor and his moderation made him popular with the people of the colonies as well as with his soldiers. The two

emperors, Diocletian and Maximian, abdicated in 305, and Constantius and Galerius became emperors. The next year, however, Constantius died at York. On his death the imperial throne was claimed by his son Constantine (CONSTANTINE I), but the office was long contested.

Constantius II, 317–61, Roman emperor, son of Constantine I. When the empire was divided (337) at the death of Constantine, Constantius II was given rule over Asia Minor, Syria, and Egypt, while his brothers, Constans I and Constantine II, received other portions. He gained prestige by fighting successfully against the Persians. When in 350 the murder of Constans I threw the West into disorder, Constantius II defeated the usurping Magnentius, a German who had been a commander under Constans I, and became sole emperor. He delegated much power to his cousin Julian (JULIAN THE APOSTATE) in Gaul. When a new dispute erupted with the Persians, Constantius ordered Julian to the East, but Julian's men revolted and proclaimed (360) Julian emperor in the West. Constantius died in the Persian campaign in Cilicia, naming Julian as his successor. A confirmed Arian, Constantius vigorously repressed paganism and was involved in a struggle with St. Athanasius.

Constellation, U.S. frigate, launched in 1797. She was named by President Washington for the constellation of 15 stars in the U.S. flag of that time. The frigate was built to serve against the pirates of the Barbary States, but after the outbreak (1798) of hostilities between the United States and France, she was stationed in Caribbean waters. After the *Constellation*, commanded by Thomas Truxtun, encountered and captured (Feb., 1799) the vessel *Insurgente*, she won (Feb., 1800) a hard-fought victory

constellation (kɒnstɪlˈəʃən), in common usage, group of stars that are imagined to form a configuration in the sky, properly speaking, a constellation is a definite region of the sky in which the configuration of stars is contained. Identifiable groupings of bright stars have been recognized and named since ancient times, the names corresponding to mythological figures (e.g., Perseus, Andromeda, Hercules, Orion), animals (e.g., Leo the Lion, Cygnus the Swan, Draco the Dragon), or objects (e.g., Libra the Balance, Corona the Crown). Ptolemy listed 48 constellations in his *Almagest* (2d cent. A.D.). As systematic observations were extended to the entire southern sky from the 17th cent. on, more constella-

tions were added to the list by J. Bayer, N. L. de Lacaille, and others. For example, Ptolemy's 48th constellation, Argo Navis, representing a ship, was divided into four smaller constellations corresponding to different parts of the ship. The final list consists of 88 constellations, each associated with a definite region of the sky. Thus, the entire CELESTIAL SPHERE is divided, with the boundaries fixed by international agreement, along lines of right ascension (R.A.) and declination (Dec.). See EQUATORIAL COORDINATE SYSTEM. The 12 constellations located along or near the ECLIPTIC, the apparent path of the sun through the heavens, are known as the constellations of the ZODIAC; the remaining constellations are officially classified as northern (28 constellations) or southern (48 constellations). The accompanying table lists the constellations according to their official Latin names, with the English equivalents and the approximate positions given. In some cases the English name is not an exact translation of the Latin, e.g., the English name for the constellation Pictor reflects the fact that the figure in the constellation is not the painter himself but his easel. Certain familiar star groups are not listed as constellations because they form only part of a larger constellation; the Big Dipper and Little Dipper are parts of the

* Zodiac constellation

constellations Ursa Major and Ursa Minor, and the Northern Cross is part of Cygnus. Bright stars within a constellation are designated according to a system originated by Bayer: the brightest star is designated by the Greek letter *alpha* followed by the genitive form of the Latin name for the constellation, the second brightest star by *beta*, and so on, with Roman letters and pairs of Roman letters being used after the Greek letters have all been assigned. For example, the brightest star in Taurus, Aldebaran, is designated Alpha Tauri, the second brightest, El-nath, is designated Beta Tauri, and so on. Some stars have changed in brightness since Bayer's time, so that the alphabetical order does not necessarily indicate their present relative brightness. In a few cases, e.g., Ursa Major, the assignment of a Bayer name is according to position rather than brightness.

constipation, infrequent or difficult passage of feces. Constipation may be caused by the lack of adequate roughage or fluid in the diet, prolonged physical inactivity, certain drugs, or emotional disturbance. Sudden unexplained changes in bowel habits can be a symptom of a serious disorder (such as lower intestinal obstruction by a growth) and should receive medical attention. Most cases of constipation can be relieved by following a diet that includes adequate roughage and fluid and by establishing regular habits of evacuation. The continued use of laxatives is inadvisable. Daily bowel movements are not essential, many persons suffer from the harm caused by constant use of laxatives and enemas in an effort to establish the desired regularity.

Constitution, U.S. 44-gun frigate, nicknamed *Old Ironsides*. She was perhaps the most famous vessel in the history of the U.S. navy. Authorized by Congress in 1794, she was launched in 1797 and was

commissioned and put to sea in 1798 in the undeclared naval war with the French. She participated in the Tripolitan War. In the War of 1812, serving as flagship for Isaac Hull, she won a battle with the British vessel *Guerrriere* on Aug. 19, 1812, and under the command of William Bainbridge she defeated the *Java* on Dec. 29, 1812. Charles Stewart was commanding the *Constitution* when on Feb. 20, 1815, she overcame the *Cyane* and the *Levant* (though the *Levant* was later recaptured by the British). The *Constitution* was condemned (1830) as unseaworthy, but public sentiment, aroused by Oliver Wendell Holmes's poem "Old Ironsides," saved the ship from dismantling, and she was rebuilt in 1833. She was laid up at the Portsmouth navy yard in 1855 and was there used as a training ship. In 1877 she was rebuilt, and the next year she crossed the Atlantic. In 1897 she was stored at the Boston navy yard, and in 1925, under authorization of Congress, she was rebuilt by public subscription. She is now maintained at the Boston navy yard. See James Barnes, *Naval Actions of the War of 1812* (1896), Ira N. Hollis, *The Frigate Constitution* (1901), Elliot Snow, *On the Deck of "Old Ironsides"* (1932), T. P. Horgan, *Old Ironsides* (1963), J. E. Jennings, *Tattered Ensign* (1966).

constitution, fundamental principles of government in a nation, either implied in its laws, institutions, and customs or embodied in one document or in several. In the first category—customary and unwritten constitutions—is the British constitution, which is contained implicitly in the whole body of common and statutory law of the realm and in the practices and traditions of the workings of the government. Because it can be modified by an ordinary act of PARLIAMENT, the British constitution is often termed flexible. In the 18th, 19th, and 20th centuries many countries, having made sharp political and

economic departures from the past, had little legal custom to rely upon and therefore set forth their organic laws in written constitutions—some of which are judicially enforced. While the written constitutions of several countries could, in theory, be drastically changed overnight by legislative enactment (and thus are also termed flexible), the CONSTITUTION OF THE UNITED STATES is classified as rigid—one that has superior sanction to the ordinary laws of the land and that is subject to a specially prescribed process of AMENDMENT. Its so-called rigidity, however, has been counterbalanced by growth and usage. Statutory elaboration (see CONGRESS OF THE UNITED STATES) and judicial construction (see SUPREME COURT, UNITED STATES, and MARSHALL JOHN) have kept the written document abreast of the times. See Carl J. Friedrich, *Constitutional Government and Democracy* (1950), W. G. Andrews, ed., *Constitutions and Constitutionalism* (1961), John H. Franklin, *Constitutionalism and Resistance in the Sixteenth Century* (1969).

Constitutional Convention. see FEDERAL CONSTITUTIONAL CONVENTION

Constitutional Union party, in U.S. history, formed when the conflict between North and South broke down the older parties. The Constitutional Union group, composed of former Whigs and remnants of the Know-Nothings and other groups in the South, was organized just before the election of 1860. Delegates from 20 states attended the party convention at Baltimore in May, 1860, and John Bell, of Tennessee, and Edward Everett, of Massachusetts, were nominated for President and Vice President. The party recognized "no political principle but the Constitution of the country, the union of the states and the enforcement of laws." The party carried Kentucky, Tennessee, and Virginia in the election.

Constitution Island, in the Hudson River opposite West Point, SE N.Y., part of the U.S. Military Academy. The ruins of Fort Constitution, built in 1775, are there. During the American Revolution, a chain was stretched across the Hudson at Constitution Island to prevent the ascent of British ships.

Constitution of Athens, treatise by Aristotle or a member of his school, written in the late 4th cent. B.C. It was lost until discovered on Egyptian papyrus in 1890. It is a history of the Athenian government and an account of its operation in the time of Aristotle. It is a valuable historical source. See tr. by Harris Rackham (rev. ed. 1961), study by J. H. Day and Mortimer Chambers (1962).

Constitution of the United States, document embodying the fundamental principles upon which the American republic is conducted. Drawn up at the FEDERAL CONSTITUTIONAL CONVENTION in Philadelphia in 1787, the Constitution was signed on Sept. 17, 1787, and ratified by the required number of states (nine) by June 21, 1788. It superseded the original charter of the United States in force since 1781 (see CONFEDERATION, ARTICLES OF) and established the system of Federal government that began to function in 1789. The Constitution is concise, and its very brevity and its general statement of principles have, by accident more than by design, made possible the extension of meaning that has fostered growth. There are seven articles and a Preamble, 26 amendments have been adopted. The Preamble does not confer power, but its first words, "We the People of the United States," describe the source of the powers conferred by the rest of the Constitution and have been used by the advocates of a strong union arguing against the proponents of STATES' RIGHTS. The Preamble also states the purpose of the document. One of the statements of purpose, "to promote the general welfare," has been of great importance in the 20th cent. in upholding social legislation, for which no warrant could be found in the enumerated powers of Congress. The first three articles set up the three-fold separation of powers, said to have been modeled on Montesquieu's study of the British government. In actuality this separation has been weakened by the granting of greater powers to the President and his administrative agencies, which now have legislative and judicial as well as executive functions. Article 1 provides for the establishment of the bicameral Congress composed of the Senate and the House of Representatives. The various powers of the Congress and the respective houses, together with their methods of election, are enumerated in the article. The Seventeenth Amendment, passed in 1916, instituted the direct popular election of Senators and removed the power of their election from the state legislatures as had originally been provided in Article 1. Section 4 of Article 1

TEXT* OF THE

CONSTITUTION OF THE UNITED STATES

PREAMBLE

We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I

SECTION I

All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives

SECTION II

[1] The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislature

[2] No person shall be a Representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen

[3] Representatives and direct taxes shall be apportioned among the several States which may be included within this Union, according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative, and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose three, Massachusetts, eight, Rhode Island and Providence Plantations, one, Connecticut, five, New York, six, New Jersey, four, Pennsylvania, eight, Delaware, one, Maryland, six, Virginia, ten, North Carolina, five, South Carolina, five, and Georgia, three

[4] When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies

[5] The House of Representatives shall choose their Speaker and other officers, and shall have the sole power of impeachment

SECTION III

[1] The Senate of the United States shall be composed of two Senators from each State, chosen by the legislature thereof for six years, and each Senator shall have one vote

[2] Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year, and if vacancies happen by resignation or otherwise during the recess of the legislature of any State, the executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies

[3] No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen

[4] The Vice-President of the United States shall be President of the Senate, but shall have no vote unless they be equally divided

[5] The Senate shall choose their other officers and also a President pro tempore in the absence of the Vice-President, or when he shall exercise the office of President of the United States

[6] The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside, and no person shall be convicted without the concurrence of two-thirds of the members present

[7] Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States, but the party convicted shall, nevertheless, be liable and subject to indictment, trial, judgment, and punishment, according to law

SECTION IV

[1] The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the legislature thereof, but the Congress may at any time by law make or alter such regulations, except as to the places of choosing Senators

[2] The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall by law appoint a different day

SECTION V

[1] Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business, but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner, and under such penalties, as each House may provide

[2] Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and with the concurrence of two-thirds, expel a member

[3] Each House shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy, and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal

[4] Neither House, during the session of Congress, shall, without the consent of the other adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting

SECTION VI

[1] The Senators and Representatives shall receive a compensation for their services, to be ascertained by law and paid out of the Treasury of the United States. They shall, in all cases except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same, and for any speech or debate in either House they shall not be questioned in any other place

[2] No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time, and no person holding any office under the United States shall be a member of either House during his continuance in office

SECTION VII

[1] All bills for raising revenue shall originate in the House of Representatives, but the Senate may propose or concur with amendments as on other bills

[2] Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the President of the United States, if he approve he shall sign it, but if not he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House, by which it shall likewise be reconsidered, and if approved by two-thirds of that House it shall become a law. But in all such cases the vote of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law, in like manner as if he had signed it, unless the Congress by their adjournment prevent its return, in which case it shall not be a law

[3] Every order, resolution or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States, and before the same shall take effect shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill

SECTION VIII

[1] The Congress shall have power to lay and collect taxes, duties, imposts and excises, to pay the debts and provide for the common defense and general welfare of the United States, but all duties, imposts and excises shall be uniform throughout the United States,

[2] To borrow money on the credit of the United States,

[3] To regulate commerce with foreign nations, and among the several States, and with the Indian tribes,

[4] To establish a uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States,

[5] To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures

* Modern usage in spelling, punctuation and capitalization has been employed

[6] To provide for the punishment of counterfeiting the securities and current coin of the United States,

[7] To establish post offices and post roads,

[8] To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries,

[9] To constitute tribunals inferior to the Supreme Court,

[10] To define and punish piracies and felonies committed on the high seas and offenses against the law of nations,

[11] To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water,

[12] To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years,

[13] To provide and maintain a navy,

[14] To make rules for the government and regulation of the land and naval forces,

[15] To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions,

[16] To provide for organizing, arming and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress,

[17] To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of the Government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings,

[18] To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof

SECTION IX

[1] The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person

[2] The privilege of the writ of habeas corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it

[3] No bill of attainder or ex post facto law shall be passed

[4] No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken

[5] No tax or duty shall be laid on articles exported from any State

[6] No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another, nor shall vessels bound to or from one State be obliged to enter, clear or pay duties in another

[7] No money shall be drawn from the Treasury but in consequence of appropriations made by law, and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time

[8] No title of nobility shall be granted by the United States, and no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title of any kind whatever from any king, prince, or foreign state

SECTION X

[1] No State shall enter into any treaty, alliance, or confederation, grant letters of marque and reprisal, coin money, emit bills of credit, make anything but gold and silver coin a tender in payment of debts, pass any bill of attainder, ex post facto law or law impairing the obligation of contracts, or grant any title of nobility

[2] No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws, and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the Treasury of the United States, and all such laws shall be subject to the revision and control of the Congress

[3] No State shall, without the consent of Congress, lay any duty of tonnage, keep troops and ships of war in time of peace, enter into any agreement or compact with another State or with a foreign power, or engage in war, unless actually invaded or in such imminent danger as will not admit of delay

ARTICLE II

SECTION I

[1] The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and together with the Vice-President, chosen for the same term, be elected as follows

[2] Each State shall appoint, in such manner as the legislature thereof may direct, a number of Electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress, but no Senator or Representative, or person holding an office of trust or profit under the United States, shall be appointed an Elector

[3] The Electors shall meet in their respective States and vote by ballot for two persons, of whom one at least shall not be an inhabitant of the same State with themselves. And they shall make a list of all the persons voted for, and of the number of votes for each, which list they shall sign and certify, and transmit sealed to the seat of government of the United States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes shall be the President, if such number be a majority of the whole number of Electors appointed, and if there be more than one who have such majority, and have an equal number of

votes, then the House of Representatives shall immediately choose by ballot one of them for President, and if no person have a majority, then from the five highest on the list the said House shall in like manner choose the President. But in choosing the President the votes shall be taken by States, the representation from each State having one vote, a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. In every case, after the choice of the President, the person having the greatest number of votes of the Electors shall be the Vice-President. But if there should remain two or more who have equal votes, the Senate shall choose from them by ballot the Vice-President

[4] The Congress may determine the time of choosing the Electors and the day on which they shall give their votes, which day shall be the same throughout the United States

[5] No person except a natural-born citizen, or citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President, neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years a resident within the United States

[6] In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President, and such officer shall act accordingly until the disability be removed or a President shall be elected

[7] The President shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States or any of them

[8] Before he enter on the execution of his office he shall take the following oath or affirmation

"I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will to the best of my ability preserve, protect, and defend the Constitution of the United States"

SECTION II

[1] The President shall be Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States, he may require the opinion, in writing, of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment

[2] He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur, and he shall nominate, and, by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States whose appointments are not herein otherwise provided for, and which shall be established by law, but the Congress may by law vest the appointment of such inferior officers, as they think proper, in the President alone, in the courts of law, or in the heads of departments

[3] The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session

SECTION III

He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient, he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper, he shall receive ambassadors and other public ministers, he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States

SECTION IV

The President, Vice-President and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery, or other high crimes and misdemeanors

ARTICLE III

SECTION I

The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the Supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation which shall not be diminished during their continuance in office

SECTION II

[1] The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority, to all cases affecting ambassadors, other public ministers, and consuls, to all cases of admiralty and maritime jurisdiction, to controversies to which the United States shall be a party, to controversies between two or more States, between a State and citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign states, citizens, or subjects

[2] In all cases affecting ambassadors, other public ministers and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned the Supreme Court shall have

appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make

[3] The trial of all crimes, except in cases of impeachment, shall be by jury, and such trial shall be held in the State where the said crimes shall have been committed, but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed

SECTION III

[1] Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court

[2] The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attained

ARTICLE IV

SECTION I

Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof

SECTION II

[1] The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States

[2] A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime

[3] No person held to service or labor in one State, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim to the party to whom such service or labor may be due

SECTION III

[1] New States may be admitted by the Congress into this Union, but no new State shall be formed or erected within the jurisdiction of any other State, nor any State be formed by the junction of two or more States or parts of States, without the consent of the legislatures of the States concerned as well as of the Congress

[2] The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States, and nothing in this Constitution shall be so construed as to prejudice any claims of the United States or of any particular State

SECTION IV

The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and on application of the legislature, or of the executive (when the legislature cannot be convened), against domestic violence

ARTICLE V

The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which in either case shall be valid to all intents and purposes as part of this Constitution, when ratified by the legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress, provided that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the Ninth Section of the First Article, and that no State, without its consent shall be deprived of its equal suffrage in the Senate

ARTICLE VI

[1] All debts contracted and engagements entered into, before the adoption of this Constitution, shall be as valid against the United States under this Constitution as under the Confederation

[2] This Constitution, and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land, and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding

[3] The Senators and Representatives before mentioned and the members of the several State legislatures, and all executive and judicial officers both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution, but no religious test shall ever be required as a qualification to any office or public trust under the United States

ARTICLE VII

The ratification of the conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same

AMENDMENT I

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof, or abridging the freedom of speech or of the press, or the right of the people peaceably to assemble, and to petition the government for a redress of grievances

AMENDMENT II

A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed

AMENDMENT III

No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law

AMENDMENT IV

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized

AMENDMENT V

No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger, nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty or property, without due process of law, nor shall private property be taken for public use without just compensation

AMENDMENT VI

In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation, to be confronted with the witnesses against him, to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense

AMENDMENT VII

In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States, than according to the rules of the common law

AMENDMENT VIII

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted

AMENDMENT IX

The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people

AMENDMENT X

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people

AMENDMENT XI

The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state

AMENDMENT XII

[1] The Electors shall meet in their respective States and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same State with themselves, they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted The person having the greatest

number of votes for President shall be the President, if such number be a majority of the whole number of Electors appointed, and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President the votes shall be taken by States, the representation from each State having one vote, a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President.

[2] The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President, a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

AMENDMENT XIII

SECTION I

Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

SECTION II

Congress shall have power to enforce this article by appropriate legislation.

AMENDMENT XIV

SECTION I

All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty or property, without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

SECTION II

Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of Electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

SECTION III

No person shall be a Senator or Representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

SECTION IV

The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave, but all such debts, obligations, and claims shall be held illegal and void.

SECTION V

The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

AMENDMENT XV

SECTION I

The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

SECTION II

The Congress shall have power to enforce this article by appropriate legislation.

AMENDMENT XVI

The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration.

AMENDMENT XVII

SECTION I

The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years, and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislatures.

SECTION II

When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies. Provided, that the legislature of any State may empower the executive thereof to make temporary appointments until the people fill the vacancies by election as the legislature may direct.

SECTION III

This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

AMENDMENT XVIII

SECTION I

After one year from the ratification of this article the manufacture, sale or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof, for beverage purposes, is hereby prohibited.

SECTION II

The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

SECTION III

This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

AMENDMENT XIX

SECTION I

The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

SECTION II

Congress shall have power to enforce this article by appropriate legislation.

AMENDMENT XX

SECTION I

The terms of the President and Vice-President shall end at noon on the 20th day of January, and the terms of Senators and Representatives at noon on the 3d day of January, of the years in which such terms would have ended if this article had not been ratified, and the terms of their successors shall then begin.

SECTION II

The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3d day of January, unless they shall by law appoint a different day.

SECTION III

If, at the time fixed for the beginning of the term of the President, the President-elect shall have died, the Vice-President-elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term or if the President-elect shall have failed to qualify, then the Vice-President-elect shall act as President until a President shall have qualified, and the Congress may by law provide for the case wherein neither a President-elect nor a Vice-President-elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-President shall have qualified.

SECTION IV

The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

SECTION V

Sections I and II shall take effect on the 15th day of October following the ratification of this article

SECTION VI

This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission

AMENDMENT XXI

SECTION I

The eighteenth article of amendment to the Constitution of the United States is hereby repealed

SECTION II

The transportation or importation into any State, territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited

SECTION III

This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress

AMENDMENT XXII

SECTION I

No person shall be elected to the office of President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of President more than once. But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative from holding the office of President or acting as President during the remainder of such term

SECTION II

This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission to the States by the Congress

AMENDMENT XXIII

SECTION I

The District constituting the seat of Government of the United States shall appoint in such manner as the Congress may direct

A number of electors of President and Vice-President equal to the whole number of Senators and Representatives in Congress to which the District would be entitled if it were a State, but in no event more than the least populous State, they shall be in addition to those appointed by the States, but they shall be considered, for the purposes of the election of President and Vice-President, to be electors appointed by a State, and they shall meet in the District and perform such duties as provided by the twelfth article of amendment

SECTION II

The Congress shall have power to enforce this article by appropriate legislation

gives the states power over the conduct of Federal elections but permits the Congress to alter such regulations at any time. In 1842 the Congress imposed the district system on the United States. In 1962 the Supreme Court dealt with proper apportionment of election districts and in its decision in *Baker vs. Carr* allowed voters to go into a Federal court to force equitable representation in a state legislature. This decision was, however, based on the equal protection clause of the Fourteenth Amendment. Later, the court ruled (1964) that state legislative apportionment must reflect the one-man one-vote principle. As a legislative body Congress has certain inherent powers. Among these are the power to investigate pursuant to legislative needs. Congressional investigations have led to a great many court decisions concerning the right of a witness before a Congressional committee to refuse to testify even when granted immunity from prosecution. Section 8 of Article 1 lists the enumerated powers of the Congress. The clause of this section, the "commerce clause," which grants the Congress the right to "regulate commerce with foreign nations, and among the several States," has, in the 20th century, been used as a strong argument for the expansion of government power. Since the historic case

of *GIBBONS vs. OGDEN*, the commerce clause has been the battleground over which much of the struggle for and against increased Federal regulation of private enterprise has been fought. Until the late 1930s Congress exercised its powers under the clause solely with reference to transportation. But after a series of dramatic reversals by the Supreme Court, Congress began to enter areas that had previously been controlled only by the states. The commerce clause is now the source of important peacetime powers of the national government and an important basis for the judicial review of state actions. Besides its enumerated and inherent powers, the Congress has implied powers under Article 1 "to make all laws which shall be necessary and proper for carrying into execution" the enumerated or expressed powers. Sections 9 and 10 of Article 1 contain guarantees of the writ of HABEAS CORPUS, prohibit bills of attainder and ex post facto laws, and also improve certain limitations on state power. Article 2 creates the executive branch of government headed by the President, elected, along with the Vice President, for a term of four years (see PRESIDENT, ELECTORAL COLLEGE). The Twenty-second Amendment (1951) provides that no person may be elected President more than twice. The Twenty-third Amendment (1961) permits District of Colum-

bia residents to vote in presidential elections. Since the adoption of the Constitution there have been two conflicting views of Article 2. The first is that the powers of the President are limited to those enumerated in the article. The opposite view is that the President is given executive power not limited by the provisions of the rest of the article. Every President has had to make the choice of interpretations for himself. Article 3 provides for a judiciary and defines TREASON. Besides its enumerated powers, the judiciary has the inherent authority to interpret laws and the Constitution with an authority that must be deferred to. Article 3 also guarantees trial by jury in criminal cases and lays the basis for Federal jurisdiction. The Eleventh Amendment (1798), which prohibits suits against any state by citizens of another state or foreigners (see SOVEREIGNTY), was passed in reaction to the Supreme Court's accepting jurisdiction of a suit against a state by a citizen of another state. Article 4, dealing with the relations of the states (see CONFLICT OF LAWS), provides that "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State." Section 2 prohibits any state from discriminating against citizens of other states in favor of its own and provides for the extradition of criminals. The article guarantees a republican form

AMENDMENT XXIV

SECTION I

The right of citizens of the United States to vote in any primary or other election for President or Vice-President, for electors for President or Vice-President, or for Senator or Representative in Congress, shall not be denied or abridged by the United States or any State by reason of failure to pay any poll tax or other tax

SECTION II

The Congress shall have power to enforce this article by appropriate legislation

AMENDMENT XXV

SECTION I

In case of the removal of the President from office or of his death or resignation, the Vice-President shall become President

SECTION II

Whenever there is a vacancy in the office of the Vice-President, the President shall nominate a Vice-President who shall take office upon confirmation by a majority vote of both Houses of Congress

SECTION III

Whenever the President transmits to the President pro tempore of the Senate and the Speaker of the House of Representatives his written declaration that he is unable to discharge the powers and duties of his office, and until he transmits to them a written declaration to the contrary, such powers and duties shall be discharged by the Vice-President as Acting President

SECTION IV

Whenever the Vice-President and a majority of either the principal officers of the executive departments or of such other body as Congress may by law provide, transmit to the President pro tempore of the Senate and the Speaker of the House of Representatives their written declaration that the President is unable to discharge the powers and duties of his office, the Vice-President shall immediately assume the powers and duties of the office as Acting President

Thereafter, when the President transmits to the President pro tempore of the Senate and the Speaker of the House of Representatives his written declaration that no inability exists, he shall resume the powers and duties of his office unless the Vice-President and a majority of either the principal officers of the executive department or of such other body as Congress may by law provide, transmit within four days to the President pro tempore of the Senate and the Speaker of the House of Representatives their written declaration that the President is unable to discharge the powers and duties of his office. Thereupon Congress shall decide the issue, assembling within forty-eight hours for that purpose if not in session. If the Congress, within twenty-one days after receipt of the latter written declaration, or, if Congress is not in session, within twenty-one days after Congress is required to assemble, determines by two-thirds vote of both Houses that the President is unable to discharge the powers and duties of his office, the Vice-President shall continue to discharge the same as Acting President, otherwise the President shall resume the powers and duties of his office

AMENDMENT XXVI

SECTION I

The right of citizens of the United States who are eighteen years of age or older, to vote shall not be denied or abridged by the United States or by any State on account of age

SECTION II

The Congress shall have power to enforce this article by appropriate legislation

of government to every state and provides for the admission of new states as well as the government of territories. Article 5 provides for amending the Constitution (see AMENDMENT). Article 6 establishes the supremacy of the Federal Constitution and laws in case of conflict with those of the states. This clause is the heart of the Federal system. Article 6 also provides for an oath of office for members of the three branches of the Federal government and the states and specifically forbids any religious qualification for office. Article 7 declares that the Constitution should go into force when ratified by nine states. The Constitution has undergone gradual alteration with the growth of the country. Some of the 26 amendments were brought on by Supreme Court decisions. The first 9 amendments, which constitute the Bill of Rights, were added, however, within two years of the signing of the Federal Constitution in order to ensure sufficient guarantees of individual liberties. The Bill of Rights applied only to the Federal government. But since the passage of the FOURTEENTH AMENDMENT (1868), many of the guarantees contained in the Bill of Rights have been extended to the states through the "due process" clause of the Fourteenth Amendment. The First Amendment guarantees the freedom of worship, of speech, of the press, of assembly, and of petition to the government for redress of grievances. This amendment has been the center of controversy in recent years in the areas of free speech and religion. The Supreme Court has held that freedom of speech does not include the right to refuse to testify before a Congressional investigating committee and that any organized prayer in the public schools violates the First Amendment. The Second Amendment guarantees the right to bear arms openly—adopted with reference to state militias. Freedom from the quartering of soldiers without the consent of the owner of the house is guaranteed by the Third Amendment. The Fourth Amendment guarantees against unreasonable search and seizure. This safeguard has only recently been extended to the states. The Fifth Amendment provides that no person shall be held for "a capital or otherwise infamous crime" without indictment, be twice put in "jeopardy of life or limb" for the same offense, be compelled to testify against himself, or "be deprived of life, liberty or property, without due process of law." The privilege against self-incrimination has been the center of a great deal of controversy as a result of the growth of Congressional investigations. The phrase "due process of law," which appears in the Fifth Amendment, is also included in the Fourteenth Amendment. As a result there has been much debate as to whether both amendments guarantee the same rights. Those in favor of what is termed fixed due process claim that all the safeguards applied against the Federal government should be also applied against the states through the Fourteenth Amendment. The supporters of the concept of flexible due process are willing only to impose those guarantees on the states that "are implicit in the concept of ordered liberty." The Sixth Amendment guarantees the right of a speedy and public trial by an impartial jury in all criminal proceedings, while the Seventh Amendment guarantees the right of trial by jury in all common-law suits "where the value in controversy shall exceed twenty dollars," and the Eighth Amendment prohibits excessive bail and fines and "cruel and unusual" punishment. The Ninth Amendment states that "The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people." By the Tenth Amendment, generally considered with the first nine (they all went into effect in 1791), "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." Powers reserved to the states are often termed "residual powers." This amendment, like the commerce clause, has been a battleground in the struggle against states' rights and for Federal supremacy. The Eleventh Amendment has already been discussed under Article 3. The Twelfth (1804) revised the method of electing President and Vice President. The Thirteenth (1865), Fourteenth (1868), and Fifteenth (1870) amendments, arising out of the Civil War and Reconstruction, abolish slavery and guarantee civil rights and the suffrage to U.S. citizens, including former slaves. The Sixteenth Amendment (1913) authorizes the INCOME TAX. The Seventeenth has been described under Article 1. The Eighteenth (1919)—repealed by the Twenty-first (1933)—introduced PROHIBITION. The Nineteenth (1920) grants WOMAN SUFFRAGE. The Twentieth (1933) abolishes the so-called lame-duck Congress and al-

ters the date of the presidential inauguration. The Twenty-second and the Twenty-third amendments have been discussed under Article 2. The Twenty-fourth Amendment (1964) outlaws the poll tax and any other tax as a requirement for voting in primaries and elections for Federal office. The Twenty-fifth (1967) establishes the procedure for filling the office of Vice President between elections and for governing in the event of presidential disability. The Twenty-sixth (1971) lowers the voting age in all elections to 18. In 1972 an amendment prohibiting all legal forms of discrimination based on sex was submitted to the states for ratification. The wording of the Constitution is general, necessitating interpretation, and any short summary is only rough and approximate. From its very beginnings, the Constitution has been subject to violent controversies, not only in interpretation of some of its phrases, but also between the "loose constructionists" and "strict constructionists." The middle of the 19th cent. saw a tremendous struggle concerning the nature of the Union and the extent of states' rights. The Civil War decided the case in favor of the advocates of strong union, and since that time the general tendency has been toward the centralization and strengthening of Federal power. See C. A. Beard, *An Economic Interpretation of the Constitution* (1913, repr. 1965), C. H. McIlwain, *Constitutionalism, Ancient and Modern* (rev. ed. 1947, repr. 1958), Edward Dumbauld, *The Bill of Rights and What It Means Today* (1957) and *The Constitution of the United States* (1964), A. H. Kelly and W. A. Harbison, *The American Constitution* (4th ed. 1970), E. S. Corwin, *The Constitution and What It Means Today* (13th rev. ed. 1973), Rexford Tugwell, *The Emerging Constitution* (1974).

Constitutions, Apostolic, late 4th-century compilation, in eight books, of administrative canons for the clergy and the laity and of guides for worship. They were supposed to be works of the apostles, but actually included the greater part of the *Didascalia Apostolorum*, a lost Greek treatise of 3d-century origin, most of the DIDACHE, and fragments from Hippolytus and Papias. The work concludes with a collection of 85 moral and liturgical canons known as the "Apostolic Canons," a portion of which became part of canon law of the Western Church. The work is thought to be of Syrian origin. The whole is a valuable primary source on early church history and practice.

Constructivism, Russian art movement founded c. 1913 by Vladimir Tatlin (1885-1956), related to the movement known as SUPREMATISM. After 1916 the brothers Naum (Pevsner) Gabo and Antoine Pevsner gave new impetus to Tatlin's art of purely abstract constructions. Their sculptural works derived from cubism and futurism, but had a more architectonic emphasis, related to the technology of the society in which they were created. The Soviet regime at first encouraged this new style. However, beginning in 1921, constructivism (and all modern art movements) were officially disparaged as unsuitable for mass propaganda purposes. Gabo and Pevsner went into exile, while Tatlin remained in Russia. In theatrical scene design constructivism spread beyond Russia through the efforts of Vsevolod MEYERHOLD. See George Rickey, *Constructivism* (1967).

consubstantiation see LORD'S SUPPER

consul, title of the two chief magistrates of ancient Rome. The institution is supposed to have arisen with the expulsion of the kings, traditionally in 510 B.C., and it was well established by the early 4th cent. B.C. The consuls led the troops, controlled the treasury, and were supreme in the government. At first only patricians were eligible, but in 367 B.C. the Licinian law opened the office to plebeians. Before becoming consul a man generally had to have experience as quaestor, aedile, and praetor, and the minimum age for a consul was normally set at 40 or 45. Ex-consuls became provincial governors as pro-consuls. The year was identified by the names of the two consuls in office during that time. Under the empire the title of consul was continued, but only as a title of honor, sometimes conferred on infants or small boys.

consular service, organized body of public officers maintained by a government in the important ports and trade centers of foreign countries to protect the persons and interests of its nationals and to aid them in every possible way. Consuls are officially recognized by a foreign state through the issuance of an authorization known as an exequatur, which may be revoked by the admitting state at any time. The many duties of U.S. consuls in foreign states

include promoting and protecting American commercial interests, issuing passports and verifying citizenship, certifying the sanitary conditions of the cargo, crew, and passengers of vessels leaving for U.S. ports, and mediating with local officials in cases of legal matters involving American citizens. The consular service was once strictly distinguished from the DIPLOMATIC SERVICE, but because of the interrelated duties of the two branches, the Rogers Act of 1924 consolidated both into the Foreign Service of the Department of State. The Department of Commerce and the Department of the Treasury may place commercial attaches at a consulate office to aid in gathering statistics and promoting trade. The persons of consuls enjoy immunity and EXTRATERRITORIALITY in all matters pertaining to their official functions, and the premises of consulates are likewise privileged. Such privileges are granted either by courtesy or through special consular treaties.

Consulate, 1799-1804, in French history, form of government established after the coup d'état of 18 Brumaire (Nov. 9-10, 1799), which ended the DIRECTORY. Three consuls were appointed to rule France—Napoleon Bonaparte (see NAPOLEON I), Emmanuel Joseph SIEYÈS, and Roger Ducos. Sieyès and Ducos were soon replaced by Jean Jacques Régis de CARNOT and C. F. LEBRUN, and the Consulate became little more than a scheme for autocratic government by Bonaparte, who was made first consul for life in 1802 and emperor in 1804.

Consumer Affairs, Office of, agency of the U.S. Department of Health, Education, and Welfare, established 1971. The office advises and represents the President on matters of consumer interest and analyzes and coordinates activities of the Federal government in the area of consumer protection. It conducts investigations and surveys on matters of consumer interest, takes action on individual consumer complaints, makes available to the public information the government has acquired in making its own purchases, and presses for legislation to protect the consumer.

Consumers' League, National, organization designed to promote better conditions among workers by encouraging the purchase of articles made and sold under good working conditions. The movement started in England (1890), the U.S. group was founded (1899) by Florence Kelley and her followers. The league undertook to investigate factories and to educate consumers in purchasing habits. For many years the league used a label for goods which had passed inspection, and many consumers learned to purchase only those goods thus labeled. Many of the objectives of the league are now a matter of law, e.g., shorter hours, a minimum wage, payment for overtime, and the abolition in most states of child labor. It has a membership of about 15,000. See Maud Nathan, *Story of an Epoch-making Movement* (1926).

Consumers' Union, product testing and rating organization founded (1936) to provide consumers with information and counsel regarding major retail goods and services. Through its monthly *Consumer Reports* (circulation c. 2 million), the union reports on a diverse range of products, from major appliances and automobiles to health-care and family-planning aids. The organization, whose headquarters is in Mount Vernon, N.Y., also represents consumer interests at government hearings.

consumption, in economics, utilization of goods and services. Consumption may be considered either productive or unproductive. Productive consumption involves wealth used in the process of producing other wealth (e.g., the use of materials and capital to produce other goods), and unproductive consumption involves using wealth for the direct satisfaction of human wants. In a second sense, consumption is viewed as a basically subjective phenomenon, with individual utility, or satisfaction, assuming primary importance. The foremost economist associated with the subjective view was Jeremy Bentham (1748-1832), whose English followers long sought to measure quantitatively the utility provided by consumption. The process of consumption is central to any system of economics. Adam Smith made it the sole end of production. Production, the wholesale and retail trades, and consumption are closely linked, and the exchange of goods and services for money along the various stages from the producer to the ultimate consumer is the foundation of modern capitalist economy. Advertising is today the chief means by which manufacturers and retailers seek to increase consumption, leading many to contend that modern consumption is often governed by false needs. Since the introduction of

the theories of John Maynard KEYNES, contemporary economics has increasingly concerned itself with studying total consumption, in the hope that a better understanding of its relationship to national income would lead to effective governmental control of the business cycle. Experience has shown that through taxation the modern government is often able to regulate the amount of its citizenry's disposable income, thus ultimately affecting the nation's total consumption. See E. W. Gilboy, *Primer on the Economics of Consumption* (1968); Thomas Mayer, *Permanent Income, Wealth, and Consumption* (1973).

contact lens, thin plastic lens worn between the eye and eyelid that may be used instead of eyeglasses. Actors, models, and others wear them for appearance, and athletes use them for safety and convenience. Contact lenses may also be used to correct certain abnormalities of the eye that cannot be corrected by regular glasses. A. E. Fick, a Swiss physician, made the first contact lens in 1887. The heavy glass lenses exerted an uncomfortable pressure on the eyeball, covered the entire eye surface, and were difficult to fit. In 1938 the first plastic contact lens was made by Theodore E. Obrig from a newly discovered methylmethacrylate plastic, known as Plexiglas or Lucite, that could be molded into shape. He also devised a quick way to fit the lens that did not involve months of trial and error. The major drawback was that a solution placed between the lens and eye had to be changed every few hours because the wearer's tears could not circulate beneath the lens. In 1950 the corneal contact lens was introduced. It covered only the cornea of the eye, floated on the tears of the wearer, and could be worn all day without difficulty. Recent improvements include a flexible lens that shortens the initial period of adjustment for the wearer and a porous lens that does not have to be removed each day.

Contarini (kōntā-rē-nē), ancient Venetian family, including eight doges, a cardinal, and several artists. The most celebrated member was Andrea Contarini, 1300?-1382. He was doge (1368-82) at the time of the War of CHIOGGIA between Venice and Genoa, he proved his patriotism by melting his gold and silver plate and mortgaging his lands to raise money for the state.

contempt, in law, interference with the functioning of a legislature or court. In its narrow and more usual sense, contempt refers to the despising of the authority, justice, or dignity of a court. A contempt of court can be classified as civil or criminal, direct or constructive. Civil and criminal contempts are distinguished by the function of the punishment—if it is to vindicate judicial authority, the contempt is criminal, if it is to enforce the rights and remedies of a party, the contempt is civil. A direct contempt is one committed in the presence of the court while it is in session. A constructive contempt is one that is committed at a distance from the court and that tends to obstruct or defeat the administration of justice. A refusal to answer a question when directed to answer by a judge is a direct criminal contempt. Disobeying an INJUNCTION or a court order that a judgment (e.g., ALIMONY) be satisfied is a civil contempt. A major distinction is whether the court needs to hear evidence to determine if a contempt was committed. Direct criminal contempts may be punished summarily by fine or imprisonment, civil and constructive criminal contempts can also be punished by fine or imprisonment, but the accused must be granted a hearing. A contempt arising over comment on a court case involves an apparent danger to freedom of expression, and some jurisdictions require indictment and trial by jury. In the United States, Congress can punish for contempt of Congress behavior that occurred during legislative proceedings and that threatened legislative power. Congress must act before it adjourns, and any imprisonment can last no longer than that session. State legislatures also have limited powers to punish for contempt. See R. L. Goldfarb, *Contempt Power* (1963; repr. 1971).

Conti (kōN-tē'), cadet branch of the French royal house of BOURBON. Although the title of prince of Conti was created in the 16th cent., the founder of the continuous line was Armand de Bourbon, prince de Conti, 1629-66, son of Henry II de Condé (see under CONDÉ, family) and brother of Louis II de Bourbon, prince de Conde, with whom he was in rivalry. Disappointed in his expectation of a cardinal's hat, Armand led rebel armies during the first FROVDE, his brother supported the government. Lat-

er they joined together in the second Fronde. Armand was reconciled (1653) with the court and married (1654) a niece of Cardinal Mazarin. He was given command of the army in the Italian and Spanish campaigns (1654-57). Toward the end of his life he turned to religious mysticism and retired (1657) to his estates, where he wrote several theological and moral treatises. He was a friend and protector of Molière. His eldest son, Louis Armand I de Bourbon, died while young, and his next son, François Louis de Bourbon, prince de Conti, 1664-1709, succeeded. His debauchery and his mockery of Louis XIV caused him to be banished (1683) to Chantilly. He then joined the Hungarian campaign of Charles V of Lorraine. Later he returned to Louis XIV's service and fought in the Dutch War. In 1697 he competed unsuccessfully with Augustus II (Frederick Augustus I, elector of Saxony) for the Polish throne. Louis François de Bourbon, prince de Conti, 1717-76, French general, grandson of François, served in the War of the Austrian Succession under General Belle-Isle in Bavaria, and in 1744 he received command of the army in Piedmont. He also distinguished himself in the campaigns in Germany (1745) and Flanders (1746). He resigned his commission in 1747 and for a while was a candidate for the Polish throne. Disliked by Mme de POMPADOUR, however, he lost favor at court. In opposition to the king, he supported the PARLEMENT against René Nicolas de MAUPEOU, later he opposed the reforms of A. R. J. Turgot. He was a writer and a friend of Jean Jacques Rousseau. His son, the last of the line, Louis François Joseph, prince de Conti, 1734-1814, fought in the Seven Years War, notably at the battles of Hastenbeck (1757) and Krenfeld (1758). He was the only prince of the blood to favor the edicts of Maupeou (1771). He signed the protests of the princes in 1789 and left France, but he returned in 1790. He was arrested in 1793 and detained at Marseilles. In 1795 he was exiled to Spain.

continent, largest unit of land on the EARTH. The continents include Eurasia (conventionally regarded as two continents, EUROPE and ASIA), AFRICA, NORTH AMERICA, SOUTH AMERICA, AUSTRALIA, and ANTARCTICA. The continents are not distributed regularly over the earth's surface. More than two thirds of the continental regions are in the Northern Hemisphere, rimming the Arctic Ocean. South America and Africa project into the Southern Hemisphere as southward-pointing triangles, forming extensive peninsular regions separating the Atlantic, Pacific, and Indian oceans. In addition, the continents are antipodal to the OCEAN basins, i.e., ocean basins are found on the opposite parts of the earth from continental masses. There is an antipodal relationship between the continental Antarctic region and the Arctic Ocean, and the Pacific Ocean comprises virtually an entire hemisphere of ocean water, while a hemisphere dominated by land is centered in NW Europe. The continental areas bounded by the sea level contour comprise about 29% of the earth's surface. However, from a geological point of view, the submerged continental shelves are also parts of the continents. Inclusion of the shelf area increases the extent of the continents to 34% of the globe. Geologically and topographically the continents are exceedingly complex and variable in detail, yet certain large-scale structural and topographic features appear to be common to all. Generally, the continents contain vast interior plains or plateaus, underlain by a basement complex of igneous and metamorphic rocks of PRECAMBRIAN age. In some places, the basement complex is exposed at the surface, where it is often called the shield, or craton. The Canadian Shield area of E Canada is the exposed basement complex of North America. Portions of shield areas are covered with veneers of flat-lying sedimentary rocks of younger age. The interior plains are frequently surrounded on one or more sides by ranges of mountains. These mountains are largely composed of younger sedimentary rocks that have been intricately folded and faulted and are approximately aligned parallel to the coasts. They also display abundant evidence of volcanic activity and large-scale igneous intrusions. In the United States the folded Appalachian Mts. lie to the east of the interior plains and the Rocky Mts. to the west. The Rockies are huge granitic masses that pushed upward through overlying sedimentary rocks which were then eroded away. How the continents originated has been a continuous major problem of geology. The oldest continental rocks dated by radioactivity are 3.98 billion years old, which suggests that the continents and oceans are probably permanent features of the earth's surface. Although the continental regions have been periodically covered

by shallow seas, they appear never to have been the sites of ocean depths. Radioactive dating has also revealed that the rocks of the continental shields occur in large belts, with structures similar to those found in more recent mountain ranges. The oldest rocks are found in the interior, central portion of a shield. These discoveries suggest that the central shield areas of continents originally formed close to the time that the earth's crust first solidified and that the process of continental formation, or accretion, is continuing today. Accretion occurs on the edge of a continent where huge plates of the earth's crust are converging. The rocks in the area of convergence are crushed by the plates and thrown up against the continents in the form of mountains (see PLATE TECTONICS). The continents are composed mainly of granitic rocks, called sial (from a contraction of the names of the two chief constituent elements, silicon and aluminum). Underlying the ocean floor and the sial layer of the continents are denser basaltic rocks called sima (a contraction of silicon and magnesium). The sial and sima form the crust of the earth. Below the crust lies a region of the earth called the mantle. Although the crust is entirely solid, evidence indicates that part of the mantle consists of semimolten rocks on which the continents and ocean basins, in effect, are floating. A condition of gravitational balance, called isostasy, exists between different parts of the earth's crust. The theory of isostasy claims that the continental crust floats higher than the oceanic crust because the former is composed of a thick layer of lower density rocks while the latter is composed of a thin layer of higher density rocks. It is believed that isostatic adjustments for changes in mass distribution on the earth's surface occur through a flow of semimolten materials deep in the earth. These materials cause a compensatory uplift of mountains and plateau areas as erosion wears them down. The mass of eroded material is added to and thus depresses the continental shelves and the ocean floor. Adjustments to maintain equilibrium also accompany such mass changes as the growth and melting of ice sheets on continents. The average land elevation is c. 2,700 ft (820 m) above sea level, the highest point on any continent being the summit of Mt. Everest at 29,028 ft (8,848 m), and the lowest point being the surface of the Dead Sea at 1,292 ft (394 m) below sea level. See CONTINENTAL DRIFT.

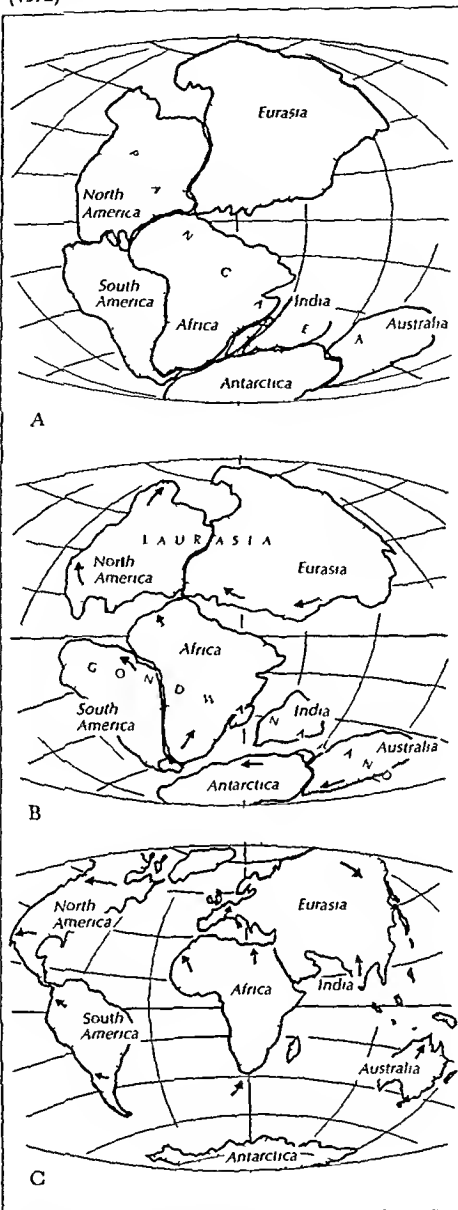

Continental Congress, 1774-89, Federal legislature of the Thirteen Colonies and later of the United States in the AMERICAN REVOLUTION and under the Articles of Confederation (see CONFEDERATION ARTICLES OF). Indignation against England's colonial policy reached fever pitch in the colonies after the passage (1774) of the INTOLERABLE ACTS, and the Sons of Liberty and the committees of correspondence promoted the idea of an intercolonial assembly similar to the one held (1765) at the time of the STAMP ACT. The First Continental Congress (Sept. 5-Oct. 26, 1774) was made up of delegates from all the colonies except Georgia. It met in Carpenter's Hall, Philadelphia, and Peyton Randolph was chosen to preside. The meeting's general purpose was to express colonial grievances against British policy, and only a few radical members considered the possibility of breaking with England. The plan of Joseph GALLOWAY for reconciling Great Britain and the colonies under a new imperial scheme was introduced but rejected. The session's most important act was the creation of the Continental Association, which forbade importation and use of British goods and proposed prohibition of colonial exports. Several petitions of grievances, written principally by John DICKINSON, were sent to the king, and the meeting was adjourned until May 10, 1775. Smoke from the battles of Lexington and Concord (April 19, 1775) had scarcely cleared when the Second Continental Congress met on the appointed day in Philadelphia. Armed conflict strengthened the radical element, but only gradually did the delegates swing toward independence. A Continental army was created to oppose the British and, through the agency of John ADAMS, George Washington was appointed (June 15, 1775) commander in chief. The reconciliation plan offered (1775) by Lord North's government was tabled. A diplomatic representative, Silas DEANE, was sent (March, 1776) to France. American ports were opened in defiance of the Navigation Acts. Finally, the momentous step was taken. Congress on July 4, 1776, adopted the DECLARATION OF INDEPENDENCE. The Congress, a young and unsteady organization, had little money and poor means of obtaining more. Nevertheless, it struggled to press the conduct of the war while moving under force

of military circumstances, from place to place, it met at Philadelphia (1775-76), Baltimore (1776-77), Philadelphia again (1777), Lancaster, Pa (1777), York, Pa (1777-78), and Philadelphia once more (after 1778). There was friction between Congress and the military leaders, and the soldiers, contemptuous (sometimes justly) of the politicians, constantly agitated for their pay and their rights. The Congress, jealous of its powers, frequently hindered Washington in his strategy. After the war ended and the Articles of Confederation took force, the quality of Congressional membership declined, since state offices were more desirable, and the Congress itself eventually dissolved. The Congress of the postwar period has, however, been underrated by many. Though shackled by the weaknesses of the Federal structure, which sharply curtailed its power and particularly its ability to raise funds, the Congress can be credited with some accomplishments—notably the Ordinance of 1787, which set up the Northwest Territory, decision of the WYOMING VALLEY territorial dispute, and adoption of the decimal system of currency. See *Journals of the Continental Congress* (34 vol., 1904-37), *Letters of Members of the Continental Congress* (ed. by E. C. Burnett, 6 vol., 1921-33, repr. 1963), E. C. Burnett, *The Continental Congress* (1941, repr. 1964), Lynn Montross, *The Reluctant Rebels: The Story of the Continental Congress, 1774-1789* (1950, repr. 1970).

Continental Divide, the "backbone" of a continent. In North America, from N. Alaska to New Mexico, it is the great ridge of the Rocky Mts., which separates westward-flowing streams from eastward-flowing waters. In SW New Mexico the divide crosses an area of low relief, it becomes more distinct in N. Mexico, where it follows the Sierra Madre Occidental. In the United States it has sometimes been called the Great Divide, a name also occasionally used to designate the whole Rocky Mt. system, especially the southern section where the high, rugged ranges presented an almost impenetrable barrier to westbound explorers and settlers. Glacier, Yellowstone, and Rocky Mt. national parks lie on the Continental Divide.

continental drift, geological theory that the positions of the continents on the earth's surface have changed considerably through geologic time. The first comprehensive and modern theory of continental drift was put forth by the German meteorologist Alfred Wegener in 1912. He cited as evidence the jigsaw fit of the opposing Atlantic coasts, particularly in the region of the coast of Brazil and the Gulf of Guinea of Africa. Wegener was particularly exacting and detailed in correlating geological and paleontological similarities on the two sides of the Atlantic to strengthen his argument. On the basis of the correlations he believed that late in the Paleozoic era, which ended 225 million years ago, all the continents were united into a vast supercontinent, which he called Pangaea. Later, Pangaea broke into two supercontinental masses—Laurasia to the north, and Gondwanaland to the south. The present continents began to split apart early in the next era, the Mesozoic, drifting to their present positions. As additional evidence he cited the unusual presence of coal deposits in South Polar regions and of glacial features in present-day equatorial regions. He also pointed out that a plastic layer in the interior of the earth must exist to accommodate vertical adjustments caused by the creation of new mountains and by the wearing down of old mountains by erosion (see CONTINENT). He postulated that the earth's rotation caused horizontal adjustment of rock in this plastic layer, exerting forces against the roots of the continents. These forces send the continents drifting on the "sea" of the basaltic ocean floor on which they rest. The mystery of mountain building was thus explained by Wegener as resulting from frictional drag along the leading edges of the drifting continents. Wegener's theory stirred considerable controversy throughout the 1920s, but was not generally accepted, particularly by American geologists, and later became the butt of ridicule. In 1954 the theory of continental drift was revived when a group of British geophysicists reported on magnetic studies of rocks from many places and from each major division of geologic time. They found that for each continent, the magnetic pole had apparently changed position through geologic time, forming a smooth curve (or pole path), they called this phenomenon polar wandering. Surprisingly, they found that each continent had its own pole path, and that the pole paths for Europe and North America could be made to coincide by closing the Atlantic Ocean, thus bringing the continents together. They could

explain these findings only by assuming continental movements. See PLATE TECTONICS. See Hitoshi Takeuchi et al., *Debate About the Earth* (1967), D. H. Tarling, *Continental Drift* (1971), J. T. Wilson, ed., *Continents Adrift: Readings From Scientific American* (1972).

Continental System, scheme of action adopted by NAPOLEON I in his economic warfare with England from 1806 to 1812. Economic warfare had been carried on before 1806, but the system itself was initiated by the BERLIN DECREE and extended by the Warsaw Decree (1807), the MILAN DECREE (1807), and the Fontainebleau Decree (1810), which forbade trade with Great Britain on the part of France, her allies, and neutrals. Napoleon expected that the unfavorable trade balance and loss of precious metals would destroy England's credit, break the Bank of England, and ruin English industry. Great Britain retaliated by the ORDERS IN COUNCIL, which forbade nearly all trade between England and any nation obeying the Berlin Decree. One of the most dramatic results of the commercial warfare was the English bombardment of neutral COPENHAGEN (1807) and the seizure of the Danish fleet. England had control of the sea, and large-scale smuggling thrived

all along the European coast (with U.S. privateers taking a large part in the illegal trade). Napoleon himself issued special licenses for trade bringing in colonial goods on the payment of duties. Napoleon's Russian campaign of 1812 was brought on by Russia's refusal to conform to the decrees, and the war between England and the United States, known as the WAR OF 1812, was to some extent a result of the economic warfare. But so difficult was the enforcement of the system that in his effort to impose it on Russia, Napoleon had to violate it in France. Napoleon's failure, although it delayed the introduction of the Industrial Revolution in France, resulted in the creation of several new industries on the Continent, notably the manufacture of beet sugar. See F. E. Melvin, *Napoleon's Navigation System* (1919), E. F. Heckscher, *The Continental System* (1922).

continuation school: see VOCATIONAL EDUCATION

contour or **contour line**, line on a map connecting points of equal elevation above or below mean sea level. It is thus a kind of isopleth, or line of equal quantity. Contour lines are drawn on maps with a uniform interval of vertical distance separating them (usually 10, 20, 50, or 100 ft on American maps) and thus outline the landform configuration, or relief. They may be visualized as representing shorelines if sea level were raised in small increments. Thus the tops of hills, which would appear as separate islands, are shown as a series of closed circular contours, valleys, which would appear as elongate bays, are shown as contour lines converging toward a point at the head of the valley. Since on steep slopes there is little horizontal distance between points greatly different in height, contour lines indicating such terrain are close together, contour lines of gentle slopes are more widely separated. Maps employing contour lines are called contour, or relief, maps although they are popularly called topographic maps (see TOPOGRAPHY) in the United States. Certain conventions are employed on these maps to assist the user. Contours indicating land elevations are printed in brown with every fifth contour drawn thicker and labeled with its elevation, those indicating depths of bodies of water are printed in blue. Hachure lines, pointing downslope, are attached to contour lines in order to emphasize a depression with a steep gradient. In the past, contour maps were made from ground surveys, but today they are constructed from stereographic aerial photographs after ground parties have established the precise location and elevation of selected reference points.

contraband, in international law, goods necessary or useful in the prosecution of war that a belligerent may lawfully seize from a neutral who is attempting to deliver them to the enemy. The term is sometimes also applied to the goods carried into a country by SMUGGLING. The penalty for carrying contraband goods is the confiscation of the goods and often also of the vessel (see PRIZE). Neutral ships guilty of direct assistance to the enemy may be treated as enemy ships. International law has not precisely defined all classes of goods that are contraband of war per se. Munitions are certainly absolute contraband, but the status of food and other conditional contraband at least indirectly needed for war is often in doubt. At the second (1907) of the HAGUE CONFERENCES a vain attempt to define the classes of contraband was made. In World War I many powers at first agreed to abide by the terms of the Declaration of London (see LONDON, DECLARATION OF) respecting contraband, but in time unconditional blockade of all goods was adopted. At the beginning of World War II the belligerents drew up lists of absolute and conditional contraband, but the total absorption of the economy in warfare led to the prohibition, so far as possible, of all shipping to the enemy. See P. C. Jessup, *The Early Development of the Law of Contraband of War* (1933).

contrabassoon, large, deep-toned instrument of the oboe family, also called double bassoon. Its tube, over 16 ft (5 m) long, is doubled upon itself four times. It was first made by Hans Schreiber of Berlin in 1620. Handel, Haydn, and Beethoven used it for special effects, but it was characterized by faulty intonation until a German, Wilhelm Heckel, in the late 19th cent. made the type generally used today.

contraception: see BIRTH CONTROL

contract, in law, a promise, enforceable at law, to perform or to refrain from some specified act. In a general sense, all civil obligations fall under TORT or contract law. Torts are usually characterized as violations of duties that have been entirely established by law. In contracts, on the other hand, the parties determine, at least in part, what their obligations to

one another will be. This article considers contracts in general, special types are given separate articles, e.g., **NEGOTIABLE INSTRUMENT**, **INSURANCE**, and **DEED**. For a contract to be valid both parties must indicate that they agree to its terms. This is accomplished when one party submits an offer that the other accepts within a reasonable time or a stipulated period. If the terms of the acceptance vary from the offer, that acceptance legally constitutes a counteroffer, the original offering party may then accept it or reject it. At any time prior to acceptance, the offer may be rescinded on notice unless the offering party is bound by a separate option contract not to withdraw. If the parties conduct their negotiations by mail or telegraph, the contract is ordinarily concluded on the day the acceptance is dispatched, in some jurisdictions, however, the offering party may revoke any time prior to receipt of the acceptance at his usual place of business. Only those terms expressed in the contract can be enforced, secret intentions are not recognized. For a contract to be binding it must not have an immoral or a criminal purpose or be against **PUBLIC POLICY**. Other criteria for the enforcement of contracts have varied. In the earliest type of enforceable promises it was the form of the contract (e.g., a sealed instrument) or the ceremony accompanying its execution that marked the essence of the transaction, contracts not sealed or not dignified by ceremonies held a lesser status and were therefore not always enforceable. The importance of promises in commercial and industrial society produced a new criterion, and generally a promise is now enforceable only if it is made for some consideration, i.e., in exchange for some action or for another promise. In some jurisdictions statutes have made certain promises enforceable without consideration, e.g., promises to pay debts barred by the statute of limitations. To be enforceable, applicable contracts must also comply with the Statute of Frauds (see **FRAUDS, STATUTE OF**), a law that exists in some form in every jurisdiction. Since a contract is an agreement, it may be made only by parties with the capacity to reach an understanding. Therefore, the insane and the feeble-minded are unable to make binding contracts. Until the late 19th cent. married women were also without contractual capacity, because at common law they were considered the creatures of their husbands and without wills of their own (see **HUSBAND AND WIFE**), this disability has been removed by statute all but universally. Minors are not bound by their contracts, but they are responsible for the value of goods received in contracts made for necessities of life. Otherwise, a minor may denounce his contracts at any time and on attaining majority may elect whether to affirm or repudiate them (see **AGE OF CONSENT**). A contract must also be the uncoerced agreement of the parties, thus, if it is procured by **DURESS** or **FRAUD** it is void. While a contract is still wholly or partly unperformed it is termed executory, contracts may terminate, however, in ways other than by being fully executed. If the object of the contract becomes impossible or unlawful, if the parties make a novation (a new superseding agreement), or if the death of one party prevents him from rendering personal services he had agreed to perform, the contract is terminated. The injured party may also treat the

contract as a nullity if the other party refuses to perform. The law provides several remedies for breach of contract. The most usual is **MONEY DAMAGES** for the loss incurred. In cases where some action other than the payment of money was contracted for, a court may grant the plaintiff an **INJUNCTION** ordering specific performance. If one party may be unjustly enriched by a contract that he then repudiates, restitution may be required. A typical example of this is ordering a minor who revokes a contract to restore the things of value that he obtained. In some jurisdictions a contract made for the benefit of a third party may be enforced by the beneficiary against the defaulting party. See A. L. Corbin, *Contracts* (1952), studies by G. C. Cheshire (7th ed. 1969) and F. Kessler (2d ed. 1970).

contract bridge, see **BRIDGE**

contraction, in physics, see **EXPANSION**

contraction, in writing, see **ABBREVIATION**

contralto (kəntrāl'tō), female voice of lowest pitch. Originally, the term denoted a second voice set against (*contra*) a high voice (*alto*), thus, a second high voice. Since most second parts were for a high male voice or a low woman's voice, the term came to mean a low woman's voice. See also **ALTO**, **COUNTERTENOR**, **VOICE**.

Contreras (kōntrā'rās), village, central Mexico, near Mexico City, site of an important battle (Aug. 19-20, 1847) of the Mexican War. Gen. Winfield Scott, continuing his advance after the battle of Cerro Gordo, approached Mexico City. The Mexicans under General Santa Anna were drawn up for defense. Scott sent out a reconnaissance party under Gideon Pillow, who mistakenly ordered an attack that ended by isolating some of his advance troops. The situation seemed desperate, but brilliant night tactics, supported by reestablishment of communications by Robert E. Lee, prepared the way for a daybreak attack. Santa Anna was forced to retire to Chapultepec. Fierce fighting took place later on that same day at Churubusco, closer to Mexico City, where Mexican troops temporarily stemmed the U.S. advance.

controlled atmosphere storage, practice of storing articles in enclosures in which the atmospheric conditions such as temperature, pressure, humidity, and atmospheric composition, are optimized to prevent undesired changes in or deterioration of the stored articles. Refrigeration is a simple example of controlled atmosphere storage. Machine parts are often stored in air that is as dry as possible to protect them from rust. Substances that react readily with oxygen are often stored in atmospheres of nitrogen, carbon dioxide, or other relatively inert gases. Various fruits such as bananas and oranges are shipped and stored in an atmosphere of ethylene dioxide to retard their ripening.

control surface, see **AIRFOIL**

control systems, combinations of components (electrical, mechanical, thermal, or hydraulic) that act together to maintain actual system performance close to a desired set of performance specifications. Open-loop control systems (e.g., automatic toasters and alarm clocks) are those in which the output has no effect on the input. Closed-loop control systems (e.g., thermostats, engine governors, and aircraft and spacecraft automatic control systems) are those in which the output has an effect on the input in such a way as to maintain the desired output value. See **FEEDBACK**.

Contucci, Andrea, see **SANSOVINO, ANDREA**

convection, mode of heat transfer in fluids (liquids and gases). Convection depends on the fact that, in general, fluids expand when heated and thus undergo a decrease in **DENSITY** (since a given volume of the fluid contains less matter at a higher temperature than at the original, lower temperature). As a result, the warmer, less dense portion of the fluid will tend to rise through the surrounding cooler fluid, in accordance with **ARCHIMEDES' PRINCIPLE**. If heat continues to be supplied, the cooler fluid that flows in to replace the rising warmer fluid will also become heated and also rise. Thus, a current, called a convection current, becomes established in the fluid, with warmer, less dense fluid continually rising from the point of application of heat and cooler, denser portions of the fluid flowing outward and downward to replace the warmer fluid. In this manner, heat eventually may be transferred to the entire fluid. Convection currents are widely observed in both liquids and gases. Many aspects of weather are connected with convection currents. For example, when a portion of the atmosphere becomes heated by contact with a warm area of land, it rises into the

cooler, higher altitudes, with the result that some of the moisture carried with it may be condensed to form clouds and precipitation. Man has used convection currents for heating and ventilation since ancient times. Both hot-air and hot-water heating systems use convection to transfer heat through the entire structure being heated. Convection currents also assist in the ventilation of mines.

convector, see **HEATING**

convent, see **MONASTICISM**

convention, in U.S. politics, a gathering of delegates to nominate candidates for elective office and to formulate party policy. They are held at the national, state, and local levels. Conventions for nominating candidates for state offices were first held in the early 19th cent. The first national convention was held by the Anti-Masonic party in Baltimore in 1831. Formerly the candidates for President and Vice President were always selected by a caucus, i.e., a meeting of influential members of Congress from each party intended to promote the candidate favored in Congress. The Democrats soon followed the lead of the Anti-Masonic party, and in 1832 Andrew Jackson became the first successful candidate to be nominated at a national convention. The Republican party held its first national convention in 1856, when John Frémont was chosen as the presidential candidate. In the past, candidates were often selected only after many ballots had been taken. This was especially true of the Democratic party, which, until 1936, had required successful nominees to win two thirds of the delegates' votes. Thus, Stephen Douglas was nominated on the 59th ballot in 1860, Woodrow Wilson on the 46th ballot in 1912, and John W. Davis on the 103d ballot in 1924. The difficulty of gaining agreement on a candidate at conventions led to a unique feature of the American political scene, the **DARK HORSE**—a candidate with little or no formal support before the opening of the convention, who succeeded in gaining the nomination. Since 1960, however, national conventions have tended to ratify front-runner candidates rather than select from among evenly matched rivals. Although today the acceptance speech of the nominee is the recognized climax of the convention, it was not until Franklin Delano Roosevelt flew to Chicago to accept the Democratic nomination in 1932 that a nominee accepted the nomination in person. The organization of a national convention is the responsibility of the party's national committee, which begins making arrangements for the accommodation of hundreds of delegates and the administration of the convention at least a year in advance. Balloting at both the Republican and Democratic conventions is by states, and only one person at any time has the right to cast the votes for his state. Delegates are chosen by a variety of methods, including primary elections, state and local conventions, or state and local committee meetings. Although the two parties follow the same basic pattern of basing representation on the population of the state and the party's strength within the state, the Democratic party introduced a series of reforms after the 1968 convention that modified its traditional delegate selection system. A quota system, assuring proportional representation for women, youths, and blacks was used for the 1972 convention but subsequently discarded in favor of a general commitment to minority representation. A more lasting change was the abolition of the unit rule, which had been in effect since 1832 and which had required state delegations to cast their votes as a bloc for a single candidate. National political conventions have been criticized by members of both parties, especially those committed to some type of national presidential primary election. See P. T. David et al., *The Politics of National Party Conventions* (rev. ed. 1964), N. W. Polsky and A. B. Wildavsky, *Presidential Elections* (3d ed. 1971).

Contrabassoon

convict labor, work of prison inmates Until the 19th cent, labor was introduced in prisons chiefly as an added punishment and was often unproductive Such work is now considered a necessary part of the rehabilitation of the criminal, it is also useful in keeping discipline and reducing the costs of prison maintenance The main types of work in prison communities are maintenance activities, outdoor public works (farming, road building, reforestation), and industrial labor Considered a source of cheap labor, convicts were formerly put to work on contract, lease, or piecework bases for private industries In recent decades these methods have been condemned, and prison industries are devoted chiefly to the production of goods to be used in state institutions Because of competition with non-prison labor, interstate commerce in the products of convict labor has also been restricted in the United States since 1934 Wages are paid in many state and Federal prisons in the United States and in many European countries The notorious chain gangs of some Southern states, in which convicts were chained and forced to do heavy labor, have declined but have not disappeared Work release programs have been introduced with some success in France, Norway, Sweden, and the United States, whereby convicts are allowed to work outside prisons in private industry during the latter part of their prison terms, for this work the convict receives the same wages as nonprison workers

convolvulus (kən-vŏl'vū-ləs) see MORNING GLORY

convulsion, sudden violent involuntary contraction of the muscles of the body, often accompanied by loss of consciousness It is not known what causes the abnormal impulses from the brain that result in convulsive seizures, since the disturbance may arise in normal brain tissue as well as in diseased or injured tissue Convulsions may occur in such conditions as epilepsy, poisoning, high fever (especially in young children), disturbances of calcium or phosphorus metabolism, alkalosis, diabetes, oxygen insufficiency, and a low blood-sugar content, as well as in local irritation or injury of the brain Persons undergoing convulsions should be guarded against self-injury (see EPILEPSY) Otherwise, treatment must be directed to the underlying cause

Conway, Henry Seymour, 1721-95, English soldier and politician, nephew of Robert Walpole Early in his life he entered upon concurrent and distinguished military and parliamentary careers He fell into disfavor with George III for defending John Wilkes and was dismissed (1764) from his commands He served (1765-68) as a secretary of state and voiced his dislike of the STAMP ACT In 1782 he helped bring about Lord North's resignation for his handling of the struggle with the North American colonies

Conway, Sir Martin. see CONWAY OF ALLINGTON, WILLIAM MARTIN CONWAY, 1ST BARON

Conway, Moncure Daniel, 1832-1907, American author and preacher, b Stafford co, Va An ardent abolitionist, Conway lectured in England during the Civil War in the interests of the North Brought up as a Methodist, he became a Unitarian minister and later a preacher of free thought Besides editing and contributing essays to periodicals, he was the author of over 70 books, including a biography of Thomas Paine (1892), whose works he also edited (4 vol, 1894-96) See his autobiography (1904), biography by M E Burtis (1952), L D Easton, *Hegel's First American Followers* (1966)

Conway, Thomas, 1735-1800?, general in the Continental army in the American Revolution, b Ireland Educated in France, he was an officer in the French army before coming (1777) to America He fought valiantly as a leader of colonial forces at Germantown, but George Washington attempted to block his promotion from brigadier to major general as unfair to officers with longer service Congress nevertheless appointed him major general (Dec, 1777) and made him inspector general of the army His part in the intrigue known as the CONWAY CABAL was small, but he lost his command, resigned (1778), and returned to France

Conway, city (1970 pop 15,510), seat of Faulkner co, central Ark, in a farm and cotton area, inc 1873 It is a trade and industrial center Conway was settled (c 1865) near the site of a French trading post (c 1770) It is the seat of Hendrix College and the State College of Arkansas A lock and dam on the nearby Arkansas River are tourist attractions Conway Lake offers excellent hunting and fishing

Conway, municipal borough (1971 pop 12,158), Caernarvonshire, N Wales, at the mouth of the Conway River Conway is a picturesque town with sev-

eral notable old structures A high wall (13th cent) encloses the old town, and there is a 13th-century church and a 13th-century castle The Royal Cambrian Academy of Art occupies the Elizabethan mansion Plas Mawr In 1974, Conway became part of the new nonmetropolitan county of Gwynedd

Conway Cabal, 1777, intrigue in the American Revolution to remove George Washington as commander in chief of the Continental Army Washington had been defeated at Brandywine and Germantown, and Horatio GATES was flushed with success by his victory in the Saratoga campaign Some Congressmen and army officers favored Gates as commander in chief Gen Thomas CONWAY, personally irritated with Washington, wrote a letter to Gates severely criticizing Washington James WILKINSON of Gates's staff quoted to William ALEXANDER (Lord Stirling) a phrase purportedly from this letter, and Alexander repeated it to Washington, who sent the quotation to Gates without comment Gates wrote an elaborate defensive reply and sent it to Washington through Congress Public opinion supported Washington, and the plot—if such it was—came to nothing As it turned out, the much-quoted phrase was not in Conway's letter at all, and his name has been unfairly used to designate the cloudy scheme

Conway of Allington, William Martin Conway, 1st Baron, 1856-1937, English explorer, art historian, and writer Conway filled several university positions and in 1918-31 represented the combined English universities as Conservative member in the House of Commons He began mountain climbing at 16 and conducted expeditions of exploration in Spitsbergen (1896-97) and the Bolivian Andes (1898) His numerous books on art and exploration include *Mountain Memories* (1920), *Art Treasures of Soviet Russia* (1925), and *Giorgione as a Landscape Painter* (1929)

Conwell, Russell Herman, 1843-1925, American Baptist minister and lecturer, b Worthington, Mass After practicing law, he was ordained (1879) and went to Philadelphia as a minister He was founder and first president of Temple Univ, a college for working people that opened in 1884 For over 60 years Conwell was active as a lecturer See biography by A R Burr (1917)

cony see CONEY

Cooch Behar (kōōch bīhār'), former princely state, now part of West Bengal state, E India It lies in a low, poorly drained plain Rice, tobacco, and jute are grown Big-game hunting is practiced The chief town, Cooch Behar (1971 pop 53,734), is a district administrative center and market town

Cook, David J, 1840-1907, American law enforcement officer, b near La Porte, Ind He moved (1855) with his family to Kansas, went (1859) to the Colorado gold fields, and returned to enlist (1861) in the Union army in the Civil War Army service as a sort of military policeman led him to found the volunteer Rocky Mountain Detective Association to suppress outlawry in Colorado, and he had a long career as marshal, sheriff, and police chief, mostly around Denver He brought many train, bank, and express-company robbers to justice, helped to quell the Ute Indian revolt of 1878, and was arbitrator in the mine strike at Leadville in 1880 See his reminiscences (new ed 1958), biography by W R Collier and E V Westrate (1936)

Cook, Ebenezer, fl 1708, American author Virtually nothing is known about his life He is the author of *The Sot-Weed Factor* (1708), a satirical poem concerning an Englishman's visit to Maryland *Sotweed Redivivus* (1730), a treatise on tobacco production, is also attributed to him Cook is the central character in *The Sot-Weed Factor* (1960), a novel by John BARTH

Cook, Frederick Albert, 1865-1940, American explorer and physician, b Sullivan co, NY Cook early became interested in the arctic and accompanied the expedition of Robert E PEARY in 1891-92 as surgeon Later he accompanied the Belgian expedition (1897-99) to Antarctica and made other polar voyages In 1906, after unsuccessful attempts to reach the summit of Mt McKinley, Cook remained behind when most of the party returned He later announced that he and a companion had successfully scaled the peak, this assertion was afterward proved to be fraudulent In 1907 he set out with an expedition for the arctic, and on Sept 1, 1909, he emerged into civilization again, claiming that he had reached the North Pole in April, 1908 A few days later Peary announced that he had reached the pole in April, 1909, and accused Cook of fraud The argument was sensational Cook was deprived of some of the hon-

ors that had been accorded him and disappeared from the public eye for a time Later he was involved in an oil-field promotion scheme in Texas and served five years (1925-30) of a 14-year sentence for having used the mails to defraud To the end of his life, however, and in the face of a generally hostile public, Cook fought for vindication of his polar and Mt McKinley claims and even filed several libel suits He was supported by some well-known explorers as well as some ardent admirers Cook defended his claims in *My Attainment of the Pole* (1911) and *Return from the Pole* (ed by F J Pohl, 1951) See Theon Wright, *The Big Nail* (1970), Hugh Eames, *Winner Lose All* (1973)

Cook, George Cram: see GLASPELL, SUSAN

Cook, James, 1728-79, English explorer and navigator After an apprenticeship to a firm of shipowners at Whitby, he joined (1755) the royal navy He surveyed the St Lawrence Channel (1760) and the coasts of Newfoundland and Labrador (1763-67) Cook was commissioned a lieutenant in command of the *Endeavour* and sailed (1768) on an expedition to chart the transit of Venus, he returned to England in 1771, having also circumnavigated the globe and explored the coast of New Zealand, which he accurately charted for the first time, and the coast of E Australia He commanded (1772-75) an expedition to the South Pacific of two ships, the *Resolution* and the *Adventure* On this expedition he disproved the rumor of a great southern continent, explored the Antarctic Ocean and the New Hebrides, discovered New Caledonia, and by the observance of strict dietary and hygienic rules prevented scurvy, heretofore the scourge of long voyages Capt Cook sailed again in 1776 and, after a year in the South Pacific, rediscovered the Sandwich Islands and unsuccessfully searched the northwest coast of North America for a passage to the Atlantic On the return voyage he was killed by natives on the Hawaiian Islands See definitive edition of his journals, ed by J C Beaglehole (Vol I-III, 1955-67, Vol IV in prep), selections from journals, ed by A G Price (1958, repr 1969), biographies by Christopher Lloyd (1952, repr 1957), Alan Villiers (1967), and J C Beaglehole (1974), Alan Moorehead, *The Fatal Impact* (1966), bibliography by Maurice Holmes (1968)

Cook, Sir Joseph, 1860-1947, Australian statesman, b England A leader of the Free Trade party, he served as prime minister (1913-14) and later as minister of the navy (1917-21) and high commissioner to London (1921-27) He was Australian representative at the Paris Peace Conference and a delegate (1922-26) to the League of Nations

Cook, Thomas, 1808-92, English travel agent In Leicester in 1841 he founded the travel agency that bears his name The idea of the guided tour met with quick success, and by 1852 Cook had moved his office to London Shortly thereafter he set up (1856) his Circular Tour of Europe, and 10 years later he was arranging tours of the United States His most spectacular achievement was the transportation of an entire expeditionary force (18,000 men) up the Nile for the attempted relief of Gen Charles George GORDON in 1884

Cook, Mount, 12,349 ft (3,764 m) high, on South Island, New Zealand, in the Southern Alps, highest peak of New Zealand Tasman Glacier is on the southeastern side of Mt Cook

Cooke, Jay, 1821-1905, American financier, b Sandusky, Ohio He founded Jay Cooke & Company, which marketed the huge Civil War loans of the Federal government He later turned to railroad bonds and in 1870 undertook to raise \$100 million for the Northern Pacific and financed construction to Bismarck, N Dak The burden proved to be too great and continuing the financing became impossible In 1873, Cooke's New York branch closed its doors and helped to precipitate the Panic of 1873 See biographies by E P Oberholtzer (1907, repr 1968) and Henrietta M Larson (1936, repr 1968), Meade Minnigerode, *Certain Rich Men* (1927, repr 1970)

Cooke, Terence James, 1921-, American Roman Catholic clergyman, b New York City He was ordained in 1945 after earning a B A from St Joseph's Seminary in Yonkers, NY In 1957, Cooke was named secretary to Francis Cardinal Spellman and then became vice chancellor of the archdiocese of New York (1958), chancellor (1961), and auxiliary bishop (1965) Appointed cardinal and archbishop of New York (1968), Cooke led a campaign in the United States against legalized abortion

Cookeville, city (1970 pop 14,270), seat of Putnam co, N central Tenn, inc 1854 It is a farm trade cen-

ter with plants making filters, automobile accessories, brushes, clothing, and heating elements Tennessee Technological Univ is there

Cook Islands, group (1970 est pop 22,000), 90 sq mi (234 sq km), South Pacific, SE of Samoa It comprises two main groups, the Lower Cook islands (RAROTONGA, Mangaia, Atiu, Aitutaki, Mauke, Mitiaro, and Manuae and Te-Au-o-tu) and the Northern Cook islands (Nassau, Palmerston, Penrhyn, MANIHiki, Rakahanga, Pukapuka, and Suvarrow) Avarua on Rarotonga is the administrative center of the group Fruit juices, citrus fruits, clothing, copra, tomatoes, pearl shell, handicrafts, and jewelry are the principal exports Most imports come from New Zealand The Cook islands are Maoris, a branch of the Polynesian race, they generally work their own land The southern islands were probably occupied by the Polynesians c 1,500 years ago Spaniards visited the islands in the late 16th and early 17th cent Capt James COOK sighted some of the islands in 1773, others were not discovered until the 1920s The London Missionary Society was a powerful influence in the southern islands during the 19th cent The group was proclaimed a British protectorate in 1888 and was annexed by New Zealand in 1901 Although under New Zealand sovereignty, the Cook Islands achieved internal self-government in 1965 The government consists of a prime minister, a cabinet, a 22-member elected legislature, and a 15-member House of Arikis (hereditary chiefs) The latter is a purely consultative body whose members are appointed by the New Zealand High Commissioner for one-year terms New Zealand remains responsible for foreign affairs and defense, and the Cook islands are citizens of New Zealand The islands were formerly called the Hervey Islands

Cook Strait, channel, c 15 mi (24 km) wide, between North Island and South Island, New Zealand It was discovered in 1770 by Capt James Cook

Cooley, Charles Horton, 1864-1929, American sociologist, b Ann Arbor, Mich, grad Univ of Michigan (B A, 1887, Ph D, 1894), son of Thomas M. Cooley He taught in the sociology department at the Univ of Michigan after 1892, although his degree was in economics Cooley's major contribution to the field of sociology was his conceptualization of the "looking-glass self" (a concept that emphasizes the social determination of the self) and primary groups—e g, the family, the play group, or the neighborhood He wrote *Human Nature and the Social Order* (1902, rev ed 1922), *Social Organization* (1909), *Social Process* (1918), and *Sociological Theory and Social Research* (1930)

Cooley, Thomas McIntyre, 1824-98, American jurist, b near Attica, N Y He was a judge (1864-85) of the supreme court of Michigan and was the first chairman (1887-91) of the Interstate Commerce Commission His best-known work is *A Treatise on the Constitutional Limitations Which Rest upon the Legislative Power of the States* (1868, 8th ed 1927) Cooley argued that the U S Constitution contained not only direct limitations on the power of the states (e g, the prohibition in Article I, Section 10, against a state's impairing the obligations of contract) but also implied limitations that could be deduced from the political theory underlying the Constitution For example, from the division of American governments into executive, legislative, and judicial branches he inferred the freedom of the judiciary from legislative interference Cooley's study was highly influential in the early interpretation of the due process clause of the FOURTEENTH AMENDMENT to the Constitution He also wrote extensively on the law of torts and taxation See C E Jacobs, *Law Writers and the Courts* (1954, repr 1973)

Coolgardie, Australia see EAST COOLGARDIE GOLD FIELD, KALGOORIE

Coolidge, Calvin, 1872-1933, 30th President of the United States (1923-1929), b Plymouth, Vt John Calvin Coolidge was a graduate of Amherst College and was admitted to the bar in 1897 He practiced (1897-1919) law in Northampton, Mass, entered state politics as a Republican, and rose steadily in the party He served (1910-11) as mayor of Northampton, was a member of the Massachusetts state senate from 1912 to 1915 (its president after 1914), and was (1916-19) lieutenant governor before serving (1919-21) as governor Coolidge rose to national prominence when he used the militia to end the Boston police strike in 1919 In 1920 he was nominated as Republican candidate for the vice presidency and was elected with Warren G Harding After Harding died, Coolidge took (Aug 3, 1923) the oath of office as President Untouched by the scan-

dals of the Harding administration, he was easily elected to a full term in 1924 His personal honesty and New England simplicity appealed to the American people, and his unquestioning faith in the conservative business values of laissez faire reflected the national mood Coolidge's policies were aggressively pro-business Through his appointees he transformed the Federal Trade Commission from an agency intended to regulate corporations into one dominated by big business He twice vetoed (1927, 1928) the McNary-Haugen bill to aid agriculture and pocket-vetoed (1928) a bill for government operation of the Muscle Shoals hydroelectric plant The presence in his cabinet of Herbert C Hoover and Andrew W Mellon added to the business tone of his administration, and Coolidge supported Mellon's program of tax cuts and economy in government Through his public statements he encouraged the reckless stock market speculation of the late 1920s and left the nation unprepared for the economic collapse that followed Coolidge chose not to seek renomination in 1928 After leaving office he retired to Northampton to write newspaper and magazine articles and his autobiography (1929) As first lady, his wife, Grace A Goodhue Coolidge, was much admired for her poise and charm A selection of his press conferences was edited by H H Quint and R H Ferrell (1964) See biographies by C M Fuess (1940), D R McCoy (1967), Jules Abels (1969), and W A White (1938, repr 1973)

Coolidge, William Augustus Brevoort, 1850-1926, American mountaineer and historian of the Alps, b New York City A graduate of Exeter College, Oxford, and life fellow and later modern history tutor at Magdalen College, he ascended nearly all the highest Alpine peaks He spent most of his life in England and Switzerland His books include *The Alps in Nature and History* (1908)

Coolidge, William David, 1873-1975, American physical chemist, b Hudson, Mass, grad Massachusetts Institute of Technology, 1896 He joined the General Electric Company in 1905 and served as director of its research laboratory (1932-40) and as vice president and director of research (1940-44) He made special studies of X rays, invented an X-ray tube, and invented and developed ductile tungsten

Coolidge Dam, 249 ft (76 m) high, 920 ft (280 m) long, on the Gila River, SE Ariz, built 1927-28 It irrigates c 100,000 acres (40,470 hectares), half of which are Indian lands in San Carlos Reservation San Carlos Reservoir, formed behind the dam, lies above old Indian burial grounds and the former camp of Geronimo

coolie labor, term applied to unskilled laborers from Asia, especially from India and China With the discontinuance of slavery, the use of Chinese and Indian contract labor in British and French colonies increased Indenture of Indian coolies was usually for a term of five years, in return for wages, certain benefits, and the cost of passage, the terms were enforceable by penal sanctions At the expiration of their terms, the laborers were free to reindenture or to seek other employment They frequently became peasant proprietors, although they were entitled to return passage to India The practice was discontinued by the British Indian government, which in 1922 prohibited assisting the emigration of unskilled laborers, except to a few countries Emigration of Chinese coolies began c 1845, although it was nominally prohibited before 1859 Between these dates the conditions were notoriously bad, the victims were shipped mainly to Cuba and Peru, where they died by the thousands In 1859, Britain arranged with Canton for legal emigration to the British West Indies and elsewhere on five-year contracts In 1860 an Anglo-Chinese convention sanctioned such emigration to British territory, and the regulations were agreed to by the other powers in similar conventions The British Chinese Passenger Act of 1885 regulated British ships in the trade and resulted in the traffic's falling mainly into the hands of the Portuguese, under whom it resembled the African slave trade In 1904, Great Britain arranged with China the hiring of 50,000 Chinese laborers to work the Transvaal gold mines In the 19th cent large numbers of Chinese laborers went to California and Australia Opposition in Australia to this influx of cheap labor resulted in the passage of the Emigration Restriction Act for the gradual elimination of Asians from Australia, by providing that no one should be permitted to enter the country who failed to write 50 words in any prescribed language Coolie labor was important in building the first U S transcontinental railroad, but this type of immigration into the United States was practically

ended by the Chinese Exclusion Act of 1888 and by stringent Federal laws against contract laborers In 1904, Canada began to exclude coolie labor by charging a head tax of \$500 See P C Campbell, *Chinese Coolie Emigration to Countries within the British Empire* (1923, repr 1971)

cooling system, type of heat exchanger commonly incorporated in engines to reduce the heat generated by friction and by combustion of the fuel Engines of the internal-combustion type generate heat in the cylinders to such an extent that, if they are not cooled, the lubricating oil will be burned and serious damage will be done to the various parts through unevenness of expansion Most internal-combustion engines are either water- or air-cooled Around each cylinder and cylinder head of a water-cooled engine is a hollow jacket through which water is circulated to draw heat from the engine The heated water is passed into a radiator connected to the jackets The radiator transfers heat to the atmosphere from its large surface area, over which air is drawn by a fan and also, in a motor vehicle, by the vehicle's motion The cooled water then returns to the jackets around the engine In order to speed the initial warmup of the engine, thermostatic valves prevent water from entering the radiator until the engine reaches its correct operating temperature In very cold weather the water may freeze, cracking the radiator To prevent this, the water is mixed with certain chemicals (see ANTIFREEZE) In air-cooled engines a large cooling surface is provided by means of a number of fins which, as part of the cylinders and the cylinder heads, help to dissipate the heat Air is caused to flow over the fins by the motion of the engine, if on a motor vehicle, or by a fan, or by both Sometimes the heated water from the jackets of internal combustion engines or from other sources is cooled in a cooling tower The water is sprayed into the tower where it mixes with air, heat being dissipated when some of the water evaporates The rest of the water is recirculated Large sources of waste heat such as power plants use cooling towers to avoid thermally polluting lakes and rivers by sending hot water into them Rapidly moving machinery is frequently kept cool, as well as being lubricated, by running it in an oil bath In a rocket engine the exit nozzle is sometimes cooled by the fuel passing through coils around it to the combustion chamber Cooling systems in buildings are so devised as to purify the air and regulate its water content as well as to cool it (see AIR CONDITIONING) See also VENTILATION

Coomaraswamy, Ananda Kentish (a "nānda" kēn'-īsh kōōma'raswā'mē), 1877-1947, art historian, b Ceylon (now Sri Lanka) Coomaraswamy was active in educational movements in India After 1917 he became keeper of Indian and Islamic arts in the Museum of Fine Arts, Boston He is credited with having built up the museum's great Far Eastern collection He was critical of Western institutions and sought, as in his *Am I My Brother's Keeper?* (1947), to apply to them standards derived from Oriental philosophy and history Among his other books are *Dance of Siva* (1918), *History of Indian and Indonesian Art* (1927), *Elements of Buddhist Iconography* (1935), and *The Transformation of Nature in Art* (3d ed 1956) See the bibliography of his writings in I K Bharatha, ed, *Art and Thought* (1947), study by R F Livingston (1962)

Coon, Carleton Stevens, 1904-, American anthropologist, archaeologist, and educator, b Wakefield, Mass, grad Harvard 1925, Ph D 1928 From 1925 to 1939 he was engaged in fieldwork and anthropological research in Arabia, the Balkans, and N Africa, where he discovered (1939) the remains of a Neanderthal man He taught (1934-48) at Harvard and in 1948 became professor of anthropology at the Univ of Pennsylvania and curator of ethnology at the University Museum there Coon became a controversial figure with the publication of *The Origin of Races* (1962), in which he argued that certain races had reached the *Homo sapiens* stage of evolution before others, he said this would explain why different races achieved different levels of civilization His other writings include *The Seven Caves* (1957), *The Story of Man* (2d ed 1962), *The Living Races of Man* (1965), and *The Hunting Peoples* (1971)

coon: see RACCOON

coon cat, name for a breed of large domestic CATS (also called Maine cats), for the COATIMUNDI, and for the CACOMISTLE

coonhound, black-and-tan, breed of large HOUND developed in the United States It stands from 23 to 27 in (58-69 cm) high at the shoulder and weighs from 70 to 85 lb (32-38 kg) The dense, short coat is

coal black with tan markings above the eyes and on the muzzle, chest, and legs. The black-and-tan is descended from the old Virginia (American) foxhound and is bred especially for proficiency in hunting raccoons and opossums. It is a slow but methodical trailer, scenting with its nose to the ground much like a bloodhound. Once it has treed its quarry it gives voice until the hunter arrives. There are other varieties of coonhound closely related to the black-and-tan and also originally descended from the foxhound, e.g., the Walker, Trigg, redbone, bluetick, and Plott, but only the black-and-tan is recognized as a separate breed by the American Kennel Club. See DOG.

Coon Rapids, city (1970 pop. 30,505), Anoka co., SE Minn., on the Mississippi River, inc. 1952. It is a suburb of Minneapolis-St. Paul. It has an aerospace research facility and plastic and metallurgical industries. A junior college is there.

Cooper, Alexander. see under COOPER, SAMUEL.

Cooper, Alfred Duff, 1st Viscount Norwich of Aldwick, 1890-1954, British statesman and diplomat. Elected to Parliament as a Conservative (Unionist) in 1924, he served as secretary of state for war (1935-37) in the coalition cabinet and was first lord of the admiralty in 1938 when he resigned in protest against the Munich Pact. He returned to the cabinet as minister of information (1940-41) under Winston Churchill. Appointed resident minister of Far Eastern affairs in Singapore in Dec. 1941, he was recalled the following month, shortly before Singapore fell to the Japanese. From 1944 to 1947 he served as ambassador to France. He was raised to the peerage in 1952. Among his writings is an autobiography, *Old Men Forget* (1953).

Cooper, Anthony Ashley: see SHAFTESBURY, ANTHONY ASHLEY COOPER, 1ST EARL OF.

Cooper, Gary (Frank James Cooper), 1901-61, American film actor, b. Helena, Mont. His first important starring role in *A Farewell to Arms* (1933) was followed by such films as *Mr. Deeds Goes to Town* (1936), *Pride of the Yankees* (1942), *For Whom the Bell Tolls* (1943), and *Saratoga Trunk* (1944). Best known to his public as the shy, lanky man of the West, he won Academy Awards for his performances in *Sergeant York* (1941) and *High Noon* (1952). His later films include *Vera Cruz* (1954), *Friendly Persuasion* (1956), and *They Came to Cordura* (1959).

Cooper, James Fenimore, 1789-1851, American novelist, b. Burlington, N.J. He was the first important American writer to draw on the subjects and landscape of his native land in order to create a vivid myth of frontier life. In 1790 Cooper's family moved to Cooperstown, N.Y., a frontier settlement founded by his father near Otsego Lake. Sent to Yale at 13, Cooper was dismissed for a disciplinary reason in his third year. Soon after he went to sea, commissioned as a U.S. midshipman, he served until 1811, at which time he married and settled as a gentleman farmer. Cooper's literary career, which covers a period of 30 years and includes more than 50 publications, began in 1820 with the appearance of *Precaution*. Imitative of the English novel of manners, this book failed to gain an audience, but his next work, *The Spy* (1821), a patriotic story of the American Revolution, was an immediate success. With *The Pioneers* (1823), the first of the famous *Leatherstocking Tales*, and *The Pilot* (1823), an adventure of the high seas, Cooper's reputation as the first major American novelist was established. In 1826 he went to France, nominally as American consul at Lyons. He spent several years abroad, publishing such novels as *The Red Rover* (1827), *The Wept of Wish-ton-Wish* (1829), and *The Water-Witch* (1830), romances of American life on land and sea. In *Notions of the Americans* (1828) he defended his country to European critics, but upon his return home, repelled by what he saw as the abuses of American democracy, Cooper became the staunch social critic of American society. Such works as *The American Democrat* (1838) and the fictional *Home-ward Bound* and its sequel, *Home as Found* (both 1838), express the conservative, aristocratic social views that made him quite unpopular; his later life was filled with many quarrels and lawsuits over his works. In his most important novels, the group comprising the *Leatherstocking Tales*—which in order of the narrative are *The Deerslayer* (1841), *The Last of the Mohicans* (1826), *The Pathfinder* (1840), *The Pioneers* (1823), and *The Prairie* (1827)—Cooper skillfully dramatized the clash between the frontier wilderness and the encroaching civilization. Named for their chief character, the forthright frontiersman Natty Bumppo, nicknamed Leatherstocking, the

Leatherstocking Tales are notable for their descriptive power, their mastery of native background, and their romanticized portrayal of the American Indian. His later works include the novels *Atfloat and Ashore* and its sequel, *Miles Wallingford* (both 1844), and the Littlepage trilogy—*Satanstoe* (1845), *The Chainbearer* (1845), and *The Redskins* (1846)—a study of the conflict between the landholding and the propertyless classes in New York state, in which Cooper shows himself a traditional defender of the rights of property. Although Cooper has been criticized for his extravagant plots, his conventional characters, and his stilted dialogue, he nevertheless remains the first great American novelist, a vital and original writer of romances of the wilderness and of the sea and an astute critic of the growing and stumbling American democracy. See his correspondence (ed. by his grandson, J. F. Cooper, 2 vol., 1922, repr. 1971), biographical and critical studies by James Grossman (1949), R. E. Spiller (1931, repr. 1963), George Dekker (1967), T. R. Lounsbury (1882, repr. 1968), and J. P. McWilliams, Jr. (1972), bibliography by R. E. Spiller and P. C. Blackburn (1934, repr. 1969).

Cooper, Myles, 1737?-1785, 2d president of King's College (now Columbia Univ.), b. England, educated at Oxford. He was ordained a priest in 1761 and went to King's College (1762) as professor of moral philosophy and assistant to the president. In 1763 he was made president, succeeding Samuel Johnson. Although his early administration was marked by the founding of a grammar school, a medical school, and a hospital, with changes in the curriculum and great increase in prestige, the college experienced hardships during the American Revolution. Cooper was an active and vocal Loyalist, and in 1775 he was forced to flee before the patriots' hatred to a British warship in New York harbor. He returned to Oxford and lived out his life in England.

Cooper, Peter, 1791-1883, American inventor, industrialist, and philanthropist, b. New York City. After achieving success in the glue business, Cooper, with two partners, erected (1829) the Canton Iron Works in Baltimore. There he constructed the *Tom Thumb*, one of the earliest locomotives built in the United States. His success in trials on the Baltimore & Ohio RR probably saved that pioneer line from bankruptcy. During the next 20 years, Cooper expanded his holdings, becoming a leader in the American iron industry, and in 1870 he was awarded the Bessemer gold medal for rolling the first iron for fireproof buildings. Cooper invented and patented other practical devices and processes. His faith in the success of the Atlantic cable led him to invest heavily in the New York, Newfoundland, and London Telegraph Company after banks refused to finance the operation. He was president of this company for 20 years while he headed the North American Telegraph Company, which controlled more than half of the telegraph lines in the country. An outstanding leader in the civic affairs of New York City, Cooper led the successful fight to secure a public school system and did much to improve several of the municipal departments. His lasting monument is COOPER UNION in New York City, built after his own plans to provide for education for the working classes. He supported the GREENBACK PARTY in national politics, and in 1876 he was the party's presidential candidate, polling over 80,000 votes. Many of his addresses were collected in *Ideas for a Science of Good Government* (1883, repr. 1971). Abram S. HEWITT was his son-in-law, Peter Cooper Hewitt his grandson. See biographies by R. W. Raymond (1901), Allan Nevins (1935, repr. 1967), and E. C. Mack (1949).

Cooper, Samuel, 1609-72, one of the greatest English miniaturists. A student of Hoskins, he worked in London from c. 1642. He painted portraits of numerous celebrated Englishmen. His draftsmanship and unusual use of lighting made his vellum-on-card head-and-shoulder paintings remarkable. Specimens of his work are to be found at Windsor Castle, in the collections of the duke of Buccleuch and the duke of Devonshire (the latter containing the famous portrait of Cromwell familiar through engravings), in the Victoria and Albert Museum, London, in the Rijks Museum, and in the Metropolitan Museum of Art. His brother, Alexander Cooper, d. 1660, was for many years miniature painter at the court of Queen Christina of Sweden.

Cooper, Thomas, 1759-1839, American scientist, educator, and political philosopher, b. London, educated at Oxford. His important works include *Political Essays* (1799), the appendixes to the *Memoirs of Dr. Joseph Priestley* (2 vol., 1806), in which he reviews Priestley's life and works at length, *Lectures*

on the *Elements of Political Economy* (1826), *Treatise on the Law of Libel* (1830), and (as editor) *The Statutes at Large of South Carolina* (5 vol., 1836-39). Cooper emigrated to the United States in 1794 and, settling near his friend Joseph Priestley in Northumberland, Pa., was his partner in scientific research. As a supporter of the Jeffersonian opposition to the Federalists, he wrote many political pamphlets, especially against the Alien and Sedition Acts of 1798. Convicted under the acts, he was imprisoned and fined \$400, after his death this fine was repaid to his heirs. He taught at Dickinson College and the Univ. of Pennsylvania and was president (1820-33) of South Carolina College (now the Univ. of South Carolina). See Dumas Malone, *The Public Life of Thomas Cooper* (1926), J. N. Ireland, *A Memoir of the Professional Life of Thomas Abthorpe Cooper* (repr. 1970).

Co-operative Commonwealth Federation see NEW DEMOCRATIC PARTY.

Cooperative Extension Service, in the United States, publicly supported, informal adult education and development organization. Established in 1914, it consists of three levels of organization—Federal, state, and county. Its overall objective is to plan, execute, and evaluate learning experiences that will help people acquire the understanding, the abilities and capabilities, attitudes, and skills essential for solving farm, home, and community problems. This objective is met through educational programs that make use of research findings emanating primarily from the U.S. Dept. of Agriculture and the state land-grant colleges and universities.

cooperative movement, series of organized activities that began in the 19th cent. in Great Britain and later spread to most countries of the world, whereby people organize themselves around a common goal, usually economic. The term usually refers more specifically to the formation of nonprofit economic enterprises for the benefit of those using their services. An old and widespread form is the consumers' co-operative, in which people organize for wholesale or retail distribution, usually of agricultural or other staple products. Traditionally, membership is open, and anyone may buy stock. Goods are sold to the public as well as to members, usually at prevailing market prices, and any surplus above expenses is turned back to the members. Money is saved through direct channeling of goods from producer to consumer. Producers' cooperatives are manufacturing and distributive organizations, commonly owned and managed by the workers. Another development in such cooperatives has been the acquisition of failing manufacturing plants by labor unions, who run them on a cooperative basis. Agricultural cooperatives usually involve cooperation in the processing and marketing of produce and in the purchase of equipment and supplies. Actual ownership of land is usually not affected, and in this way the agricultural cooperative differs from the COLLECTIVE FARM. Agricultural cooperatives are often linked with cooperative banks and CREDIT UNIONS, which constitute another important type of cooperative. There is also cooperative activity in insurance, medical services, housing, and other fields. The origin of cooperative philosophy is found in the writings and activities of Robert OWEN, Louis Blanc, Charles FOURIER, and others. Its early character was revolutionary, but under the impact of such movements as Christian Socialism this aspect diminished. After some early 19th cent. experiments, consumers' cooperation took permanent form with the establishment (1844) of the ROCHDALE SOCIETY OF EQUITABLE PIONEERS in England. The cooperative movement has since had considerable growth throughout Great Britain and the Commonwealth, where local cooperatives have been federated into national wholesale and retail distributive enterprises and where a large proportion of the population has membership. Foods are the chief products handled, with insurance and banking activities next in importance. Outstanding examples of cooperative organization are found in the Scandinavian countries, Israel, the People's Republic of China, the Soviet Union, and France. In 1918, the Scandinavian Cooperative Wholesale Society was founded to allow these countries the opportunity to buy food products from other countries jointly. Throughout rural and urban Scandinavia, marketing and consumer cooperatives are common. In Israel, more than 50% of the rural population is organized into agricultural cooperatives. After the successful Communist revolution in China in 1949, large-scale efforts toward cooperative organization were begun, by the mid-1950s more than 90% of all craftsmen were in coop-

eratives, and by 1958 all agriculture was cooperatively organized. The Soviet Union, which organized its economy along cooperative lines earlier than China, did not achieve the rapid success of the Chinese. France, with a long history of cooperative attempts for both consumers and producers, has gained the most success with agricultural cooperatives (e.g., over 80% of all French grain is sold through cooperatives). The cooperative movement began in the United States in the 19th cent., first among workers and then among farmers. The National Grange, a farmers cooperative was founded in 1867 and later exercised considerable political influence (see GRANGER MOVEMENT). Today the major types of cooperatives include those of farmers, wholesalers, and consumers, as well as insurance, banking and credit, and rural electrification cooperatives (the growth of the latter two facilitated by loans from the Federal government). Although cooperatives are more prevalent in the rural areas of the United States, by the early 1970s a large increase in cooperative apartment buildings and supermarkets in urban areas was evident. An international alliance for the dissemination of cooperative information was founded in 1895. Since then there has been increasing international collaboration among the various kinds of cooperatives and a growing trend toward the establishment of international cooperative distribution. See Laszlo Valko, *International Handbook of Cooperative Legislation* (1954); International Labor Organization, *Cooperative Management and Administration* (1960); H. J. Voorhis, *American Cooperatives* (1961); F. C. Helm, *The Economics of Co-operative Enterprise* (1968); E. P. Roy, *Cooperatives, Today and Tomorrow* (1969).

Cooperstown, residential village (1970 pop. 2,403), seat of Otsego co., E central N.Y., on the Susquehanna River and Otsego Lake, inc. 1807. It was founded by William Cooper, who brought his family there in 1787. His son, James Fenimore Cooper, made his home in Cooperstown after his return from abroad in 1833, and the region is described in his *Leatherstocking Tales*. Fenimore House is the headquarters of the New York State Historical Association. Other museums include Cooperstown Indian Museum, Farmers' Museum, and the National Baseball Hall of Fame and Museum, commemorating the founding (1839) of baseball there by Abner Doubleday. Glimmerglass State Park is nearby.

Cooper Union, accredited institution of higher education, in New York City, coeducational, chartered and opened in 1859. Founded by Peter Cooper, it pioneered in evening engineering and art schools, day schools were added in 1900. Today it includes the School of Engineering and Science, the School of Art and Architecture, and the Division of Adult Education. There are no tuition, application, matriculation, or graduation fees for U.S. residents. The Cooper-Hewitt Museum of decorative art and design was founded in 1897 as part of Cooper Union by Sarah, Eleanor, and Amy Hewitt, granddaughters of Peter Cooper. In 1967 the museum, still located in New York City, became an independent division of the Smithsonian Institution.

Coorg (kōōrg), former state, 1,593 sq mi (4,126 sq km), Karnataka state, SW India. Macara was the capital. Situated mainly in the hilly Western Ghats, the Coorg region produces coffee and timber, rice is the principal lowland crop. An independent Hindu dynasty ruled Coorg from the late 16th cent. until it was annexed by the British in 1834. It was administered by a British chief commissioner until India became independent in 1947.

Coornhert, Dirck Volckertszoon (dūrk vōl'kə-rtzōn kōrn'hārt), 1522-90, Dutch humanist. His translation (1561) of the first 12 books of the *Odyssey* is considered the first major poetic work of the Dutch Renaissance. Coornhert also translated Cicero, Boccaccio, Seneca, and Boethius. His comedies, morality plays, and a philosophical treatise (1586) express his stoic and humanistic ideas. Coornhert, who had witnessed the methods of the Inquisition, was an active supporter of religious tolerance, his pamphlet (1585) on this subject led to his imprisonment and exile. He eventually returned to Holland and died at Gonda.

Coos (kō ōs), island in the Aegean Sea, the present-day Kōs. Acts 21:1.

Coosa (kōō'sā), river, 286 mi (460 km) long, rising in NV Ga. and flowing SW through E Ala., joining the Tallapoosa near Montgomery, Ala., to form the Alabama River. Locks and dams make the river navigable for barges to Rome, Ga. Jordan, Lay, and Mitchell dams on the river generate electricity.

Coos Bay (kōōs), city (1970 pop. 13,466), Coos co., SW Oregon, a port of entry on Coos Bay, founded 1854 as Marshfield, inc. 1874, renamed 1944. Lumbering, shipping, tourism, fishing, and canning are important industries. Coos Bay is one of the world's largest lumber-shipping ports. A junior college is in the city.

coot, common name for a marsh bird related to the rail and the gallinule and found in North America and Europe. The American coot (*Fulica americana*), or mud hen, is sooty gray with a white bill, black head and neck, and white wing edgings and tail patch. It has lobed toes and is a skillful swimmer and diver but takes flight awkwardly, pattering the water to gain impetus. It eats aquatic plants. Some scoter ducks are called coots. The European species inhabits the northern regions, there are seven species in South America alone. The horned coot is found high in the Andes. Coots are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Gruiformes, family Rallidae.

copaiba (kōpā'ba, -pī'-), oleoresin (see RESIN) obtained from several species of tropical South American trees of the genus *Copaifera*. The thick, transparent exudate varies in color from light gold to dark brown, depending on the ratio of resin to essential oil. Copaiba is used in making varnishes and lacquers.

copal (kō'pal), RESIN produced by certain trees of tropical and subtropical regions. It is procured chiefly in fossil and semifossil form, but some is also obtained from living trees. Most copals come from leguminous trees of the PULSE family, e.g., the Congo copal and other African types (mostly of the *Copaifera* species) and the South American copals (chiefly *Hymenaea courbaril*). East Indian or Manila copal is extracted from a pine (*Agathis alba*). A source of hard-surfaced lacquers and varnishes, copals are no longer widely used commercially.

Copān (kōpān'), ruined city of the MAYA, W Honduras, near the village of Copan. Noted for fine sculptured stelae and in particular for the Hieroglyphic Stairway (containing nearly 2,000 glyphs), Copan was, perhaps, the center of knowledge where Mayan astronomical learning, as applied to chronology, achieved its most accurate expression.

Cope, Edward Drinker, 1840-97, American paleontologist and comparative anatomist, b. Philadelphia, studied at the Academy of Natural Sciences, Philadelphia, and at the Smithsonian Institution. His large collection of fossil mammals is now at the American Museum of Natural History. His many published works include *The Vertebrata of the Tertiary Formations of the West* (1883), a report on the F. V. Hayden survey in which he served as geologist and paleontologist. Cope believed that evolution arose from an organism's inner urge to attain a higher state of being. See biography by H. F. Osborn and H. A. Warren (1931).

Copeau, Jacques (zhak kōpō'), 1879-1949, French theatrical producer and critic. A founder (1909) and editor (1912-14) of the *Nouvelle Revue française*, he established the experimental Théâtre du Vieux Colombier in Paris (1913-24) in order to produce poetic drama of artistic worth. Copeau, an influential figure in the modern theater, encouraged many young dramatists and actors and also introduced the use of symbolic scene design. See Wallace Fowlie, *Dionysus in Paris* (1960).

Copenhagen (kō'panhā'gən), Dan. *København*, city (1971 pop. 625,678), capital of Denmark and of Copenhagen co., E Denmark, on E Sjælland and N Amager islands and on the Øresund. It is a major commercial, fishing, and naval port and is Denmark's chief commercial, industrial, and cultural center. It is also a rail hub. Manufactures include pharmaceuticals, processed food, beer, textiles, plastics, marine engines, furniture, and the celebrated COPENHAGEN WARE. There are also iron foundries and large shipyards. Copenhagen was a trading and fishing center by the early 11th cent. It was fortified (1167) by Archbishop Absalon and was chartered (1254) by the bishop of Roskilde. The city was twice destroyed by the Hanseatic League but successfully resisted (1428) a third attack. Copenhagen replaced Roskilde as the Danish capital in 1443. The city exacted tolls from all ships passing through the Øresund until 1857. Having resisted (1658-59) a Swedish siege, Copenhagen was relieved by the Dutch. In 1660 peace between Denmark and Sweden was negotiated there. The city had expanded considerably in the 16th and 17th cent. as its trade grew, and it continued to develop in the 18th cent. as industries such as textile making and tobacco processing brought added prosperity. Copenhagen

became involved in the war between Napoleonic France and England in the early 19th cent. The news that Denmark, by a secret convention, was about to join Napoleon's CONTINENTAL SYSTEM and to join in the war on England led the British government to decide to send an expeditionary force to seize the Danish fleet, which already had been mauled (1801) in the battle of Copenhagen. When the Danes refused to surrender, the British landed troops in 1807 and severely damaged Copenhagen by bombarding it. However, the city recovered quickly after the Napoleonic Wars, and its industrial base grew rapidly in the 19th cent. In World War II, Copenhagen was occupied (1940-45) by the Germans, and its shipyards were bombed by the Allies. The city itself was only slightly damaged, and it retained the charm and design that had resulted in its being called "the Paris of the North." The inner harbor of Copenhagen is the channel that divides Sjælland and Amager islands. From the harbor extends a narrow arm, the Nyhavn [new harbor], lined with picturesque old houses and closed off by Kongens Nytorv, an irregular square from which the main arteries of the city radiate. The Charlottenborg Palace (17th cent.) and the royal theater (opened 1874) are on Kongens Nytorv. Other famous landmarks of the city include Amalienborg Square, enclosed by four 18th-century palaces, one of which has been the royal residence since 1794, the citadel (c. 1662), the city hall (1894-1905), the famous round tower, which the astronomer Tycho Brahe (1546-1601) used as an observatory, and the Cathedral of Our Lady (c. 1209, rebuilt in the early 19th cent.), with sculptures by Albert 8 Thorvaldsen (1768-1844). The island of Slotsholmen, surrounded by a moat on three sides and by the harbor on the fourth, supports an impressive complex of buildings, notably Christiansborg Palace (18th cent., restored 1916), erected on the site of Archbishop Absalon's original castle and now housing the Danish parliament, supreme court, and foreign office, the Thorvaldsen Museum (opened 1848), and the stock exchange (17th cent.). Favorite spots in the city include the Tivoli amusement park (opened 1843) and the waterfront Langelinie Promenade, near which is the famous statue of Hans Christian Andersen's *Little Mermaid*. Copenhagen is the seat of a university (founded 1479), a technical university (1829), an engineering college, and a college of veterinary science and agriculture. Frederiksberg and Gentofte are Copenhagen's largest suburbs and, although independent municipalities, are intimately tied to the life of the city. Frederiksberg is the seat of the Royal Copenhagen Porcelain factory (established 1651).

Copenhagen, battle of, 1801, an important incident of the FRENCH REVOLUTIONARY WARS. In Dec., 1800, Denmark joined Russia, Sweden, and Prussia in declaring the armed neutrality of the northern powers in the French Revolutionary Wars and in announcing that they would not comply with the British rules on neutral navigation. England considered this a threat and, without declaring war, sent a fleet under admirals Sir Hyde PARKER and Horatio NELSON into the Baltic. On April 2, 1801, Nelson attacked the Danish fleet at the roadsteads of Copenhagen. During the battle he deliberately fixed the telescope to his blind eye, thus ignoring Parker's signal to discontinue action, and destroyed the Danish fleet after a hard battle.

Copenhagen ware, several types of pottery, both underglaze and overglaze, produced in Copenhagen since c. 1760. At that time a Frenchman, Louis Fournier, made soft-paste chinaware in the French style. Hard porcelain was introduced in 1775, when pieces with classical figures were in high favor. The Royal Copenhagen Porcelain factory and other factories have produced especially fine tableware and fluted porcelain of the blue Danish pattern. The modern white underglaze porcelain was first made by Arnold Krog in the late 19th cent. and was found to be well adapted to animal and figure sculptures.

copepod: see CRUSTACEAN

Copernican system, first modern European theory of planetary motion that was heliocentric, i.e., that placed the sun motionless at the center of the solar system with all the planets, including the earth, revolving around it. Copernicus developed his theory in the early 16th cent. from a study of ancient astronomical records. He retained the ancient belief that the planets move in perfect circles and therefore, like Ptolemy, he was forced to utilize epicycles to explain deviations from uniform motion (see PTOLEMAIC SYSTEM). Thus, the Copernican system was technically only a slight improvement over the Ptolemaic system. However, making the solar system

heliocentric removed the largest epicycle and explained retrograde motion in a natural way. By liberating astronomy from a geocentric viewpoint, Copernicus paved the way for KEPLER'S LAWS of planetary motion and Newton's embracing theory of universal GRAVITATION, which describes the force that holds the planets in their orbits.

Copernicus, Nicholas (kōpūr'nikās), Pol *Mikotaj Kopernik*, 1473–1543, Polish astronomer. After studying astronomy at the Univ of Krakow, he spent a number of years in Italy studying various subjects, including medicine and canon law. He lectured c 1500 in Rome on mathematics and astronomy, in 1512 he settled in Frauenburg, East Prussia, where he had been nominated canon of the cathedral. There he performed his canonical duties and also practiced medicine. But the work that immortalized him is *De revolutionibus orbium coelestium*, in which he set forth his beliefs concerning the universe, known as the COPERNICAN SYSTEM. That treatise, which was dedicated to Pope Paul III, was probably completed by 1530 but was not published until 1543, when Copernicus was on his deathbed. Modern astronomy was built upon the foundation of the Copernican system. See his complete works, ed by Edward Rosen (Vol. I, 1973), *Three Copernican Treatises*, ed by Edward Rosen (3d ed 1971), studies by S. P. Mizwa (1943, repr 1969), Angus Armitage (1938, repr 1971), and Fred Hoyle (1973), Barbara Bienkowska, ed., *The Scientific World of Copernicus* (1973).

Copi, Irving Marmer (kōp'ē), 1917–, American philosopher, b Duluth, Minn., grad Univ of Mich., 1938, Ph.D. 1948. He was a philosophy professor at the Univ of Illinois (1947–48) and the Univ of Michigan (1948–69) before going to the Univ of Hawaii (1969). Primarily interested in logic, he is the author of *The Theory of Logical Types* (1971), *Introduction to Logic* (4th ed 1972), and *Symbolic Logic* (4th ed 1973).

Copiague (kō'pāg'), uninc. residential town (1970 pop 19,578), Suffolk co., SE N.Y., on the south shore of Long Island.

Copiapó (kōpyapó'), city (1970 pop 51,809), capital of Atacama prov., N central Chile, on the Copiapo River. An industrial city at the southern edge of the Desert of Atacama, Copiapo has industries that ship and process the copper, gold, and silver of the surrounding region. The city was founded in 1540 by Pedro de VALDIVIA, the Spanish conqueror of Chile.

Copland, Aaron (kōp'lənd), 1900–, American composer, b Brooklyn, N.Y. Copland was a pupil of Rubin Goldmark and of Nadia Boulanger, who introduced his work to the United States when she played his *Symphony for Organ and Orchestra* in 1925. Although his earliest works show European influences, the American character of the greater part of his compositions is evident in his use of jazz and of American folk tunes, as in the short piece for chamber orchestra, *John Henry* (1940). Copland's many ballets include *Billy the Kid* (1938), *Rodeo* (1942), and *Appalachian Spring* (1944). He composed music for the films *Of Mice and Men* (1939), *Our Town* (1940), *The Red Pony* (1948), and *The Heiress* (1949). His major orchestral works are *El Salón Mexico* (1936) and the *Third Symphony* (1946). Copland wrote a song cycle, *12 Poems of Emily Dickinson*, and a quartet for piano and strings (both 1950), *Canticle of Freedom* for chorus and orchestra (1955), and a tone poem *Inscape* (1967). With Roger Sessions he founded the Copland-Sessions Concerts (1928–31) and in 1932 organized the American Festivals of Contemporary Music at Yaddo, Saratoga Springs, N.Y. He has lectured extensively and received many awards. His writings include *What to Listen for in Music* (1939, rev ed 1957), *Copland on Music* (1960), and *The New Music 1900–1960* (rev ed 1968). See biographies by Arthur Berger (1953) and Arnold Dobrin (1967), study by J. F. Smith (1955).

Copley, John Singleton (kōp'lē), 1738–1815, American portrait painter, b Boston. Copley is considered the greatest of the American old masters. He studied with his stepfather, Peter Pelham, and undoubtedly frequented the studios of Smibert and Feke. At 20 he was already a successful portrait painter with a mature style remarkable for its brilliance, clarity, and forthright characterization. In 1766 his *Boy with the Squirrel* was exhibited in London and won the admiration of Benjamin West, who urged him to come to England. However, he remained for eight years longer in America and worked in New York City and Philadelphia as well as in Boston. In 1774 he visited Italy and then settled in London, where he spent the remainder of his life, enjoying many honors and the

patronage of a distinguished clientele. In England his style gained in subtlety and polish but lost most of the vigor and individuality of his early work. He continued to paint portraits but enlarged his repertoire to include the enormous historical paintings which constituted the chief basis of his fame abroad. His large historical painting *The Death of Lord Chatham* (Tate Gall., London) gained him admittance to the Royal Academy. His rendering of a contemporary disaster, *Brook Watson and the Shark* (Mus. of Fine Arts, Boston), stands as a unique forerunner of romantic horror painting. However, his reputation today rests largely upon his early American portraits which are treasured not only for their splendid pictorial qualities but also as the most powerful graphic record of their time and place. Portraits such as those of Nicholas Boylston and Mrs. Thomas Boylston (Harvard Univ.), Daniel Hubbard (Art Inst., Chicago), Governor Mifflin and Mrs. Mifflin (Historical Society of Pennsylvania, Philadelphia), and Paul Revere (Mus. of Fine Arts, Boston) are priceless documents in which the life of a whole society seems mirrored. Among his finest later portraits are the curiously distorted image of Samuel Adams (Mus. of Fine Arts, Boston) and the group portrait of the Copley family (privately owned). The Museum of Fine Arts, Boston, has an excellent collection of his works. Copley's son became Baron Lyndhurst in 1827. See catalog with biography by J. D. Prown (1966), biographies by J. T. Flexner (rev ed, 1948) and A. V. Frankenstein (1970).

Copley, John Singleton (1772–1863) see LYNDHURST, JOHN SINGLETON COPLEY, BARON

copolymer: see POLYMER

Coppard, Alfred Edgar, 1878–1957, English author. Almost entirely self-educated, he worked at several clerical positions. His tales, written in a poetic and fanciful vein, include *Adam and Eve and Pinch Me* (1921), *Nixey's Harlequin* (1931), and *Dark-eyed Lady* (1947). He also wrote lyric verse that includes *Hips and Haws* (1922), *Pelagea* (1926), and *Cherry Ripe* (1935). See his collected tales (1948).

Coppee, François (fran'swā' kōpā'), 1842–1908, French poet and dramatist. He won fame with the one-act comedy *Le Passant* (1869, tr 1881), in which Sarah Bernhardt made her first successful appearance. His early verse, as in *Le Reliquaire* (1866), linked him with the PARNASSIANS; his later work, as in *Les Humbles* (1872), is sentimental and tells of the sorrows of the poor. *La Bonne Souffrance* (1898), a religious novel, was written after his return to Catholicism.

Copper, river, c 300 mi (480 km) long, rising in the Wrangell Mts., SE Alaska, and flowing S through the Chugach Mts. to the Gulf of Alaska. The Indians obtained copper from the deposits near the upper river, these deposits attracted the attention of the Russians and later the Americans, but exploration was difficult because of the river's currents and the glaciers near its mouth. The great Kennecott mine (discovered 1898) was finally developed and was reached by the building (1908–11) of the Copper River and Northwestern RR from Cordova, following the river along part of its lower valley. The mine was abandoned in 1938.

copper, metallic chemical element, symbol Cu [Lat *cuprum* = copper], at no 29, at wt 63.54, m.p. 1083°C, b.p. 2595°C, sp. gr. 8.96 at 20°C, valence +1 or +2. Copper is a reddish metal with a face-centered cubic crystalline structure. It is malleable, ductile, and an extremely good conductor of both heat and electricity. It is softer than iron but harder than zinc and can be polished to a bright finish. It is found in group 1b of the PERIODIC TABLE, together with silver and gold. Copper has low chemical reactivity. In moist air it slowly forms a greenish surface film (usually a mixture of carbonate, sulfate, hydroxide, and oxide) called PATINA; this coating protects the metal from further attack. Copper dissolves in hot concentrated hydrochloric or sulfuric acid but is little affected by cold solutions of these acids; it also dissolves in nitric acid. Salt water corrodes copper, forming a chloride. The chief commercial use of copper is based on its electrical conductivity (second only to that of silver), about half the total annual output of copper is employed in the manufacture of electrical apparatus and wire. Copper is also used extensively as roofing, in making copper utensils, and for coins and metalwork. Copper tubing is used in plumbing, and, because of its high heat conductivity, in heat-exchanging devices such as refrigerator and air-conditioner coils. Powdered copper is sometimes used as a pigment in paints. An important use of copper is in alloys such as BRASS, BRONZE, GUN METAL, MONEL METAL, and GERMAN SILVER.

The most important chemical compound of copper is COPPER SULFATE pentahydrate, also called bluestone or blue vitriol. Other compounds include PARIS GREEN, BORDEAUX MIXTURE, a cyanide, a chloride, oxides, and a basic carbonate. Verdigris is basic copper acetate. Compounds of copper are widely used as insecticides and fungicides, as pigments in paints, as mordants in dyeing, and in electroplating. Small amounts of copper are found uncombined, particularly near Lake Superior in Michigan. Copper ores are found in various parts of the world. In the United States (the chief producer of copper) ores are mined in Arizona, Utah, Montana, New Mexico, Nevada, and Michigan. Copper ores are also found in Canada, South America (in Chile and Peru), S. central Africa, the Soviet Union (in the Ural Mts.), and to a limited extent in Europe and the British Isles. The principal ore of copper is CHALCOPYRITE, a sulfide of copper and iron, also called copper pyrite. Other important ores are chalcocite, or copper glance, a shiny lead-gray copper sulfide, bornite, a lustrous reddish-brown sulfide of copper and iron, cuprite, a red cuprous oxide ore, and MALACHITE, a bright green carbonate ore. AZURITE is a blue crystalline basic carbonate of copper found with other copper ores. Chrysocolla is a bluish-green copper silicate ore. Copper metal is prepared commercially in various ways. Copper sulfide ores, usually containing only 1% to 2% copper, are concentrated to 20% to 40% copper by the FLOTATION PROCESS. They are then usually roasted to remove some of the sulfur and other impurities, and then smelted with iron oxide in either a blast furnace or a reverberatory furnace to produce copper matte, a molten solution of copper sulfide mixed with small amounts of iron sulfide. The matte is transferred to a converter, where it is treated by blowing air through it to remove the sulfur (as sulfur dioxide, a gas) and the iron (as a slag of ferrous oxide). The resulting copper is 98% to 99% pure; it is called blister copper because its surface is blistered by escaping gases when it solidifies during casting. Most copper is further purified by ELECTROLYSIS. The blister copper is refined in a furnace and cast into anodes. Thin sheets of pure copper are used as cathodes. A solution of copper sulfate and sulfuric acid is used as the electrolyte. When the anode and cathode are immersed in the electrolyte and an electric current is passed, the anode is dissolved in the electrolyte and pure copper metal is deposited on the cathode. Soluble impurities, usually nickel and arsenic, remain dissolved in the electrolyte. Insoluble impurities, often including silver, gold, and other valuable metals, settle out of the electrolyte; they may be collected and purified. Copper oxide ores are usually treated by a different process, called leaching, in which the copper in the ore is dissolved in a leaching solution (usually dilute sulfuric acid); pure copper is recovered by electrolysis. Alternatively, the solution is treated with iron to precipitate the so-called cement copper, which is impure. Another important source of copper is secondary (scrap) copper, which is produced from discarded copper and copper alloys. Copper is present in minute amounts in the animal body and is essential to normal metabolism. It is a component of hemocyanin, the blue, oxygen-carrying blood pigment of lobsters and other large crustaceans. It is needed in the synthesis of hemoglobin, the red, oxygen-carrying pigment found in the blood of humans, although it is not a component of hemoglobin. Copper and some of its alloys have been known to man since the BRONZE AGE. One of the first metals known to man, free copper was probably mined in the Tigris-Euphrates valley as long ago as the 5th cent. B.C. Cyprus, from which the metal's name ultimately comes, was the primary source of copper in the ancient world.

Copper Age: see BRONZE AGE

copperas: the heptahydrate of FERROUS SULFATE

Copperas Cove (kōp'āras), town (1970 pop 10,818), Coryell co., central Texas. A farm and ranch center, it grew with the establishment of nearby U.S. Fort Hood.

Copperbelt, mining region, N central Zambia, central Africa. A natural extension of the mineral-rich region of SHABA, the Copperbelt is one of the richest sources of copper in the world. Cobalt, selenium, silver, and gold are also produced.

copperhead, poisonous snake, *Ancistrodon conortrix*, of the E. United States. Like its close relative, the water moccasin, the copperhead is a member of the PIT VIPER family, and detects its warm-blooded prey by means of a heat-sensitive organ behind the nostril. The body, which may reach a length of 4 ft

(120 cm), is hazel brown with chestnut-colored crossbands above and pinkish white with dark spots below. The head is a pale copper color. Copperheads inhabit rocky areas with thick underbrush, even in heavily populated regions. They feed chiefly on small mammals, but will also capture large insects, frogs, and other snakes. They are most active in late afternoon and early evening. The young are born alive. Copperheads are not aggressive and usually attempt escape when threatened, but they strike swiftly if startled or attacked. The bite causes severe pain and illness in humans but is seldom fatal. Copperheads are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Crotalidae.

Copperheads, in the American Civil War, a reproachful term for those Northerners sympathetic to the South, mostly Democrats outspoken in their opposition to the Lincoln administration. They were especially strong in Illinois, Indiana, and Ohio, where Clement L. VALLANDIGHAM was their leader. The KNIGHTS OF THE GOLDEN CIRCLE was a Copperhead secret society. The term was often applied indiscriminately to all Democrats who opposed the administration. It afforded an opportunity for impugning the loyalty of those who opposed Lincoln's policies, either military or civil (e.g., the suspension of habeas corpus), and it was not until years after the Civil War that the Democratic party succeeded in living down the association. See Wood Gray, *The Hidden Civil War* (1942), F. L. Clement, *The Copperheads in the Middle West* (1960).

Coppermine, river, 525 mi (845 km) long, rising in Lac de Gras, central Mackenzie dist., Northwest Territories, Canada, and winding northwest to enter the Arctic Ocean at Coronation Gulf. Its many falls gives it great hydroelectric power potential. Coppermine, a trading post, is at its mouth.

copper pyrites. see CHALCOPYRITE

copper sulfate, common name for the blue crystalline heptahydrate of **CUPRIC SULFATE**, in which copper has valence +2. It may also refer to cuprous sulfate (Cu_2SO_4), in which copper has valence +1.

Coppet (kôpâr'), village, Vaud canton, SW Switzerland, on the Lake of Geneva. It is noted for its châteaueau, once the residence of Jacques Necker and his daughter, Mme de Staël.

copra* see COCONUT

Copt (kôpt), member of the native Christian minority (5%-10%) of Egypt. Copts are not ethnically distinct; they are a cultural remnant, i.e., the Christians who have not been converted to Islam in the 14 centuries since the Muslim invasion. The Coptic language, now extinct, was the form of the ancient Egyptian language spoken in early Christian times, by the 12th cent. it was superseded by Arabic. Most Copts belong to the Coptic Church, an autonomous Christian sect that officially adheres to MONOPHYSITISM, which was declared (451) a heresy by the Council of Chalcedon. The church is in communion with the Jacobite Church (also Monophysite), but a traditionally close relationship to the Church of Ethiopia was dissolved in 1961 when it declared itself independent of the Coptic patriarch. In rites and customs the Coptic Church resembles other Oriental churches, however, Copts circumcise their infants before baptism and observe certain Mosaic dietary laws. Coptic, Greek, and Arabic languages are all used ceremonially. The chief bishop, the patriarch of Alexandria, is in direct succession to the 5th-century patriarchs who embraced Monophysitism. Among the Copts a small minority are in communion with the pope, these "Catholic Copts" have their own organization and churches but share the rites and practices of the Coptic Church. This community began to develop in the 18th cent. Protestant missions have had some success among the Copts. Besides Copts there are Orthodox communities in Egypt, mainly Greek and Syrian, the Orthodox patriarch of Alexandria traces his succession to the Catholic patriarchs of the 5th cent. There are also many Catholic Syrians, mainly Melchites and Maronites. See Donald Attwater, *The Christian Churches of the East* (2 vol., 1947-48), Edward Wakin, *A Lonely Minority: The Story of Egypt's Copts* (1963), Murâd Kâmil, *Coptic Egypt* (1968), O. F. A. Meindarus, *Christian Egypt, Faith and Life* (1970).

Coptic art, Christian art in the upper Nile valley of Egypt. Reaching its mature phase in the late 5th and 6th cent., the development of Coptic art was interrupted by the Arab conquest of Egypt between 640 and 642. Its subsequent course was marked by the influence of Islamic art and a repetition of earlier forms. In contrast with the aristocratic taste prevailing in cosmopolitan Alexandria, which was in close

touch with the leading artistic centers of the Roman Empire, older and deeply ingrained traditions remained in force in the upper Nile valley, where an intensely religious culture drew its following chiefly from the lower classes. Coptic art is characterized by a high degree of stylization verging on abstraction. Forms are flattened out, and individual motifs acquire bold simplicity and decorative character. Subject matter represents both Christian and Roman sources. Remains of wall paintings reveal scenes from the Old and New Testaments and images of the Mother and Child. Some of the archaeological sites are El-Bagawat, Oxyrhynchus, Sakkara, Bawit, and Antinoe. Representative examples of Coptic art are in sculpture, textiles, ivory, and illumination. Coptic architecture, as shown in the 5th-century White and Red monasteries near Sohag, showed traces of local Egyptian traditions. See K. Wessel, *Coptic Art: The Early Christian Art of Egypt* (1965).

Coptos (kôp'tas, -tôs) or **Coptus** (kôp'tas), ancient city of Egypt, on the right bank of the Nile, c. 27 mi (43 km) N of modern Luxor. Remains of the Temple of Min, patron god of Coptos, have been found there as well as relics from the time of Ramses II and Thutmose III. The town was of importance in Hellenistic times, when it was the terminus of a caravan route to Berenice on the Red Sea. It was built up by Augustus, fell to the Blemmyes in the 3d cent. A.D., and was almost destroyed by Diocletian in A.D. 292. The present-day village of Qift is on the site.

copying processes* see PRINTING, PHOTOCOPYING

copyright, right granted by statute to the author or originator of certain literary, artistic, and musical productions whereby for a limited period of time he controls the use of the product. He may reproduce the work himself or license another to do so. He receives royalties (payments) on each performance of his work or each copy that is sold. Except for limited measures taken in Roman times, protection of rights in literary property did not appear necessary in Europe before the invention of printing from movable type in the 15th cent. The sovereign asserted his control over printing by issuing patents or privileges to individuals or by organizing publishers' guilds with monopoly rights. Through such devices the state was able to censor heresy and sedition, while at the same time fostering literature. The guilds kept order among their members and were supposed to prevent pirating. In England this function was assigned to the Stationers' Company (chartered 1556), comprising a hundred or so printers and booksellers. The only protection that the common law extended to the author was against publication of his work without his permission, once he allowed publication, the work passed completely out of his control. The first English copyright act (1710), while not abolishing the common-law right, allowed the author to copyright his work for 14 years (with a like period of renewal) and required deposition of copies and a notice that the work was copyrighted. That law was the model for the earliest American copyright statute, passed in 1790 pursuant to Article 1, Section 8 of the U.S. Constitution. The American statute in force today was passed in 1909. It provides for a term of 28 years and a single renewal of the term. Material for copyright must be deposited with the Library of Congress. Literary matter, periodicals, maps, photographs, works of art, textile and other designs, sound recordings, musical compositions, and photoplays may be copyrighted. In the United States prior to 1891, when a special foreign copyright law was passed, it was almost impossible for books by foreign authors to be copyrighted. The most popular British books were published in cheap unauthorized editions, and the writers often received no royalties. After 1891 material in foreign languages was easily copyrighted in the United States, material in English, however, could not be copyrighted if it was imported, unless, in addition, type was set and material printed and bound in the United States. Most of the major countries of the world, with the exception of the United States, however, adhered to the Bern Convention, effective in 1887 and since modified. It provides that literary material copyrighted in any signatory country automatically enjoys copyright in all the signatory countries. The Universal Copyright Convention (UCC), which had as one main purpose bringing the United States into a general system of international copyright, was signed at Geneva on Sept. 6, 1952. It was accepted by the United States in 1954 and came into effect Sept. 16, 1955. The U.S. copyright law was modified to conform to the convention, notably by elimination of procedural steps for the establishment of U.S. copyright in works published in other signatory countries and of the requirement that

works in the English language by foreign authors must be manufactured in the United States to obtain U.S. copyright protection. Other countries accept the U.S. principle of formal notice of copyright. The United Nations Educational, Scientific, and Cultural Organization played a leading part in the negotiations for the UCC. Most of the Western nations and many of the Asian nations subscribe to it. The Soviet Union signed in 1973. See Margaret Nicholson, *A Manual of Copyright Practice for Writers, Publishers, and Agents* (2d ed. 1956, repr. 1970), Richard Wincor, *How to Secure Copyright* (rev. ed. 1957), A. J. Clark, *The Movement for International Copyright in 19th Century America* (1960), L. R. Patterson, *Copyright in Historical Perspective* (1968), H. F. Pipel and M. D. Goldberg, *Copyright Guide* (4th ed. 1969).

Coquelin, Benoît Constant (bânwa' kôNstaN' kôk-lân'), 1841-1909, French actor, known as Coquelin aîné [the elder]. He made his debut at the Comédie française in 1860 and achieved fame in classic comic roles, such as the valets in Molière's plays and Beaumarchais's *Figaro*. He made an extensive tour of Europe and America in 1886. In 1897 he created his greatest characterization, the title role in Rostand's *Cyrano de Bergerac*, at the Théâtre de la Porte-Saint-Martin, which he also managed. In 1900 he toured the United States with Sarah Bernhardt and returned to Paris to play opposite her in Rostand's *L'Aiglon*. Highly critical and analytical toward his art, and believing in simulated rather than real emotions, he wrote *L'Art et le comédien* (1880) and *Les Comédiens, par un comédien* (1882), his approach led to an interesting debate with Sir Henry Irving on techniques of acting. His brother, Ernest Alexandre Honore Coquelin, 1848-1909, known as Coquelin cadet [the younger], acted at the Comédie française after 1868. At his best in secondary comic roles, he was also popular for his monologues and several amusing books written under the pseudonym Pirouette.

Coquerel, Athanase Laurent Charles (atanaz' lôraN' shârî kôkrêl'), 1795-1868, French Protestant clergyman, noted for his eloquence as a preacher. From 1832 he was pastor of the Reformed Church in Paris. He founded and edited liberal periodicals. Among his publications are *Biographie sacrée* (1825-26), *L'Orthodoxie moderne* (1842), and *Christologie* (1858). His son Athanase Josue Coquerel, 1820-75, was also a well-known Protestant minister in Paris. From 1849 to 1870 he edited the *Lien*. In 1852 he helped to found the *Nouvelle Revue de théologie*. Among his works are *Jean Calas et sa famille* (1857) and *Histoire de l'Eglise réformée de Paris* (1860).

Coques or Cocx, Gonzales (gônza'lê's kôks), 1614-84, Flemish portrait painter, active in Antwerp and England. He excelled in painting diminutive portraits and family groups of the aristocracy with meticulously executed backgrounds. The elegance of his paintings won him the title "the little Van Dyck." Coques is represented in the galleries of Berlin, Dresden, Paris, London, Vienna, and Philadelphia.

Coquilhatville, Zaire. see MBANDAKA

coquilla nut (kôkê'yâ, kôkêl'yâ), [Span. = little coconut], fruit of a Brazilian PALM (*Attalea funifera*), closely related to the coconut palm. Its fruit, 3 to 4 in (7.6-10.2 cm) long, is very hard, of a richly streaked brown, and capable of taking a fine polish, it is used in cabinetwork and for such turned articles as bellpulls, umbrella handles, and walking-stick knobs. A stiff, wiry, bright chocolate-colored leaf fiber, called piassava or piassaba, obtained from this and similar palms, is exported. It is used in making brooms and rope. The nut is also a source of palm oil. Coquilla nuts are classified in the division MAGNOLIOPHYTA, class Liliatae, order Arecales, family Palmae.

Coquimbo (kôkêm'bô), city (1970 pop. 55,360), N central Chile. On a beautiful sheltered bay of the Pacific, it is the port for LA SERENA. Exports are chiefly agricultural produce and minerals. In 1922, Coquimbo was severely damaged by a tidal wave following an earthquake.

coral, small, sedentary, marine animal, related to the sea anemone, but characterized by a skeleton of horny or calcareous material. The skeleton itself is also called coral. Although most corals form colonies by budding, there are some solitary corals, in both types the individual animals, called polyps, resemble the sea anemone in form. In the large group known as stony corals, or true corals (*Madreporaria*), each polyp secretes a cup-shaped skeleton, the theca, around itself. Some solitary corals of that group may reach a diameter of 10 in (25 cm), in the

The key to pronunciation appears on page xi

colonial forms the individual polyps are usually under $\frac{1}{8}$ in (3 mm) long, but the colonies may be enormous. The body of each polyp is saclike, consisting of a wall of jellylike material surrounding a digestive cavity, with a single opening, the mouth, at the unattached end. The mouth is surrounded by tentacles used to capture small prey, and is invaginated to form a pharynx leading into the body cavity. Thin sheets of tissue (mesenteries) extend radially from the wall to the pharynx, dividing the cavity. A second set of radial divisions is created by folds (septa) of the outer skeleton and body wall, which extend upward from the floor of the body cavity. Reproduction occurs both sexually and by budding. Sexual reproduction is by means of eggs and sperm that are produced in the mesenteries and shed into the water. Fertilization results in a free-swimming larva, which attaches to a surface and secretes a skeleton, becoming (in colonial forms) the parent of a new colony. As new polyps are produced by budding they remain attached to each other by thin sheets of living tissue as well as by newly secreted skeletal material. The great variety in the form of various colonial corals, which may be treelike and branching, or rounded and compact, depends chiefly on the method of budding of the particular species. In the brain corals, for example, each theca merges with the one next to it on either side, forming long rows of polyps separated by deep channels. In some of the branching corals the polyps occupy small, discrete pits on the surface of the skeleton. As a colonial coral produces more polyps the lower members die, and new layers are built up on the old skeleton, forming a large mass. In tropical and subtropical regions, these massive corals, along with other plants and animals, may form a CORAL REEF. Most of the reef-forming corals belong to the stony coral group. The soft corals (Alcyonaria) are a group of soft, often feathery forms, with skeletons composed of calcareous or horny particles imbedded in the body wall. Each polyp of a soft coral has eight tentacles. Among the well-known soft corals are the SEA PEN, SEA PANSY, whip coral, and organpipe coral. The precious red coral (*Corallium*) of the Mediterranean Sea, used for jewelry, also belongs to that group. The spicules of its skeleton are fused together. Although corals grow in both warm and temperate climates, they are most abundant in warm, shallow water, over 200 coral species are found in the Great Barrier Reef of Australia. In many shallow-water species the polyps contain unicellular plants, which may provide the high oxygen concentration required by such corals. Stony and soft corals are classified in the phylum CNIDARIA, class Anthozoa.

coral bells see SAXIFRAGE

Coral Gables, city (1970 pop. 42,494), Dade co., SE Fla., on Biscayne Bay, inc. 1925. Founded at the height of the Florida land boom, Coral Gables is mainly residential and is a splendid example of a planned city. Electronic equipment, processed meat, and furniture are among its products. Coral Gables is the headquarters for various Inter-American business organizations. The Univ. of Miami is in the city.

coralline algae see RHODOPHYTA

coral reefs, limestone formations produced by living organisms, found in shallow, tropical marine waters. In most reefs, the predominant organisms are stony CORALS, colonial cnidarians that secrete an exoskeleton of calcium carbonate (limestone). The accumulation of skeletal material, broken and piled up by wave action, produces a massive calcareous formation that supports the living corals and a great variety of other animal and plant life. Although corals are found both in temperate and tropical waters, reefs are formed only in a zone extending at most from 30°N to 30°S of the equator, the reef-forming corals do not grow at depths of over 100 ft (30 m) or where the water temperature falls below 72°F (22°C). Corals are not the only, and in some cases not even the major, reef-forming organisms. Calcium carbonate is also deposited by coralline algae, the protozoan FORAMINIFERANS, some mollusks, echinoderms, and tube-building annelid worms. However, any reef formed by a biological community is usually called a coral reef. Geologically, coral reefs are classified into three main types. Fringing reefs are coral platforms that are more or less continuous with the shore and exposed at low tide. Barrier reefs are separated from the shore by a wide, deep lagoon or surround a lagoon that has a central island. An atoll is a reef surrounding a lagoon that has no central island, with passages through the reef to the sea. It is generally believed that fringing reefs formed as a result of upward and outward growth of corals

that became established on rocks near shore, there is disagreement about the nature of barrier reef and atoll formation. Charles Darwin postulated a progression from fringing reef to barrier reef to atoll, as a result of a slow, steady sinking of the sea floor that creates a lagoon and a simultaneous upward and outward growth of coral. Where entire volcanic islands sink, only the reef remains above water, forming an atoll. Not all scientists accept Darwin's proposal, but most current theories involve subsidence of the sea floor. Changes of the ocean level may also be involved. Sediments accumulate on the lagoon side of atolls and support vegetation, in time the entire lagoon may fill, creating an island. Many such atolls and islands, common in the Pacific and Indian oceans, are inhabited. The Great Barrier Reef of NE Australia is the largest known complex of coral reefs. It is 10 to 90 mi (16-145 km) wide and about 1250 mi (2010 km) long, and is separated from the shore by a lagoon 10 to 150 mi (16-240 km) wide. See Robert Silverberg, *The World of Coral* (1965).

coral-root see ORCHID

Coral Sea, southwest arm of the Pacific Ocean, between Australia, New Guinea, and the New Hebrides. The Great Barrier Reef lies along its western edge. During World War II it was the scene of a major U.S. victory against the Japanese in 1942, the battle, fought by aircraft near the Louisiade Archipelago, checked the southward expansion of the Japanese.

coral snake, name for poisonous New World snakes of the same family as the Old World COBRAS. About 30 species inhabit Mexico, Central America, and N. South America, two are found in the United States. The Eastern coral snake (*Micrurus fulvius*), or harlequin snake, is found in the SE United States and N. Mexico. It is a burrowing snake with a small, blunt head and a cylindrical body, averaging 2½ ft (75 cm) in length. The body is ringed with bands of black, red, and yellow, the tail has yellow and black rings only. The Sonoran, or Western, coral snake (*Micruroides euryxanthus*) is a rather rare species found in the SW United States and NW Mexico. It is about 18 in. (45 cm) long and has much broader bands of yellow than those of the Eastern species. Coral snakes can be distinguished from a number of similarly colored harmless snakes by the fact that they are the only ones with red bands touching yellow ones. The venom of coral snakes, like that of cobras, acts on the nervous system and causes paralysis, the mortality rate among humans who are bitten is high. However, coral snakes are infrequently encountered because of their burrowing habits, and they seldom bite unless handled. They feed on other snakes and on lizards. Coral snakes are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Elapidae.

Coram, Thomas (kôr'am), 1668?-1751, English philanthropist and colonizer. He lived for some years in Massachusetts, working as a shipbuilder. On his return to England he became (1732) a trustee of James Oglethorpe's Georgia colony and sponsored (1735) a colony in Nova Scotia for unemployed artisans. He established the London Foundling Hospital (1739), a pioneer institution of its kind. See biography by Herbert Compston (1918).

Corbett, James John, 1866-1933, American boxer, b. San Francisco. "Gentleman Jim" Corbett won (1892) the heavyweight boxing championship from John L. SULLIVAN at New Orleans and lost (1897) the title to Robert L. FITZSIMMONS at Carson City, Nev. He failed (1900, 1903) to regain the title in fights with James J. Jeffries. Corbett also appeared on the stage and in films and wrote *The Roar of the Crowd* (1925).

Corbiere, Tristan (trêstān' kôrbîyēr'), 1845-75, French poet, born Édouard Joachim Corbiere. He spent most of his life on the coast of Brittany, living a Bohemian existence and suffering chronic illness. His passion for the sea is expressed in his early poems *Gens de mer* [men of the sea], which were collected in *Les Amours jaunes* (1873, tr. 1954). Corbiere's style combines vernacular elements with complex, intimate emotion and constantly reflects his internal pain. Verlaine brought his work to the attention of the literary world, and, in the 20th cent., the surrealist writers claimed him as an ancestor.

Corbin, Margaret, 1751-1800, American Revolutionary heroine, b. Franklin co., Pa. Upon the death of her husband in the attack on Fort Washington (Nov. 16, 1776), she commanded his cannon until she was seriously wounded. She was the first woman to be pensioned (1779) by the government. In 1916 her remains were moved from Highland

Falls, N.Y., to West Point, where a monument was erected in her honor.

corbina (kôrbē'nā) see CROAKER

Corby, urban district (1971 pop. 47,716), Northamptonshire, central England. Situated over one of the world's largest ironstone fields, Corby has grown rapidly since the 1930s, when new techniques of steel production were developed. The manufacture of steel tubing is the chief industry.

Corcoran, William Wilson (kôr'karən), 1798-1888, American financier, philanthropist, and art collector, b. Georgetown, D.C. After becoming a successful banker, he retired in 1854 and devoted himself to his philanthropic activities, which included gifts to many educational and religious institutions, as well as the founding of the Louise Home for Women in Washington. His chief gift was the Corcoran Gallery of Art, in Washington, which had as its nucleus Corcoran's art collection. The present marble building, designed by Ernest Flagg, was opened in 1897. The gallery has collections of paintings, sculpture, and ceramics, as well as an art school.

Corcoran Gallery of Art: see under CORCORAN, WILLIAM WILSON

Corcyra: see KÉRKIRA, Greece

cordage, collective name for rope and other flexible lines. It is used for such purposes as wrapping, hauling, lifting, and power transmission. Early man used strips of hide, animal hair, and plant materials. Hemp and flax were formerly standard in Europe and America but were largely replaced in the 19th cent. by hard fibers, especially Manila hemp and sisal. In the 20th cent. the natural fibers have been replaced in many applications by synthetic fibers such as nylon and polyester. The fibers are straightened, usually by combing, then spun into yarn. Twine, which is sometimes called cord, is formed by wrapping two or more yarns together. By twisting together a number of yarns, a strand is formed. By twisting together three or more strands, a rope is produced. A cable-laid rope is formed from three or more ropes. In general a synthetic fiber rope lasts much longer and is much stronger than a natural fiber rope. Steel wire, often with a fiber core, is also used for rope.

Corday, Charlotte (Marie Anne Charlotte Corday d'Armont) (kôrdā', marē' an sharlôt', dârmôn'), 1768-93, assassin of Jean Paul MARAT. Although of aristocratic background, she sympathized with the GIRONDISTS in the French Revolution and felt that Marat, in his persecution of the Girondists, was acting as the evil genius of France. She resolved to emulate the action of Brutus and destroy the "tyrant." Leaving her native Normandy for Paris, she gained an audience with Marat by promising to betray the Girondists of Caen and stabbed him (July 13, 1793) in his bath. She was guillotined. See Austin Dobson, *Four Frenchwomen* (1923), Joseph Shearman (pseud. of G. M. V. C. Long), *The Angel of the Assassination* (1935).

Cordele (kôrdēl'), city (1970 pop. 10,733), seat of Crisp co., S. central Ga., on a branch of the Flint River, founded and inc. 1888. It is a shipping, commercial, and processing center located in a timber and farm area. Watermelons, cotton, peanuts, corn, and cantaloupes are grown there.

Cordeliers (kôrdēlyä'), political club of the French Revolution. Founded (1790) as the Society of the Friends of the Rights of Man and of the Citizen, it was called after its original meeting place, the suppressed monastery of the Cordeliers (Franciscan Recollects). In 1792-93 the club was instrumental in the destruction of the GIRONDISTS, or moderates. Its early leaders, such as Georges DANTON, having withdrawn, the club drifted to the extreme left under the influence of Jean Paul MARAT and Jacques René HÉBERT. Controlling the Paris commune, the extremists, or Hebertists, were a threat to the power of Maximilien ROBESPIERRE, who had them executed during the REIGN OF TERROR. The club dissolved after Hebert was executed (March, 1794).

cordial see LIQUEUR

Cordier, Andrew Wellington, 1901-, American educator and public official, b. Canton, Ohio. He studied at Manchester College in Indiana, where he later taught (1923-44). He also studied at the Univ. of Chicago and at the Graduate Institute of International Studies in Geneva. After working briefly for the U.S. Dept. of State (1944-46) he began a long association with the United Nations, where he was until 1962 executive assistant to the UN secretaries general. He was a chief negotiator for the United Nations in the Congo in 1960. In 1962 he became dean of the School of International Affairs (SIA) at Columbia. When Grayson Kirk resigned, he served

as acting president (1968-69) and then as president (1969-70) of Columbia, subsequently returning to his post at SIA until 1972

Cordilleras (kōrdil'əraz, Span kōrdēyā'ras) [Span, originally=little string], general name for the entire chain of mountain systems of W North America, extending from N Alaska to Nicaragua. The Cordilleras include the Rocky Mts, the ranges of the Great Basin, the Sierra Nevada, the Coast Ranges, and the Sierra Madre. The name Cordilleras was first applied to the similar systems of W South America, where the mountains stretching from Panama to Cape Horn are known locally as the Cordillera de los Andes (Andes Mts). Some geographers use the term *cordillera* for any extensive group of mountain systems

cordite: see POWDER

Cordoba, Francisco Fernández de: see FERNÁNDEZ DE CÓRDOBA, FRANCISCO

Córdoba, Gonzalo Fernández de: see FERNÁNDEZ DE CÓRDOBA, GONZALO

Córdoba (kōr'dōvā), city (1970 pop 798,663), capital of Córdoba prov, central Argentina, on the Rio Primero. It is the third largest city of Argentina and a cultural and commercial center. Near the city on the Primero is one of the most important dams in South America. Irrigation has transformed the surrounding countryside, formerly devoted to cattle ranches, into orchards, grain fields, and vineyards. Córdoba exports wheat, cattle, lumber, and minerals, and there are some small industries. The city is also a popular tourist and health resort. Córdoba was founded in 1573 and prospered during colonial times as a link on the commercial route between Buenos Aires and Chile. The advent of the railroad in the 19th cent increased prosperity. Many buildings in the city date from colonial times. Most notable are the cathedral and the former city hall (now a police headquarters). The university (founded 1613) made Córdoba an early intellectual center of South America. The city also has an observatory and several museums

Córdoba, city (1970 pop 60,944), Veracruz state, E central Mexico. It is the commercial and processing center of a fertile coffee, sugarcane, and tropical fruit region. Sugar milling is the chief industry. The city is also a popular tourist spot. Córdoba was founded in 1617. The Spanish viceroy O'Donoju and the Mexican revolutionary Agustín de Iturbide signed a treaty there in 1821 that established Mexico's independence

Cordoba or Cordova, city (1970 pop 235,632), capital of Córdoba prov, S Spain, in Andalusia, on the Guadalquivir River. Modern industries in the city include brewing, distilling, textile manufacturing, and metallurgy. Of Iberian origin, Córdoba flourished under the Romans, then passed to the Visigoths (572) and the Moors (711). Under the Umayyad dynasty it became the seat (756-1031) of an independent emirate, later called caliphate, which included most of Muslim Spain. The city was then one of the greatest and wealthiest in Europe, renowned as a center of Muslim and Jewish culture and admired for its architectural glories—notably, the great mosque, begun in the 8th cent, which is one of the finest of all Muslim monuments, and for its gold, silver, silk, and leather work. The city reached its zenith under Abd ar-Rahman III but declined after the fall of the Umayyads and became subject to Seville in 1078. Ferdinand III of Castile conquered it in 1236, in 1238 the great mosque became a cathedral. Córdoba never recovered its former splendor, but remained famous for its work in gold, silver, and leather. It was sacked by the French in 1808 and sided with Franco early (1936) in the civil war. The Senecas, Lucan, Averroës, and Maimonides were born in Córdoba. There is a university in the city

Cordova, Spain: see CÓRDOBA

corduroy, a cut filling-pile fabric with lengthwise ridges, or wales, that may vary from fine (pinwale) to wide. Extra filling yarns float over a number of warp yarns that form either a plain-weave or twill-weave ground. After the fabric is woven the floating yarns are cut, and the pile is brushed and singed to produce a clear cord effect. Originally a cotton fabric, it may also be made of man-made fibers such as rayon, polyester, or acrylic. Among its uses are in the manufacture of trousers, coats, and slip covers

Core (kō'rē), variant of KORAH

Corelli, Arcangelo (ärkän'jälō kōrē'l'jē), 1653-1713, Italian composer and violinist. Famed for his virtuosity and his elegant style of composition, he spent most of his life in Rome, where he was court violinist to Cardinal Ottoboni. His violin technique was perpetuated by his many students and in his sonatas

for violin with harpsichord, among which is the well-known set of variations on the air *La Follia*. He also helped to establish the typical form of the concerto grosso (see CONCERTO). See Marc Pincherle, *Corelli: His Life, His Work* (tr., 1956)

Corelli, Franco (frāng'kō), 1923?- , Italian tenor. He made his debut at Spoleto in 1952 as Don Jose in Bizet's *Carmen*. In 1961 he made his debut with the Metropolitan Opera, singing Manrico in Verdi's *Il Trovatore*. Since then he has been a leading tenor with the Metropolitan, extraordinarily popular, and famed for the great volume of his voice. He is particularly noted for his performances as Calaf in Puccini's *Turandot* and as Cavaradossi in *Tosca*

Corelli, Marie (kōrē'l'ē), pseud of Mary Mackay, 1855-1924, English novelist. Her popular, highly moralistic books, written in flamboyant, pretentious prose, include *A Romance of Two Worlds* (1886), *Thelma* (1887), *Barabbas* (1893), and *The Sorrows of Satan* (1895). She was Queen Victoria's favorite novelist. See biographies by Eileen Bigland (1953) and W S Scott (1955)

coreopsis (kōrēōp'sis), or **tickseed**, names for species of *Coreopsis*, a chiefly North American genus of the family Compositae (COMPOSITE family). They are easily cultivated annuals or perennials with daisylike heads of flowers in various colors—commonly yellow or variegated. Garden kinds are sometimes called calliopsis. *Coreopsis* is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Compositae

Corfu, Greece: see KÉRKIRA

corgi: see CARDIGAN WELSH CORGI, PEMBROKE WELSH CORGI

Cori, Carl Ferdinand (kōr'ē), 1896- , and his first wife, **Gerty Theresa (Radnitz) Cori**, 1896-1957, American biochemists. They were both born in Czechoslovakia and received M.D. degrees (1920) from German Univ of Prague. In 1920 they were married, and in 1922 they came to the United States, where they later (1928) were naturalized. Carl Cori was professor of pharmacology and biochemistry (1931-66) at the school of medicine at Washington Univ., St. Louis, and Gerty Cori was professor of biological chemistry at the same institution (from 1947), with which she also had been associated from 1931. For their contributions to biochemistry, especially their research on carbohydrate metabolism and enzymes, the Coris shared with B. A. Housay the 1947 Nobel Prize in Physiology and Medicine. Since 1966, Carl Cori has served as visiting lecturer at Massachusetts General Hospital, Boston

coriander (kōr'ēän'dər), strong-smelling Old World annual herb (*Coriandrum sativum*) of the family Umbelliferae (CARROT family), cultivated for its fruits. Dried coriander seed contains an aromatic oil used as a flavoring, as a medicine, and in liqueurs. The seed itself is used as a spice similarly to that of the related caraway and cumin. Coriander is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae

Corinna (kōrin'a), fl. c 500? B.C., Greek poet of Tanagra. The 4th-century spelling of her text has caused some scholars to identify her as Hellenistic. Her verse, fragments of which remain, dealt with mythological themes and was written in Boeotian dialect

Corinth, Louis (lō'vēs kō'rīnt), 1858-1925, German painter and graphic artist. He studied in Paris and Munich, joined the Berlin secession group, and later succeeded Max Liebermann as president. His early work was naturalistic in approach. Corinth was antagonistic toward the expressionist movement, although after a stroke in 1911 his style loosened and took on many expressionistic qualities. His colors became more vibrant, and he created portraits and landscapes of extraordinary vitality and power. A self-portrait is in the Museum of Modern Art, New York City. See catalog by the New York Gallery of Modern Art (1964)

Corinth (kōr'īnth) or **Kórinthos** (kō'rīnthōs), city (1971 pop 20,733), capital of Corinth prefecture, S Greece, in the NE Peloponnesus, on the Gulf of Corinth. It is a port and major transportation center trading in olives, tobacco, raisins, and wine. Founded in 1858 after the destruction of Old Corinth by an earthquake, it was rebuilt after another earthquake in 1928. It formerly was known as New Corinth. Old Corinth, just southwest of modern Corinth, is now a village. Strategically situated on the Isthmus of Corinth and protected by the fortifications on the ACROCORINTHUS, Corinth was one of the largest, wealthiest, most powerful, and oldest cities of ancient Greece. Dating from Homeric times, it was conquered by the Dorians. In the 7th

and 6th cent. B.C., under the tyrants Cypselus, his son Periander, and their successors, it became a flourishing maritime power. Syracuse, Kerkira, Potidaea, and Apollonia were among its colonies. The natural rival of Athens, Corinth was traditionally allied with Sparta. Athenian assistance to the rebellious Corinthian colonies was a direct cause of the PELOPONNESIAN WAR (431-404 B.C.). During the Corinthian War (395-387 B.C.), however, Corinth joined with Athens against the tyrannical rule of Sparta. After the battle of Chaeronea (338 B.C.) Corinth was garrisoned by Macedonian troops. It became (224 B.C.) a leading member of the ACHAean LEAGUE and in 146 B.C. was destroyed by the victorious Romans. Julius Caesar restored it (46 B.C.) and also reestablished the ISTHMIAN GAMES. Corinth was again laid waste by the invading Goths (A.D. 395) and by an earthquake in 521. Early in the 13th cent., Corinth was conquered by Geoffroi I de Villehardouin as a sequel to the Fourth Crusade. It was taken by the Ottoman Turks in 1458, and in 1687 was seized by Venice, which lost it to the Turks in 1715. In 1822 it was captured by Greek insurgents. Ancient ruins at Old Corinth include the market place, fountains, the temple of Apollo, and a Roman amphitheater. Paul preached here, and wrote two epistles to the infant Corinthian church

Corinth, city (1970 pop 11,581), seat of Alcorn co., extreme NE Miss., near the Tenn. line, in a livestock and farm area, founded c 1855. Manufactures include telephone equipment, textiles, clothing, and dairy products. During the Civil War, Corinth was a strategic railroad center, abandoned to Gen. H. W. Halleck's Union army in May, 1862, after the battle of Shiloh. General Rosecrans repulsed the Confederates under generals Earl Van Doren and Sterling Price in heavy fighting there, Oct. 3-4, 1862. Corinth National Cemetery (est. 1866) has 6,000 graves

Corinth, Gulf of, inlet of the Ionian Sea, c 80 mi (130 km) long and from 3 to 20 mi (4.8-32 km) wide, indenting central Greece and separating the Peloponnesus from the Greek mainland. It is connected with the Saronic Gulf by the 4-mi (6.4-km) Corinth Canal (which cuts across the Isthmus of Corinth at sea level), and with the Gulf of Patrai by the Rion Strait. The city of Corinth lies on the gulf's south-eastern shore

Corinth, Isthmus of, c 20 mi (32 km) long and 4-8 mi (6.4-12.9 km) wide, connecting central Greece (Attica and Boeotia) with the Peloponnesus, between the Gulf of Corinth and the Saronic Gulf. It is crossed by the Corinth Canal, built between 1881 and 1893, which connects the Aegean and the Adriatic seas. Parallel to the canal are ruins of the ancient Isthmian Wall, which was restored (3rd-6th cent. A.D.) by Byzantine emperors to defend the Peloponnesus. Near the eastern end of the wall are ruins of the sanctuary of Poseidon where the ISTHMIAN GAMES were played

Corinthian order, most ornate of the classic orders of architecture. It was also the latest, not arriving at full development until the middle of the 4th cent. B.C. The oldest known example, however, is found in the temple of Apollo at Bassae (c 420 B.C.). The Greeks made little use of the order, the chief example is the circular structure at Athens known as the CHORAGIC MONUMENT of Lysicrates (335 B.C.). The temple of Zeus at Athens (started in the 2d cent. B.C. and completed by Emperor Hadrian in the 2d cent. A.D.) was perhaps the most notable of the Corinthian temples. The Greek Corinthian, aside from its distinctive capital, is similar to the Ionic but the column is somewhat more slender. The capital, which may have been especially devised for circular structures, is of uncertain origin. Callimachus is the legendary originator of the design. The delicate foliated details make plausible an original in metalwork. The Romans used the Corinthian order in numerous monumental works of imperial architecture. They gave it a special base, made carved additions to the cornice, and created numerous capital variations, utilizing florid leafage and sometimes human and animal figures. The prevailing form of Roman Corinthian is seen in the Pantheon and the Maison Carree, and it was embodied in the order as later systematized by the Italian writers of the Renaissance (e.g., Vignola). The capital joined acanthus leaves and volutes, scroll-shaped forms, in an intricate combination and Renaissance sculptors and metalworkers, especially in Italy, France, and Spain, found in its complexity a medium for their full virtuosity. The volutes either became mere light scrolls or were replaced by birds, rams' heads, or grotesque figures. The composite order, so named by the 16th-century codifiers, is actually only a vari-

ation of the Corinthian, devised by the Romans as early as the 1st cent. A.D. by forming a capital in which were combined both Corinthian foliage and the volutes and echinus, or rounded molding, of the four-cornered type of Ionic. For the other Greek orders see DORIC ORDER and IONIC ORDER.

Corinthians (kôrĭn'thēanz), two epistles of the New Testament, the seventh and eighth books in the usual order. They were written to the church at Corinth by St. PAUL. First Corinthians, written probably at Ephesus early in A.D. 55, is one of the longest and most important epistles. The first main part (1:10-4:21) attacks factionalism at Corinth, giving as its remedy the mystery of the Cross (1:18-3:4) and showing the true nature of Christian ministry (3:5-4:5). St. Paul then condemns several practices—incest (5), litigation among Christians (6:1-11), and fornication (6:12-20). He answers questions on marriage and celibacy (7), on the scandal involved in eating meat previously offered in pagan sacrifices (8, 10), and on the veiling of women in church (11:3-16). The rest of the epistle contains five famous passages—the institution of the Eucharist (11:20-34), the doctrine of the mystical body of Christ, i.e., Christian believers conceived as a unity (12), an eloquent panegyric on Christian love (13), the functions of prophecy among Christians (14), and a splendid chapter on Christ's resurrection (15). The epistle closes with a discussion of practical plans (16). Second Corinthians is shorter, it was written perhaps within a year of the other, probably from Macedonia. Its burden is Paul's apostleship, his authority, and his motives. After particulars of his relations with the Corinthians (1:15-2:17), there follow statements about the Christian ministry (3:4-6) and about Paul's motives rooted in personal union with Jesus (4:7-6:10), these lead to an exhortation (6:11-7:16). A digression (8-9) follows about collection of alms for poor Christians of Jerusalem. The last portion of the epistle contains a magnificent defense of the apostle's mission, citing his authority (10) and recounting his behavior (11-12:13). The announcement of an impending visit of the apostle to Corinth ends the book. Many critics consider the epistle (on internal evidence) to represent the accidental combination of two letters, the last four chapters being then separate from the rest. See Walter Schmithals, *Gnosticism in Corinth* (tr. 1971), John Reuf, *Paul's First Letter to Corinth* (1972).

Corinthian War (395 B.C.–86 B.C.), armed conflict between Corinth, Argos, Thebes, and Athens on one side and Sparta on the other. Angered by Sparta's tyrannical overlordship in Greece after the Peloponnesian War, several Greek states took advantage of Sparta's involvement in war with Persia to challenge Spartan supremacy. With Persian aid, Athens was able to build a fleet, refortify its port, and eventually recover the islands of Lemnos (now Limnos), Scyros (now Skiros), and Imbros (now Imroz). Unable to fight a war on two fronts, Sparta withdrew its forces from Asia Minor. Meanwhile, Antalcidas, the Spartan agent in Persia, attempted to bring about peace with Persia and halt Persian support to the rebellious Greek states. He persuaded Artaxerxes II to agree to the so-called King's Peace, or Peace of Antalcidas, but the terms were those of the Persian king. Cyprus and the Greek city-states in Asia Minor were returned to Persia, the Athenians were forced to give up their conquests except Lemnos, Imbros, and Scyros, and the Greek city-states (except those in Asia Minor) were to be independent, thus eliminating combinations such as the Theban-dominated Boeotian League, which had fought against Sparta. Sparta interpreted the terms of peace to justify interference in the Greek states, which eventually revolted against its domination, thus bringing about the Spartan defeat by Thebes at LEUCTRA in 371 B.C.

Corinto (kôrĭn'tō), town (1970 est. pop. 12,985), NW Nicaragua, on the Pacific Ocean. It is a railroad terminus and Nicaragua's leading port. Coffee, sugar, hides, and woods are exported. U.S. Marines landed in Corinto in 1912, and it has a U.S. naval base.

Coriolanus (Gnaeus Marcius Coriolanus) (kôr'ē-ā-lā'nās), Roman patrician. He is said to have derived his name from the capture of the Volscian city Corioli. According to legend he was expelled from Rome because he demanded the abolition of the people's tribunate in return for distributing state grain to the starving plebeians. He joined the Volscians and led (491? B.C.) them in an attack on Rome. Only the tears of his wife and his mother caused him to spare the city. The angry and frustrated Volscians put him to death. Plutarch tells the story, and Shakespeare's *Coriolanus* is based on Plutarch.

coriolis effect [for G. G. Coriolis], tendency for any moving body on or above the earth's surface, e.g.,

an ocean current or an artillery round, to drift sideways from its course because of the earth's rotation. In the Northern Hemisphere the deflection is to the right of the motion, in the Southern Hemisphere it is to the left. The coriolis deflection of a body moving toward the north or south results from the fact that the earth's surface is rotating eastward at greater speed near the equator than near the poles, since a point on the equator traces out a larger circle per day than a point on another latitude nearer either pole. A body traveling toward the equator with the slower rotational speed of higher latitudes tends to fall behind or veer to the west relative to the more rapidly rotating earth below it at lower latitudes. Similarly, a body traveling toward either pole veers eastward because it retains the greater eastward rotational speed of the lower latitudes as it passes over the more slowly rotating earth closer to the pole. The coriolis effect on a body traveling east or west results from the fact that centrifugal force due to rotation acts directly outward at right angles to the axis of rotation and thus has a horizontal component relative to the earth's surface at all points other than those on the equator. A body traveling eastward relative to the earth's surface has an eastward rotational speed equal to the sum of the earth's speed and its own speed, it therefore experiences a greater centrifugal force, whose horizontal component deflects it toward the south. A body traveling westward relative to the earth's surface has an eastward rotational speed equal to the difference of the earth's speed and its own speed, it experiences a smaller centrifugal force than the earth below it and thus tends to fall inward toward the axis of rotation. The horizontal component of this deflection is toward the north. In most man-operated vehicles continuous course adjustments mask the coriolis effect so that it is generally ignored in these cases. It is, however, extremely important to account for the coriolis effect when considering projectile trajectories, terrestrial wind systems, and ocean currents.

Cork, Richard Boyle, 1st earl of: see BOYLE RICHARD, 1ST EARL OF CORK.

Cork, county (1971 pop. 351,735), 2,881 sq mi (7,462 sq km), SW Republic of Ireland. CORK is the county town. Largest of the Irish counties, it has a rocky and much-indented coast line (Bantry, Dunmanus, Roaringwater, Courtmarsherry, Clonakilty, and Youghal bays, and Kinsale and Cork harbors). The interior has wild rugged mountains rising as high as 2,239 ft (682 m) and fertile valleys (notably of the Bride, the Blackwater, the Lee, and the Bandon). The main occupations are farming (dairying, raising livestock, and growing grains and sugarbeets) and fishing. Manufacturing is centered around the city of Cork. CORK is an important transatlantic harbor. There are prehistoric remains (dolmens and stone circles) and ruins of medieval abbeys and churches.

Cork, county borough (1971 pop. 128,235), county town of Co. Cork, S. Republic of Ireland, on the Lee River near its mouth on Cork Harbour. The oldest part of the town is on an island between the north and south branches of the Lee, now crossed by numerous bridges. Exports are largely farm produce (dairy products, grain, livestock), cloth, and fish. Imports include coal, raw materials, fertilizers, grain, machinery, and automobile parts. Automobiles, rubber, leather, cotton, and woolen goods, paint, processed foods, flour, and whiskey are manufactured. St. Finbarr is supposed to have founded an abbey on the site early in the 7th cent. In the 9th cent. the Danes occupied Cork and walled it. Dermot MacCarthy ousted the Danes and in 1172 swore allegiance to Henry II of England. Oliver Cromwell occupied Cork in 1649, and the duke of Marlborough in 1690. Many public buildings were destroyed in the nationalist disturbances of 1920, and the SINN FEIN lord mayor was murdered by the constabulary. Terence MacSwiney succeeded him and died in jail in London after a hunger strike. Educational institutions include University College (constituent college of the National Univ. of Ireland) and a school of art. The Protestant St. Finbarr's Cathedral (designed by William Burges), the Roman Catholic cathedral, the Church of St. Ann, and the Carnegie library are noteworthy.

cork, protective, waterproof outer covering of the stems and roots of woody plants. Cork is a specialized secondary tissue produced by the cork cambium of the plant (see MERISTEM). The regularly arranged walls of cork cells are impregnated with a waxy material, called suberin, that is almost impermeable to water or gases. Cork is buoyant in water because of the presence of trapped air in the cavities of the waterproof dead cells. It is also resilient,

light, chemically inert, and, because of the suction cup action of the cut cells, adhesive. These qualities make cork valuable for bottle stoppers, insulating materials, linoleum, and many household and industrial items. See CORK OAK.

cork oak, name for an evergreen species of the oak genus (*Quercus*) of the family Fagaceae (BEECH family). The cork oak (*Q. suber*) is native to the Mediterranean region, where most of the world's commercial supply of CORK is obtained. It is cultivated elsewhere as an ornamental and has been introduced into warmer regions of the United States because of its economic value. The bark of the tree is stripped off (about every 10 years) and then processed for shipment as commercial cork. There is a cork layer in all trees but it is not as extensive or valuable as in the cork oak. Cork oak is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Fagales, family Fagaceae.

corkwood. see BOMBAX.

corm, short, thickened underground stem, usually covered with papery leaves. A corm grows vertically, producing buds at the upper nodes and roots from the lower surface. Corms serve as organs of food storage and in some plants (e.g., crocus and gladiolus) of asexual reproduction, they are often mistakenly called bulbs.

Cormenin, Louis Marie de La Haye, vicomte de (lŭē marē' də la ā vĕkōnĭt' də kōrmānē'), 1788-1868, French politician, jurist, and pamphleteer. He held minor offices under Napoleon, and after 1828 he sat almost continuously in the chamber of deputies. Under the pseudonym Timon he wrote numerous pamphlets against the government of Louis Philippe and in favor of liberal reforms. After the 1848 Revolution, Cormenin was influential in drawing up the new republican constitution. His works include the legal compilation *Questions de droit administratif* (1822), *Le Livre des orateurs* (1836), and *Entretiens de village* (1846).

cormorant (kôr'marant), common name for large aquatic birds, related to the gannet and the pelican, and found chiefly in temperate and tropical regions, usually on the sea but also on inland waters. Cormorants are 2 to 3 ft (61-92 cm) long, with thick, generally dark plumage and green eyes. The feet are webbed, and the bill is long with the upper mandible terminally hooked. Expert swimmers, cormorants pursue fish under water. In the Orient they are used by fishermen who collar the leashed birds to prevent them from swallowing the catch. The double-crested cormorant of the Atlantic coast, Brandt's cormorant of the Pacific coast, and the red-faced cormorant, *Phalacrocorax urile*, are common forms. The glossy black European cormorant is widely distributed in the Northern Hemisphere. A South American cormorant is a source of guano. The great cormorant nests high in trees or, as in other species, on steep, rocky sea cliffs. Two to six eggs per clutch are laid by the female. The young are born blind, and the parents feed the nestlings with half-digested food which is dropped into the nests. Later, the young birds poke their heads into the gullet of the adults to feed. Cormorants are long-lived, a banded one was observed after 18 years. Cormorants are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Pelecaniformes, family Phalacrocoracidae.

corn, in botany. The name corn is given to the leading cereal crop of any major region. In England, corn means wheat, in Scotland and Ireland, oats. The grain called corn in America is Indian corn or maize (*Zea mays*). The plant is a GRASS that was domesticated and cultivated in America long before Europeans reached the New World. It is so changed from the ancestral wild grass that this has not been identified with certainty, and it has been so adapted to cultivation that it never reverts to a wild state, it requires the care of man. It is probably a complex hybrid of several related New World grasses, e.g., teosinte (*Euchlaena mexicana*), a tropical American fodder plant in which the seeds are not united in a cob. The Indians had many varieties of corn, e.g., sweet corn, popcorn, and corn for corn meal. White, yellow, red, and blue corn were grown as distinct strains. The easily produced and readily identifiable strains of corn have made it a favorite subject for experimental genetics. The development of hybrid corn seed, now the basis of an independent, large-scale business, was an early (beginning of the 20th cent.) and revolutionary introduction of the principles of theoretical science into practical agriculture. At first ridiculed, the scientifically developed hybrids now represent almost all commercially grown corn types. They have resulted in higher

yields, increased sugar and lowered starch content, and uniform plants bred to specification for mechanical harvesting. As human food, corn is eaten fresh or ground for meal. It is the basic starch plant of Central and Andean South America, where it is still hand ground on metates to be made into tamales, tortillas, and other staple dishes. In the United States it is familiar as hominy, mush, and grits. Starch, sugar, and oil are also extracted for many products, but corn's chief use is as animal fodder. It is the primary feed grain of the United States (the world's largest producer), where more than half the annual crop is so used. In Europe this is almost the only use of corn. Corn was introduced by 17th-century explorers to all parts of the Old World, where it is now an important agricultural item. The part of the United States where most of the corn is grown, including Ohio, Illinois, Indiana, Missouri, Kansas, Iowa, and Nebraska, is known as the Corn Belt. The corn plant has a pithy noded stalk supported by prop roots. The staminate (male) flowers form the tassel at the top of the plant. The pistillate (female) flowers are the kernels on the cob, which is enclosed by a leafy husk beyond which extend thread-like styles and stigmas (the silk), which catch the pollen. The corn plant with its ornamental tassel and ears has been a motif of American art since prehistoric times. See H. A. Wallace and W. L. Brown, *Corn and Its Early Fathers* (1956); H. T. Walden, *Native Inheritance: The Story of Corn in America* (1966); G. E. Inglett, *Corn* (1970).

Cornaro, Caterina (katāre'na kōrā'rō), 1454-1510, queen of Cyprus. A celebrated Venetian beauty, she was married in 1472 to James II of Cyprus, who was eager to secure Venetian support. Venice was in turn interested in intervening in the affairs of the island. James II died in 1473, and his infant son, James III, in 1474. Caterina reigned amidst diplomatic intrigue and hostilities of native anti-Venetian factions until Venice forced her to abdicate (1489) and took Cyprus. Caterina returned to Venice and retired to Asolo. There she held a small but brilliant court, depicted by Pietro Bembo in his Platonic dialogue, *Gli Asolani*. A famous portrait of her by Titian is in the Uffizi.

Corn Belt, major agricultural region of the U.S. Midwest where corn acreage exceeds that of any other crop. Located in the north central plains, it is centered in Iowa and Illinois and extends into S Minnesota, SE South Dakota, E Nebraska, NE Kansas, N Missouri, Indiana, and W Ohio. Large-scale commercial and mechanized farming prevails in this region of deep, fertile, well-drained soils and long, hot, humid summers. The belt produces more than half of the U.S. corn crop. Corn is raised mainly as feed for livestock, especially hogs, which are the main source of cash income. Winter wheat, soybeans, and alfalfa are also important crops in the area.

corn borer or European corn borer, common name for the larva of a moth of the family Pyralidae, introduced from S Europe into the Boston area in 1917. The corn borer, *Ostrinia nubilalis*, has steadily spread southward into the Gulf States and northward and westward across the continent to the Rocky Mts. It also still occurs in most of Europe and parts of Asia. The full-grown larva is about 1 in. (2.5 cm) long, with a dark brown head and pinkish body. It is a major pest of all types of corn, its host preference, but also attacks many other cultivated crops, (e.g., sorghum, soybeans, and potatoes) and flower plants (e.g., dahlias, asters, and gladioli). The newly hatched yellowish larvae cause damage by feeding on the leaves of the host plant, older larvae bore into the stalk thereby severely weakening the plant and causing ear damage, which results in a loss in yield and reduction of quality. The full-grown larvae overwinter in cornstalks, corn cobs, and debris on the ground. Adults emerge in the spring and are brownish with zigzag streaks across the tips of the forewings. There are sometimes more than one generation per year depending on an increased length of the host's growing season. Control of these pests is complicated by the fact that the larvae also infest common weeds and wild grasses growing near the cornfields. For insecticidal control, see bulletins of the U.S. Dept. of Agriculture. Corn borers are classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera, family Pyralidae.

Cornbury, Edward Hyde, Viscount, 1661-1723, colonial governor of New York and New Jersey (1702-8). He deserted the army of James II and ingratiated himself with William of Orange (William III). Appointed governor by William, he became extremely unpopular, and his administration was a pe-

riod of turmoil in both provinces. After his removal, he was imprisoned for debt in New York, but upon becoming 3d earl of Clarendon in 1709 he was able to free himself and return to England. See Herbert L. Osgood, *The American Colonies in the Eighteenth Century*, Vol. II (1924).

cornea: see EYE

corn earworm or cotton bollworm, destructive larva of a moth, *Heliothis zea*. Also known as tomato fruitworm, the larva attacks a variety of crops, boring into and feeding on the developing fruits—tomatoes, corn kernels, or cotton bolls. The adult moth is pale yellow. It is classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera, family Noctuidae.

Cornille (Cornelis van Beverloo) (kōrnā'ya), 1922-, Belgian painter. Cornille was a member of CoBrA, the European group allied with ABSTRACT EXPRESSIONISM. His work is characterized by linear, weblike configurations that often form broken representational elements.

Cornille, Pierre (pyēr kōrnā'ya), 1606-84, French dramatist, ranking with Racine as a master of French classical tragedy. Educated by Jesuits, he practiced law briefly in his native Rouen and moved to Paris after the favorable reception of his first play, *Mélite* (1629), a comedy. His first tragedy, *Medée* (1635), was followed by *Le Cid* (1637). This masterpiece, based on a Spanish play about the Cid, took Paris by storm, "beautiful as the Cid" became a French proverb. However, Jean Chapelain composed a paper for the newly founded French Academy that attacked the play as plagiaristic and faulty in construction, and thereafter Cornille adhered to classical rules. Among the finest of his score of tragedies that followed are *Horace* (1640), *Cinna* (1640), and *Polyeucte* (1643). The comedy *Le Menteur* (1643) had great success. Cornille's tragedies exalt the will at the expense of the emotions, his tragic heroes and heroines display almost superhuman strength in subordinating passion to duty. At his best, Cornille was a master of the grand style, powerful and majestic. His last plays are marred by monotonous declamation. Cornille's old age was embittered by the rise of Racine, who replaced him in popular favor. See study by D. A. Collins (1966).

cornel: see DOGWOOD

Cornelia, fl. 2d cent. B.C., Roman matron, daughter of Scipio Africanus Major. She was the wife of Tiberius Sempronius Gracchus and mother of the GRACCHI. She refused to remarry after her husband's death, devoting herself to her children, whom she educated well and inspired with a sense of civic duty and a desire for glory. When a wealthy patrician woman spoke of her jewels, Cornelia pointed to her two sons, saying, "These are my jewels!" Whether she supported the revolutionary tendencies of her sons or tempered them is debated by historians.

cornelian: see CARNELIAN

cornelian cherry: see DOGWOOD

Cornelius, Saint, d. 253, pope (251-253), successor of St. Fabian. His rule was marked by the support of St. Cyprian and the opposition of the antipope NOVATIAN, and by the problem of readmitting to the church Christians who apostatized during persecution. Cornelius was martyred under Gallus. He was succeeded by St. Lucius I. He is mentioned in the Canon of the Mass. Feast: Sept. 16.

Cornelius, centurion of an Italian cohort stationed at Caesarea, one of the first Gentile converts and traditionally first bishop of Caesarea. Acts 10.

Cornelius, Peter (pā'tēr kōrnā'lēōs), 1824-74, German composer and poet, follower of Liszt and Wagner. He wrote music criticism, songs, and poetry but is best known for his operas *Der Barbier von Bagdad* (1858) and *Der Cid* (1865).

Cornelius, Peter von, 1783-1867, German painter. He studied at Dusseldorf and in Rome, where he joined the German NAZARENE group and collaborated with other members in the decoration of the Casa Bartoldy. In 1820 he was commissioned by Louis I of Bavaria to paint the fresco decorations in the Glyptothek, Munich. *The Last Judgment* was one of his fresco decorations for the Ludwigskirche, Munich. Cornelius believed that art should express noble ideals, and he disdained to work from nature. His favorite themes were religious or philosophical. In addition to his painting, Cornelius produced illustrations for *Faust* and the *Nibelungenlied* and designs for the decoration of the royal mausoleum, done for Frederick William II of Prussia.

Cornelius Nepos: see NEPOS, CORNELIUS

Cornell, Alonzo B. (kōrnē'l'), 1832-1904, American businessman and politician, b. Ithaca, N.Y. Cornell

was a director (1868-99) and vice president (1870-76) of the Western Union Telegraph Company, founded by his father, Ezra Cornell. A supporter of Senator Roscoe CONKLING, he was surveyor of customs (1869-73) at the port of New York, chairman (1870-78) of the Republican state central committee, and speaker (1873) of the New York assembly. President Grant, just before leaving office, appointed him naval officer in the New York customhouse. President Hayes, in an attempt to wrest control of the port of New York customhouse from the Conkling machine, brought pressure upon him to resign because of his official party connection. Cornell refused, and though strongly supported by Conkling, he and Chester A. Arthur, the collector of the port of New York, were removed in 1878. Cornell was promptly chosen governor of New York for the term 1880-83. He modernized the state finances, made good appointments, and vetoed much extravagant legislation. By not taking sides in the patronage fight between President Garfield and Conkling in 1881, he contributed to Conkling's defeat in the legislature and was himself defeated for renomination as governor. He wrote a biography of his father (1884). See his public papers (3 vol., 1880-82).

Cornell, Ezra, 1807-74, American financier and founder of CORNELL UNIVERSITY, b. Westchester Landing, N.Y. Cornell, who began life as a laborer, was of an ingenious mechanical bent and had a shrewd business mind. He aided in constructing (1844) the telegraph line between Baltimore and Washington, D.C., over which Samuel F. B. Morse sent the first test message. Having devised the method of stringing wires on poles, he entered into line construction in the East and the Midwest. He was founder, director, and for a time the largest stockholder of the Western Union Telegraph Company, which was formed in 1855 to end cutthroat competition in the field. His interest in agricultural education led to his association in the New York senate with Andrew Dickson WHITE, and together they mapped and secured legislation for founding (1865) Cornell Univ., with a charter embracing many of Cornell's ideas. He made many gifts to the university, including an initial \$500,000, and was responsible for the successful financial returns on the university's Federal land grant. See biographies by his son, Alonzo Cornell (1884), and Philip Dorf (1952, abr. ed. 1965).

Cornell, Joseph, American artist, 1903-73, b. Nyack, N.Y. Cornell is best known for his surrealist-influenced shadow boxes. These are small constructions, within glass-fronted, shallow boxes or frames, made of found objects, maps, photographs, and engravings. Their selection and arrangement are nostalgic and personally symbolic. Cornell's *Hôtel du Nord* (c. 1953, Whitney Mus., New York City) is a representative work.

Cornell, Katharine, 1898-1974, American actress, b. Berlin. Cornell made her debut in 1916 with the Washington Square Players. In 1921 she married Guthrie McClintic, a producer-director. From their first production together, *The Green Hat* in 1925, they proved to be a successful team, with such productions as *The Barretts of Wimpole Street* (1931, repeated on television, 1956), *Saint Joan* (1936), *Candida* (1937), *The Doctor's Dilemma* (1941), and *The Three Sisters* (1942). She was among the first major American performers to form a repertory company, she took several entire New York casts and productions on the road. Cornell played Mrs. Patrick Campbell in *Dear Liar* on Broadway in 1960. After McClintic's death in 1961, Cornell retired from the theater. See her autobiography (1939), Guthrie McClintic, *Me and Kit* (1955).

Cornell University, mainly at Ithaca, N.Y., with land-grant, state, and private support, coeducational, chartered 1865, opened 1868. It was named for Ezra CORNELL, who donated \$500,000 and a tract of land. With the help of state senator Andrew D. WHITE, who became Cornell's first president, it was made the state land-grant institution. Cornell University Medical College, affiliated with New York Hospital, Bellevue Hospital, and the Memorial Center for Cancer and Allied Diseases, is in New York City. The university operates an aeronautical laboratory at Buffalo, the New York Agricultural Experiment Station (Geneva), and the Cornell Agricultural Experiment Station (Ithaca), and is affiliated with the Brookhaven National Laboratories (Long Island). Of note on Cornell's campus are the U.S. plant, soil, and nutrition laboratory, the Savage school of nutrition, and the laboratory of nuclear physics, which includes a reactor and a synchrotron. In Puerto Rico the university operates a large radar station for investigations of the upper atmosphere and outer space. The colleges of agriculture, home economics,

veterinary medicine, and the school of industrial and labor relations are divisions of the State University of New York. See M. G. Bishop, *A History of Cornell* (1962), K. C. Parsons, *The Cornell Campus* (1968), R. F. Howes, *A Cornell Notebook* (1971).

corner, securing of all or nearly all the supply of any commodity or stock so that its buyers are forced to pay exorbitant prices. Corners may be planned deliberately or may be brought about unintentionally, as through a fight for controlling interest in a corporation's stock. In the first type the operator acquires control of the particular commodity or shares and then induces other operators to promise to sell the commodity or stock by raising the market price to an unusually high level. The cornerer purchases such promises to sell. When the cornerer thinks he can make the biggest profit, he withdraws all his shares from the market, and those who have promised to sell find themselves "cornered", that is, they have to buy stock from the cornerer at his own price to fulfill their contracts. The cornerer sets the price just low enough to keep the dealers from repudiating their contracts. To be successful, cornerers must have enough money to buy the necessary amount of shares or commodity. The Bible describes Joseph's corner of the grain in Egypt. A famous deliberate corner was Jim Fisk's and Jay Gould's corner of the U.S. gold supply in 1869; the move was frustrated when the Federal government placed its own gold supply on sale. A notable illustration of the unintentional corner was that on the stock of the NORTHERN PACIFIC RAILWAY in 1901. Deliberate corners and other forms of price manipulation on the various stock and commodity exchanges are now illegal in the United States. The Securities and Exchange Commission, the New York Stock Exchange, and the Dept. of Agriculture seek to prevent corners.

Corner Brook, city (1971 pop. 26,309), W. central N.F., Canada, on the Humber River. It is Newfoundland's second largest city and has a large pulp and paper mill. Nearby is Gros Morne National Park.

cornet, brass wind musical instrument, created in France about 1830 by adding valves to the post horn. It is usually in B flat and is the same size as the B flat trumpet, but has a more conical bore. The cornet, a TRANSPOSING INSTRUMENT, has a less brilliant tone but greater agility than the trumpet. It has long been a

Cornet

standard instrument in bands. In the orchestra, especially in France, the cornet is used with the trumpet. It should not be confused with the cornett, an instrument of the Middle Ages and Renaissance, which used a cup mouthpiece on a wooden or ivory body supplied with fingerholes similar to those on woodwinds. A bass cornet, the serpent, so called because of its twisted shape, was used until the early 19th cent.

cornflower, common herb (*Centaurea cyanus*) of the family Compositae (COMPOSITE family). It is a garden flower in the United States but a weed in the grainfields of Europe. It is called bluebottle or bluet in England and bluebonnet in Scotland; in North America the cornflower shares with other plants the names ragged robin, bachelor's-button, or ragged sailor. The long-stemmed blue heads of the flowers, having radiating bottle- or vase-shaped florets, yield a juice which, mixed with alum, has been used as a dye. Cornflowers are classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Asterales, family Compositae.

cornice (kôr'nīs), molded or decorated projection that forms the crowning feature at the top of a building wall or other architectural element, specifically, the uppermost of the three principal members of the classic ENTABLATURE, hence by extension any similar crowning and projecting element in the decorative arts. The term is also employed for any projection on a wall that is provided to throw rainwater off the face of the building. The cornice undoubtedly had its origin in the primitive eave projection the Greek Doric and Ionic cornices recall early wooden roof forms, and the Egyptian cavetto and fillet cornice is a derivation of the overhanging papyrus stalks that formed the eaves of primitive shelters. The cornice early lost its structural significance and became a stylized decorative element, in

the Greek and Roman eras it assumed firmly standardized forms in the classical orders that were retained, with variations, through the Renaissance and later periods. As an element in the classical entablature the cornice is composed of the cymatium, or crown molding, above the corona, the projecting flat member, which casts the principal shadow, in this shadow, and supporting the corona, are a group of moldings called the bed molds, which may be elaborated with dentils. The Corinthian and Composite cornices are further embellished with modillions, or brackets, under the corona, the soffit of the Doric corona is decorated with square, flat projections called mutules, having guttae, or small knobs, hanging from their lower surfaces.

Corning, city (1970 pop. 15,792), Steuben co., S. N.Y., on the Chemung River, in a dairy and vineyard region, settled 1788, inc. as a city 1890. The glass industry, for which the city is famous, began there in 1868, and the Corning glass museum is a major tourist attraction today. A junior college and a museum of western art are located in the city, and a number of state parks are in the area. In 1972, in the wake of Hurricane Agnes, the city was heavily damaged by floodwaters from the Chemung River.

Cornish, dead language belonging to the Brythonic group of the Celtic subfamily of the Indo-European family of languages. See CELTIC LANGUAGES.

Cornish hen or **Cornish chicken**, breed of POULTRY that originated in Cornwall, England, but gained prominence only after it was established in the United States. Its body shape is quite different from that of other chickens. Both males and females have short legs and broad muscular breasts. Although relatively slow-growing, the Cornish hen has excellent meat qualities and is used extensively in breeding programs today. Its cross with the fast-growing PLYMOUTH ROCK CHICKEN is responsible for most of the broiler and fryer types currently on the market. An increasingly popular form of Cornish poultry, marketed for its delicious meat, is the Rock Cornish game hen. This is actually a standard meat-type chicken packaged at a smaller size.

Cornish literature. The literature of the Celtic language of Cornwall, which disappeared before 1800, consists largely of a few MIRACLE PLAYS, mostly of the 15th cent. With the exception of the *Life of St. Meriasek*, they are usually on biblical subjects. The plays closely resemble Breton drama. Also surviving is the Middle Cornish narrative poem *The Passion of Our Lord*. See R. M. Longworth, *The Cornish Ordinalia* (1967), Edwin Norris, ed., *Ancient Cornish Drama* (2 vol., 1859, repr. 1968).

corn laws, regulations restricting the export and import of grain, particularly in England. As early as 1361 export was forbidden in order to keep English grain cheap. Subsequent laws, numerous and complex, forbade export unless the domestic price was low and forbade import unless it was high. The purpose of the laws was to assure a stable and sufficient supply of grain from domestic sources, eliminating undue dependence on foreign supplies, yet allowing for imports in time of scarcity. The corn law of 1815 was designed to maintain high prices and prevent an agricultural depression after the Napoleonic Wars. Consumers and laborers objected, but it was the criticism of manufacturers that the laws hampered industrialization by subsidizing agriculture that proved most effective. Following a campaign by the ANTI CORN LAW LEAGUE, the corn laws were repealed by the Conservative government of Sir Robert Peel in 1846, despite the opposition of many of his own party, led by Lord George Bentinck and Benjamin Disraeli. With the revival of protectionism in the 20th cent., new grain restriction laws have been passed, but they have not been as extensive as those of earlier times. See D. G. Barnes, *A History of English Corn Laws from 1660 to 1846* (1930, repr. 1965).

Corno, Monte (môn'tā kôr'nō), highest peak of the Apennines, c. 9,560 ft (2,910 m) high, in the Gran Sasso d'Italia range, Abruzzi, central Italy. It is snow-capped for most of the year.

Cornouaille (kôr'nwī'), district of Brittany, NW France, comprising parts of Finistère, Côtes-du-Nord, and Morbihan depts. The name was probably brought by Britons who fled Cornwall at the time of the Anglo-Saxon invasions (c. 500).

Cornplanter, c. 1740-1836, chief of the Seneca Indians. The son of an Indian woman and a white father, he acquired great influence among the Seneca Indians and in the American Revolution led war parties for the British against the colonial forces, particularly against Gen. John Sullivan in New York. He later favored friendship with the whites and

signed the Treaty of Fort Stanwix (1784). He was given a grant of land on the Allegheny River, where he lived to a very old age. His views were opposed by the energetic RED JACKET but supported by HANDSOME LAKE (Cornplanter's half brother).

corns and calluses, thickenings of the outer layer of SKIN where there is irritation or constant pressure. Corns are cone-shaped with their points protruding into the dermis, or inner layer of skin. They usually have hard, shiny surfaces surrounded by red, painful areas. Soft-surfaced corns sometimes develop between overlapping toes where there is an accumulation of moisture. Treatment of corns is directed at the relief of irritation or pressure, e.g., wearing properly fitted shoes; they can also be softened by pastes and ointments or removed by a physician. Calluses typically involve only the outermost layers of skin and are not usually painful; they tend to disappear once the source of irritation has been removed. See BUNION.

cornstarch, material made by pulverizing the ground, dried residue of corn grains after preparatory soaking and the removal of the embryo and the outer covering. It is used as laundry starch, in sizing paper, in making adhesives, and in cooking. DEXTRIN, corn syrup, and corn sugar are produced by the hydrolysis of cornstarch. See STARCH.

Cornu, Marie Alfred (marē' alfrēd' kôrnu'), 1841-1902, French physicist. From 1867 he was professor at the École polytechnique, Paris. He measured the velocity of light and made important contributions to spectrum analysis, astronomy, and optics. Cornu's spiral, a curve for calculating light intensities in Fresnel diffraction, is named for him.

cornucopia (kôr'nyōōkō'pēā), in Greek mythology, a magnificent horn that filled itself with whatever meat or drink its owner requested. Some legends designate it as a horn of the river god Achelous, others as a horn of the goat Amalthaea. It is often represented as filled with fruits and flowers and has become the symbol of plenty.

Cornwall, Barry, pseud. of Bryan Waller Procter, 1787-1874, English author. His sentimental songs were much in vogue during his lifetime. Included among Cornwall's longer works are *Dramatic Scenes* (1819) and *Mirandola* (1821), a tragedy. He enjoyed the friendship of many of the notable men of his time, including Charles Lamb, of whom he wrote a biography which appeared in 1866. He was the father of the poet Adelaide Procter. See his *Literary Recollections* (ed. by R. W. Armour, 1936), biography by R. W. Armour (1935).

Cornwall, county (1971 pop. 379,892), SW England. The county town is BODMIN. Cornwall is a peninsula bounded seaward by the English Channel and the Atlantic Ocean and landward by Devonshire. It terminates in the west with the rugged promontory of Lands End. The region is a low-lying plateau, rising to its greatest height at Brown Willy (1,375 ft/419 m) in Bodmin Moor. The principal rivers are the Tamar, which forms most of the border with Devonshire, the Fowey, the Fal, and the Camel. In the beautiful river valleys are productive vegetable and dairy farms. The uplands are used for sheep and cattle pasturage. The climate is mild and moist, with subtropical vegetation along the southern coast. Cornwall is an important source of china clay. Various types of fish are caught, including pilchard, which are not plentiful elsewhere in Britain. Cornwall has produced many of Britain's finest sailors. Engineering, ship repairing, and rock quarrying are the only industries. Cornish tin and copper mines were known to ancient Greek traders, and during World War II the old mines were reworked. Cornwall's climate, the picturesque coastal towns (Penzance, Falmouth, and St. Ives), and the romance of its past, interwoven with Arthurian legend and tales of piracy, have made the region popular with tourists. Cornwall's history has been somewhat distinct from that of the rest of England. The Cornish language, related to the Welsh and Breton tongues, did not die out until the 18th cent. The county long resisted Saxon penetration. It was organized in the 14th cent. as a duchy. (The monarch's eldest son is the Duke of Cornwall.) Cornwall was slow to accept the Reformation. In 1549 thousands of Cornishmen marched to defend the Roman Catholic Church service. In the 18th cent. the Wesleyan movement took a firm hold in Cornwall, which has remained predominantly Methodist until the present day. In 1974, Cornwall was reorganized as a nonmetropolitan county.

Cornwall, manufacturing city (1971 pop. 47,116), SE Ont., Canada, on the St. Lawrence River. Its principal manufactures are cotton and rayon textiles, pa-

per, chemicals, and electronic equipment. The headquarters of the Canadian St Lawrence Seaway Authority are in Cornwall. The historical Indian village of St Regis is across the river on the Quebec-New York boundary.

Cornwallis, Charles Cornwallis, 1st Marquess, 1738-1805, English general and statesman. He was commissioned an ensign in the British army in 1756 and saw service in Europe in the Seven Years War. As a member of Parliament (which he entered in 1760), he opposed the tax measures that helped bring on the AMERICAN REVOLUTION. When the war came, however, he placed himself at the king's service and was sent (1776) to America. He served under Gen. William Howe at the battle of Long Island, in the New Jersey campaigns, and at the battle of Brandywine, acquitting himself with credit in all the engagements. In 1778, Cornwallis became second in command to Sir Henry CLINTON, British commander in America. Two years later Cornwallis began the fateful CAROLINA CAMPAIGN, which led directly to the YORKTOWN CAMPAIGN and the major British defeat that in 1781 ended the fighting. Cornwallis was not held responsible for the disaster and in 1786 became governor general of India. There he reformed the civil service and the judiciary and distinguished himself in the campaigns against TIPPOO SAHIB of Mysore. He was created a marquess in 1792 and returned to England in 1794. In 1798, Cornwallis was sent to Ireland as viceroy and commander in chief, and he was stern in repressing the rebellion there in the same year. He worked to achieve the Act of Union (1800), which initiated the unhappy experiment of uniting the Irish and British parliaments, but he resigned (1801) with William Pitt when George III refused to accept CATHOLIC EMANCIPATION. Cornwallis was then commissioned British minister plenipotentiary and helped to draw up the Treaty of Amiens (1802), which temporarily halted the war with Napoleonic France. In 1805 he was again appointed governor general of India, but he died two months after his arrival there. See his correspondence (ed. by Charles Ross, 3 vol., 1859), Arthur Aspinall, *Cornwallis in Bengal* (1931), Frank and Mary Wickwire, *Cornwallis the American Adventure* (1970).

Coro (kō'rō), city (1970 est. pop. 56,000), capital of Falcon state, NW Venezuela, 7 mi (11.3 km) from the Caribbean Sea, and at the base of the Paraguaná peninsula. The development of the oil industry on the peninsula stimulated rapid expansion of the city. Coffee, hardwoods, hides, and tobacco are exported through its port of La Vela. Founded in 1527, Coro became the base for Spanish explorations into the interior. From 1528 to 1546 it was mortgaged by the Spanish to a German banking house, and during this time German adventurers explored the region.

corolla, see PETAL.

corollary: see THEOREM.

Coromandel Coast (kōrōmān'dāl), east coast of Tamil Nadu and Andhra Pradesh states, SE India, stretching more than 400 mi (644 km) from Point Calimere, opposite the northern tip of Sri Lanka to the delta of the Krishna River. Its major cities, Nagapattinam, Pondicherry, and Madras, are ports. The inland coastal plain is bounded by the Eastern Ghats and includes the valleys of the Krishna, Pennar, and Cauvery rivers. The name probably stems from Cholomandalam, i.e., land of the Cholas, an empire that ruled the region from the 9th to the 12th cent.

Corona (kōrō'nā), city (1970 pop. 27,519), Riverside co., S Calif., inc. 1896. Citrus fruits are processed and castings, plywood paneling, fiberglass insulation, pipes, valves, and mobile homes are manufactured in the city. Cleveland National Forest is on Corona's western boundary.

corona, luminous envelope surrounding the SUN, outside the chromosphere. The corona is visible only at the time of totality during a total eclipse of the sun. It then appears as a halo of light with an irregular outer edge, radiating from the sun's surface and contrasting with the dark lunar disk that it borders. It is divided into the inner corona, a ring of pale-yellow light against which crimson prominences are outlined, and the outer corona, a pearly white halo that extends far out into space. Scientists are nearly in accord in believing that it consists of extremely fine particles of matter and that its luminosity results partly from sunlight reflected by the particles and partly from its own light. By means of the CORONAGRAPH, the corona can be studied and photographed in full daylight. At its base, the corona has a temperature of 1,000,000°C and is completely ionized. Studies have shown that the corona extends throughout the solar system. Just above the

chromosphere, the corona is almost static, rising very slowly. Its velocity increases with increasing distance from the sun, near the earth it is moving with supersonic speed and is known as the SOLAR WIND.

Corona Borealis (bōrēāl'ās) [Lat., =the northern crown], northern CONSTELLATION lying between Hercules and Boötes. Its name derives from the crown Bacchus gave Ariadne when she was deserted by Theseus. The constellation is a small arc of bright stars, of which the brightest is Alphecca (Alpha Corona Borealis). Corona Borealis reaches its highest point in the evening sky in early July.

Coronado, Francisco Vázquez de (franthes'kō vās'kāth dā kōrōnā'thō), c. 1510-1554, Spanish explorer in the Southwest. He went to Mexico with Viceroy Antonio de Mendoza and in 1538 was made governor of Nueva Galicia. The viceroy, dazzled by the report of Fray MARCOS DE NIZA of the great wealth of the Seven Cities of Cibola to the north, organized an elaborate expedition to explore by sea (see ALARCÓN, HERNANDO DE) and by land. Coronado, made captain general, set out in 1540 from Compostela, crossed modern Sonora and SE Arizona, and reached Cibola itself—the Zuñi country of New Mexico. He found neither splendor nor wealth in the Indian pueblos. Nevertheless he sent out his lieutenants. Pedro de Tovar visited the Hopi villages in N Arizona, García López de Cardenas discovered the Grand Canyon, and Hernando de Alvarado struck out eastward and visited Acoma and the pueblos of the Rio Grande and the Pecos. Alvarado came upon a Plains Indian nicknamed the Turk, who told fanciful tales of the wealthy kingdom of QUIVIRA to the east. Coronado, still hopeful, spent a winter on the Rio Grande not far from the modern Santa Fe, waged needless warfare with the Indians, then set out in 1541 to find the promised land of Quivira under the lying guidance of the Turk. Just where the party went is not absolutely certain, but it is generally thought they journeyed in the Texas Panhandle, reached Palo Duro Canyon (near Canyon, Texas), then turned N through Oklahoma and into Kansas. They reached Quivira, which turned out to be no more than Indian villages (probably of the Wichita), innocently empty of gold, silver, and jewels. The Spanish turned back in disillusion and spent the winter of 1541-42 on the Rio Grande, then in 1542 left the northern country to go ingloriously back to Nueva Galicia and into the terrors of the MIXTÓN WAR. In 1544, Coronado was dismissed from his governorship and lived the rest of his life in peaceful obscurity in Mexico City. He had found no cities of gold, no El Dorado, yet his expedition had acquainted the Spanish with the PUEBLO INDIANS and had opened the Southwest. Subsidiary expeditions from Nueva Galicia to S Arizona and Lower California make the scope of Coronado's achievement even more astonishing. See F. W. Hodge and T. Hays Lewis, ed., *Spanish Explorers in the Southern United States*, Vol. II (1907), G. P. Hammond and Agapito Rey, ed., *Narratives of the Coronado Expedition* (1940), A. Grove Day, *Coronado's Quest* (1940, repr. 1964), Herbert E. Bolton, *Coronado on the Turquoise Trail* (1949).

Coronado (kōr'ōnā'dō), city (1970 pop. 20,910), San Diego co., S Calif., on a peninsula on the west side of San Diego Bay, inc. 1890. It is a well-known beach resort. Adjacent to the city are a large U.S. naval air station and a naval amphibious base. Points of interest include the Hotel del Coronado, a state historical monument.

Coronado National Memorial: see NATIONAL PARKS AND MONUMENTS (table).

coronagraph (kōr'ōnagrāf), device invented by the French astronomer B. Lyot (1931) for the purpose of observing the CORONA of the sun and solar prominences occurring in the CHROMOSPHERE. Because of the intense light of the sun, the PHOTOSPHERE, corona, and chromosphere can ordinarily be seen only during a total ECLIPSE. The coronagraph consists of two refracting telescopes in tandem. A solid disk placed in front of the prime focus of the first telescope plays the part of the moon and eclipses the sun's image in the telescope so that only the outer layers of the sun's atmosphere are focused by the second telescope onto photographic film. A monochromatic filter is also used to improve optical clarity and remove chromatic aberration.

coronary artery disease, condition that results when the coronary arteries are narrowed or occluded, most commonly by atherosclerotic deposits of fibrous and fatty tissue. A coronary thrombosis (heart attack) is precipitated when the lumen of an artery, usually already narrowed by atherosclerosis, is completely blocked by a thrombus (blood clot).

Coronary artery disease is the commonest underlying cause of cardiovascular disability and death. Men are affected about four times as frequently as women, before the age of 40 the ratio is eight to one. Other predisposing factors are hypertension, diabetes, high cholesterol levels, and heavy cigarette smoking. The primary symptom of the condition is ANGINA PECTORIS, a pain that radiates in the upper left quadrant of the body.

coronary heart disease, see CORONARY ARTERY DISEASE.

coronation, ceremony of crowning and anointing a sovereign on his or her accession to the throne. Although a public ceremony inaugurating a new king or chief had long existed, a new religious service was added when Europe became Christianized. The service, derived from Old Testament accounts of the anointing of Saul and David by Samuel, helped to alter the concept of kingship, because anointment was thought to endow a prince with divine blessing and some degree of priestly (possibly even divine) character. In England, from the coronation (973) of Edgar, the ceremony included a coronation oath, anointment, investiture, enthronement, and homage. The pageantry of the English coronation, which since 1066 has taken place in Westminster Abbey, is still that of medieval times. In France, Pepin the Short, first king of the Carolingian line, was twice anointed by popes, partly to legitimize his supersession of the Merovingian dynasty. Later the French coronation came to resemble the English form, which was probably introduced into France in the 10th cent. The custom whereby the Holy Roman emperor was crowned by the pope dates from the coronation of Charlemagne on Christmas Day, 800. The anointing of the emperor by the pope was instituted by Louis I in 816. In 1804, Napoleon I brought Pope Pius VII to Paris to crown him in Notre Dame cathedral, but, in a famous episode, he seized the crown from the pope's hands and crowned himself.

Coronel (kōrōnēl'), city (1970 pop. 73,568), S central Chile, a port on the Pacific Ocean. It is a major coal-iron station and a shipping point for the coal from nearby mines. In a naval engagement off Coronel on Nov. 1, 1914, during World War I, German Admiral Graf von Spee defeated a British squadron under Sir Christopher Cradock, a triumph offset later by the battle of the Falklands.

coroner, judicial officer responsible for investigating deaths occurring through violence or under suspicious circumstances. The office has been traced to the late 12th cent. Originally the coroner's duties were primarily to maintain records of criminal justice and to take custody of all royal property. In England this second function persists in his jurisdiction over TREASURE-TROVE. In his present-day work of determining cause of death, the coroner proceeds by means of the INQUEST whenever there is doubt. In several of the United States the coroner has been replaced by the medical examiner, who can only conduct POST-MORTEM EXAMINATIONS, and who works in cooperation with the public prosecutor.

coronet (kōr'anēt, kōrānēt'), head attire of a noble of high rank, worn on state occasions. It is inferior to the crown. British peers wear their coronets at the coronation of their sovereign. Although dukes wore coronets to mark their rank by the 14th cent., it was in the reign of Elizabeth I that individual patterns were adopted for other peers, and barons received distinguishing insignia in 1661. The coronet of a duke is bordered by 8 strawberry leaves, that of a marquess, by 4 strawberry leaves alternating with 4 silver balls (sometimes called pearls) on low points, that of an earl, by 8 strawberry leaves alternating with 8 silver balls on high points, that of a viscount, by 16 silver balls on the rim, that of a baron, by 6 silver balls on the gold rim.

Corot, Jean-Baptiste Camille (zhaN-batēst' kamē'yā kōrō'), 1796-1875, French landscape painter, b. Paris. Corot was one of the most influential of 19th-century painters. The son of shopkeepers, he worked in textile shops until 1822, when he began to study painting. The classical landscape painters Michallon and Bertin were his teachers. In 1825 he made his first trip to Italy, during which he painted calm, solid, and exquisitely composed groups of Roman buildings (e.g., *View of the Farnese Gardens*, 1826, Phillips Coll., Washington, D.C.). Upon his return to France he lived mostly in the Ville d'Avray, which formed the subject of many of his celebrated paintings, including two in the Metropolitan Museum. He worked in Italy again in 1834 and 1843, and traveled in Switzerland, Holland, and England. Corot exhibited regularly at the Salon from 1827. His work lay outside the contemporary controversy con-

cerning classicism and romanticism and, indeed, outside the theories of the Barbizon school, with which his name is often linked. Corot's landscapes celebrate the countryside without idealizing the peasant or romanticizing farm labor. He used sketches made directly from nature to aid his studio compositions, sometimes painting entire landscapes outdoors. In Rome he created works notable for their simplicity of form and clarity of lighting, such as the *Coliseum* and the *Forum* (both Louvre). His later landscapes, more lyrical in tone and painted primarily in shades of gray and green, were more popular. His delicate handling of light is especially evident in *Femme à la Perle* (Louvre) and *Interrupted Reading* (Art Inst., Chicago). Today Corot's work is highly valued, his figure studies and portraits being particularly sought after. His work is represented in most of the prominent galleries of England, France, and the United States. See studies by Jean Leymarie (tr 1966) and Yvon Taillandier (tr 1967).

corporal punishment, physical chastisement of an offender. It may include the death penalty (see CAPITAL PUNISHMENT), but the term usually refers to such practices as flogging, mutilation, branding, and confinement in the pillory or stocks. Until c1800 most crimes were punished thus (rather than by imprisonment) in many parts of the world. Flogging was especially prevalent, being used also to keep order among the institutionalized insane and in the schools as well as in armed forces. A movement against the use of corporal punishment was led in the late 17th cent by American Quakers who achieved local reforms in Pennsylvania and New Jersey. The 18th cent saw a reaction against the whole concept of violent punishment and the substitution of what were considered more humane methods. The effectiveness of corporal punishment has been questioned by modern criminologists and educators. Flogging, however, is still used in some countries, including the Republic of South Africa, and is used, often unofficially, to maintain discipline within some British and American prisons. Corporal punishment, usually caning or spanking, is also common in the schools of many areas of the United States and Great Britain, although the practice appears to be declining.

corporation, in law, organization enjoying legal personality for the purpose of carrying on certain activities. Most corporations are businesses for profit; they are usually organized by three or more subscribers who raise capital for the corporate activities by selling shares of stock, which represent ownership and are transferable. Besides business corporations, there are also charitable, cooperative, municipal, and religious corporations, all with distinctive features. In the United States all governmental units smaller than a state (e.g., counties, cities) are municipal corporations. Certain religious functionaries (e.g., Roman Catholic archbishops) legally are corporations sole. The legal personality of a corporation is symbolized by its seal and its distinctive name. As a legal person, the corporation continues in existence when the organizers lose their connection with it. In most cases its liability is limited to the assets it possesses and creditors may not seize property of persons associated with the corporation as stockholders or otherwise. Legal personality gives the corporation many of the capacities of a natural person, e.g., it can hold property and can even commit crimes (for which it may be fined and its directors imprisoned). The corporate form was known in Rome, although the notion of its personality was not fully developed. In Norman England and on the Continent in medieval times, municipal and ecclesiastical corporations were common. In the overseas trade expansion of the 16th and 17th cent, associates bought shares in a ship, or its cargo, and divided the profits while spreading the risk. The Muscovy Company (chartered 1555) and the Dutch East India Company (chartered 1602) were perhaps the earliest trading companies with what came later to be called permanent capital. The initial British colonization of America and the appropriation of India were basically achieved through the use of government-chartered trading corporations. The failure of the MISSISSIPPI SCHEME and the SOUTH SEA BUBBLE, both in 1720, led to reforms and stricter fiscal regulation of corporations. New corporations were created in the Industrial Revolution to finance larger economic units, such as railways and steam-driven machinery in factories. Until 1844 incorporation in England continued to be a matter of special grant by the king or Parliament. In general, the history of corporations in America has been marked by the abdication of state control over corporations. The modern con-

cept of corporate power is that the rights of the participants as well as the conduct of the enterprise must be the subject of managerial discretion. The salient characteristic of the modern corporation is the separation of management from ownership. In the United States the state legislatures became the chief authorities to grant charters to corporations, although the Federal government incorporates in a limited field. Federal charters were granted to both of the Banks of the United States, to certain railroads after the Civil War, and to the Communications Satellite Corporation (Comsat). Corporations owned by the Federal government and financed by government appropriations include the Federal Deposit Insurance Corporation, the Community Credit Corporation, and various corporations established to meet emergencies and later liquidated. At first states passed a special act for each incorporation, but in 1811, New York state enacted a general incorporation law enabling the secretary of state to give charters. Since the DARTMOUTH COLLEGE CASE of 1819, when a charter was held to be a binding contract between a state and a corporation, unalterable and unamendable by the state without the corporation's consent, fewer perpetual charters have been granted, the right of the legislature to alter or annul being specifically reserved in the charter. Variability in state incorporation laws and the ability of corporations incorporated in one state to do business in all other states have allowed corporations to incorporate in the state or states having the most lenient incorporation laws—formerly New Jersey but, since 1913, Delaware, Maryland, and Maine. A more recent type of corporation is the holding company, organized to buy a controlling interest in other corporations. The amount of cash needed to control a concern is lessened by pyramiding holding companies. This is done by creating a company to hold a voting control of one or more operating companies. A third company is created to hold a controlling interest in the second, and so on. The control of the last holding company is sufficient to control all, and such control, because of the scattering of stock among many small holders, may need the ownership of only 10% or 20% of the stock available. The large business corporation has strongly influenced the control of property in the modern world. Approximately 100 corporations are thought to own half of the total corporate wealth of the United States; they are typically controlled by a small minority of the stockholders. There are several methods employed by small groups of stockholders to gain control of large corporations. These include pooling of the majority of stock in the hands of trustees having the power to vote it and the use of proxies (agents for the actual stockholders pledged to vote for particular candidates for managerial positions). Proxies are generally successfully used because stockholders rarely attend meetings or name proxies other than those suggested to them by management. See also TRUST. See A. A. Berle and G. C. Means, *The Modern Corporation and Private Property* (1932, rev. ed. 1968); E. S. Mason, ed., *The Corporation in Modern Society* (1960, repr. 1966); W. L. Warner, *The Corporation in the Emergent American Society* (1962); P. F. Drucker, *The Concept of the Corporation* (rev. ed. 1972); Herman Kahn, ed., *The Future of the Corporation* (1974).

corporation tax, imposts levied by federal, state, or local governments against corporations, their income, or their peculiar attributes, such as charters, capitalization, dividends, and franchises. In the United States such taxes were brought about by the difficulty of taxing corporate bonds and stocks and by the growth of corporations beyond state bounds, with consequent difficulty of assessment and taxation. Such special state corporation taxes now include fees and licenses for incorporation or for an increase in capitalization or for filing the corporation's charter in another state, taxes on gross earnings, taxes on tonnage and financial instruments or transactions, franchise taxes, capital stock taxes, and net income taxes. In 1909 the Federal government imposed an excise tax on net incomes of U.S. corporations. That tax was superseded by a corporation INCOME TAX after the Sixteenth Amendment (1913). In Great Britain in 1920 a tax was levied on corporations, including foreign companies of limited liability doing business in the United Kingdom, but exempting the profits of corporations receiving income from other corporations already taxed. In both the United States and Great Britain, EXCESS PROFITS TAX has generally been imposed only during wartime. See Sean Reamonn, *The Philosophy of the Corporate Tax* (1970); B. I. Brittker, *Federal Income Taxation of Corporations and Shareholders* (3d ed.

1971); Hugo Nurnburg, *Cash Movements Analysis of the Accounting for Corporate Income Taxes* (1971). **corporative state**, economic system inaugurated by the Fascist regime of Benito Mussolini in Italy. It was adapted in modified form under other European dictatorships, among them Adolf Hitler's National Socialist regime in Germany and the Spanish regime of Francisco Franco. Although the Italian system was based upon unlimited government control of economic life, it still preserved the framework of capitalism. Legislation of 1926 and later years set up 22 guilds, or associations, of employees and employers to administer various sectors of the national economy. These were represented in the national council of corporations. The corporations were generally weighted by the state in favor of the wealthy classes, and they served to combat socialism and syndicalism by absorbing the trade union movement. The Italian corporative state aimed in general at reduced consumption in the interest of militarization. See Roland Sarti, *Fascism and the Industrial Leadership in Italy, 1919-1940* (1971).

corpulent, see SAINT ELMO'S FIRE.

corpus callosum, see BRAIN.

Corpus Christi (kōr'pəs krīs'tē), city (1970 pop. 204,525), seat of Nueces co., S Texas, inc. 1852. It is a busy port of entry on Corpus Christi Bay at the entrance to Nueces Bay (an inlet at the mouth of the Nueces River), the main cargoes handled are cotton, oil, grain, and chemicals. The city is a petroleum and natural gas center, with much heavy industry. It has oil refineries, smelting plants, chemical works, and food-processing establishments, as well as a large shrimp fleet and an important fishing industry. Excellent sports-fishing facilities, beaches, and a mild climate make Corpus Christi a well-known tourist center. It is the gateway to Padre Island National Seashore. Tradition holds that the bay was named by the Spanish explorer Alonzo Alvarez de Pineda who discovered it on Corpus Christi Day in 1519, but there is evidence that it was named instead by the first settlers, who arrived from the lower Rio Grande valley in the 1760s. In 1839, Col. H. L. Kinney founded a trading post there, and traders, adventurers, and ne'er-do-wells collected in a raffish colony on land claimed by both Texas and Mexico. The small port and terminus for overland wagon-train traffic boomed during the Mexican War. It was briefly captured by the U.S. navy in the Civil War and later served as a supply and shipping point for sheep and cattle. It developed industrially after the discovery of oil in the area and the completion (1926) of a deepwater channel past Mustang Island. Its remarkable growth is evidenced by a spectacular bridge (235 ft/72 m high, completed 1959) over the harbor entrance and by a large dam on the Nueces River that has increased the city's water supply. The city has many historical points of interest and is the seat of a junior college and of the Univ. of Corpus Christi. A huge naval air-training station, also containing a major U.S. army helicopter maintenance facility, is on the southern shore of the bay. The city has suffered from occasional hurricanes; it is now partially protected from flooding by a sea wall 12,300 ft (3,749 m) long, built between 1939 and 1941 to a height 14 ft (4 m) beyond the high-water mark of a devastating 1919 hurricane.

Corpus Christi [Latin, = body of Christ], feast of the Western Church, observed on the Thursday after Trinity Sunday (or on the following Sunday). It commemorates the founding of the sacrament of the Eucharist, supplementing the anniversary on MAUNDY THURSDAY. The feast was established generally in 1264, with an office by St. Thomas Aquinas, which includes the splendid hymn PANGE LINGUA. In medieval times it was celebrated with pageants and the performance of MIRACLE PLAYS.

Corpus Juris Civilis (kōr'pəs jōō'rīs sīv'īlīs), most comprehensive code of ROMAN LAW and the basic document of all modern CIVIL LAW. Compiled by order of Byzantine Emperor Justinian I, the first three parts appeared between 529 and 535 and were the work of a commission of 17 jurists presided over by the eminent jurist Tribonian. The *Corpus Juris* was an attempt to systematize Roman law, to reduce it to order after over 1,000 years of development. The resulting work was more comprehensive, systematic, and thorough than any previous work of that nature, including the THEODOSIAN CODE. The four parts of the *Corpus Juris* are the Institutes, a general introduction to the work and a general survey of the whole field of Roman law, the Digest or Pandects, by far the most important part, intended for practitioners and judges and containing the law in concrete form plus selections from 39 noted classical

jurists such as Gaius, Paulus, Ulpian, Modestinus, and Papinian, the *Codex* or *Code*, a collection of imperial legislation since the time of Hadrian, and the *Novels* or *Novellae*, compilations of later imperial legislation issued between 535 and 565 but never officially collected. Because it was published in numerous editions, copies of this written body of Roman law survived the collapse of the Roman empire and avoided the fate of earlier legal texts—notably those of the great Roman jurist Gaius. With the revival of interest in Roman law (especially at Bologna) in the 11th cent., the *Corpus Juris* was studied and commented on exhaustively by such scholars as IRRERIUS. Jurists and scholars trained in this Roman law played a leading role in the creation of national legal systems throughout Europe, and the *Corpus Juris Civilis* thus became the ultimate model and inspiration for the legal system of virtually every continental European nation. The name *Corpus Juris Civilis* was first applied to the collection by the 16th-century jurist Denys Godefroi. See H. F. Jolowicz, *Historical Introduction to the Study of Roman Law* (2d ed. 1952) and *Roman Foundations of Modern Law* (1957), A. T. Von Mehren, *The Civil Law System* (1957).

Correggio (kärē'ō), c. 1494–1534, Italian painter, whose real name was Antonio Allegri, called Correggio for his birthplace. He learned the rudiments of art from his uncle Lorenzo Allegri. His early works were greatly influenced by the divergent styles of Mantegna and Leonardo da Vinci, as evidenced in the *Marriage of St. Catherine* (National Gall. of Art, Washington, D.C.) and *Madonna of St. Francis* (Dresden). Correggio's first important commission (1518) was the decoration of the convent of San Paolo at Parma. He handled the erudite allegorical program with exuberance. Depicting an impressive array of gods in the lunettes, he added a group of capricious putti (male infants) to the dome. Correggio painted many other mythological scenes including the sensual *Jo* (Vienna), *Danae* (Borghese Gall., Rome), and *Antiope* (Louvre). In 1520 he began to fresco the dome of St. John the Evangelist, Parma, with the *Ascension of Christ*. A few years later he was working on his most famous project, *Assumption of the Virgin*, in the dome of the cathedral in Parma. The Virgin is encircled by an elaborate network of apostles, patriarchs, and saints, all emerging from the clouds. Correggio used daring foreshortening in his execution of the figures. His illusionistic ceiling decorations were widely imitated in the 17th cent. Pervaded by a sense of grace and tenderness, his paintings are characterized by their soft play of light and color. Other famous works are *Madonna of St. Jerome* (Parma), *Adoration of the Child* (Uffizi), and *Madonna and Saints* (Philadelphia Mus.). See his frescoes, ed. by A. Q. Ghidiglia (1964), biography by C. Ricci (1930), studies by A. E. Popham (1957) and E. Panofsky (1961).

Correggio (kōr-rēd'jō), town (1971 pop. 20,301), in Emilia-Romagna, N. central Italy. It is an agricultural market and a cheese-manufacturing center. It was the seat of a small principality of the Da Correggio family (12th–17th cent.), whose palace is a good example of 16th-century architecture. The painter Antonio Allegri was born there (1494) and was called Correggio after the town.

Corregidor (kärē'gīdōr'), historic fortified island (c. 2 sq mi/5 sq km), at the entrance to Manila Bay, just off Bataan peninsula of Luzon island, the Philippines. From the days of the Spanish, Corregidor and its tiny neighboring islets—El Fraile, Caballo, and Carabao—guarded the entrance to Manila Bay, serving as an outpost for the defense of Manila. The Spanish also maintained a penal colony on Corregidor. When the Americans acquired the Philippine Islands after the Spanish-American War (1898), they elaborately strengthened those defenses. Corregidor was honeycombed with tunnels to serve as ammunition depots, and Fort Mills and Kindley Field were established. Fort Drum was built on El Fraile, Fort Hughes on Caballo, and Fort Frank on Carabao. The new fortifications were deemed so formidable that Corregidor became known as the Gibraltar of the East, or "the Rock." In the early phase of World War II, Corregidor's batteries guarded the entrance to Manila Bay—denying that splendid harbor to the Japanese for five months—and protected the flank of the large U.S.-Filipino army concentrated on Bataan peninsula. During those months Corregidor was subjected to one of the most intense continuous bombardments of the entire war. Its surface was churned to rubble, and the garrison was forced into the caves and tunnels. After the fall of Bataan, about 10,000 U.S. and Filipino troops under Lt. Gen. Jona-

than M. Wainwright fought gallantly on for a month. They were hopelessly cut off from all supplies and aid. Corregidor was finally invaded early in May, 1942, and the garrison was forced to surrender. The island was recaptured in March, 1945, by U.S. paratroopers and shore landing parties. It is now a national shrine. See James and William Belote, *Corregidor: The Saga of a Fortress* (1967).

correspondence principle, physical principle, enunciated by Niels Bohr in 1923, according to which the predictions of the QUANTUM THEORY must correspond to the predictions of the classical theories of physics when the quantum theory is used to describe the behavior of systems that can be successfully described by classical theories. Technically this principle means that the results of a quantum theory analysis of a problem that involves the use of very large quantum numbers must agree with the results of a classical physics analysis. Such correspondence is known as the classical limit of the quantum theory. Ordinarily the quantum theory is used to describe the behavior of bodies that are so small that they cannot be seen under an optical microscope, while the theories of classical physics are used to analyze the behavior of large-scale bodies. The correspondence principle provided an important theoretical basis for the development of a detailed correlation between the newer quantum theory and the classical physics that preceded it.

Corrèze (kōrēz'), department (1968 pop. 237,858), S. central France, in LIMOUSIN. TULLE is the capital.

Corrib, Lough (lōkh kōr'ib), lake, 68 sq mi (176 sq km), Counties Galway and Mayo, W. Republic of Ireland. The irregularly shaped lake, which is 27 mi (43 km) long, drains into Galway Bay through the Corrib River. It is connected by a partly subterranean channel with Lough Mask to the north. Lough Corrib is an important transportation route, it is also a major brown-trout fishery.

Corrientes, city (1970 pop. 137,823), capital of Corrientes prov., NE Argentina, a port on the Paraná River. It is the commercial center of a rich pastoral and agricultural region. The city exports the cattle, timber, and agricultural products of the province. An important cultural center, it has several institutions of higher education, museums, and historical monuments. Corrientes was founded in 1588 and survived fierce Indian attacks during the late 16th and early 17th cent. In 1762 an uprising of the *comuneros* [townspeople] against the colonial governor foreshadowed the wars of independence from Spain. The city and province were among the first to rebel (1844) against Juan Manuel de Rosas.

Corrievekin or Corryveckan (both kōr'ēvrēkən), whirlpool in Corrievekin passage N. of Jura island, Argyllshire, W. Scotland.

corrosion, atmospheric oxidation of metals (see OXIDATION AND REDUCTION). By far the most important form of corrosion is the rusting of IRON. Rusting is essentially a process of oxidation in which iron combines with water and oxygen to form rust, the reddish-brown crust that forms on the surface of the iron. Rust, a chemical compound, is a hydrated ferric oxide $\text{Fe}_2\text{O}_3 \cdot n\text{H}_2\text{O}$, where n is usually $1\frac{1}{2}$. The chemical mechanism of rusting is not fully known, but is thought to involve oxidation of metallic iron to ferrous ion (Fe^{++}) and reaction of the ferrous ion with oxygen and water to form rust. The reaction is catalyzed by water, acids, and metals (e.g., copper and tin) below iron in the ELECTROMOTIVE SERIES. Because iron is so widely used, e.g., in building construction and in tools, its protection against rusting is important. Although metals (e.g., aluminum, chromium, and zinc) above iron in the electromotive series corrode more readily than iron, their oxides form a tenuous coating that protects the metal from further attack. Rust is brittle and flakes off the surface of the iron, continually exposing a fresh surface. Rusting can be prevented by excluding air and water from the iron surface, e.g., by painting, oiling, or greasing, or by plating the iron with a protective coating of another metal. Metals used for plating include chromium, nickel, tin, and zinc. Zinc plating is called galvanizing. Many alloys of iron are resistant to corrosion. Stainless steels are alloys of iron with such metals as chromium and nickel; they do not corrode because the added metals help form a hard, adherent oxide coating that resists further attack. The iron hulls of ships can be protected against rusting by attaching magnesium strips to the underside of the vessel. An electric current is generated, with the magnesium and iron acting as electrodes and seawater acting as the electrolyte. Because magnesium is above iron in the electromotive series, it serves as a "sacrificial anode" and is oxidized in

preference to the iron. This is called cathodic protection, since the iron serves as the cathode and thus escapes oxidation. This method is also used to protect the pipes of electric generating plants where salt water is used as a coolant.

corrosive sublimate: see MERCURIC CHLORIDE

corrupt practices, in politics, fraud connected with elections. The term also refers to various offenses by public officials, including bribery, the sale of offices, granting of public contracts to favored firms or individuals, and granting of land or franchises in return for monetary rewards. Election fraud may consist of efforts to influence or intimidate the voter or to tamper with the official BALLOT or election count. To eliminate these practices nearly all democratic nations have passed laws that attempt to safeguard the honesty of political campaigns and elections. In Great Britain the Acts of 1883 and 1918, frequently amended, define election abuses and limit political spending by or on behalf of candidates for Parliament. In the United States individual states have their own election laws, and they preceded Congress in enacting corrupt practices acts. In large cities of the United States election fraud has historically been associated with political machines (see BOSSISM), while in the S. United States it was historically used to deprive the Negro of political power. On the Federal level, the Corrupt Practices Act of 1925, the Hatch Act of 1940, parts of the Taft-Hartley Act of 1947, and the campaign financing legislation of 1974 have all tried to regulate campaign finances by limiting amounts spent and the size and source of campaign gifts, by requiring disclosure of expenditure, and by public financing of presidential elections. In 1968, in the wake of several scandals, both the Senate and the House established ethics committees and adopted codes of conduct that required members to file reports on their income and campaign contributions. In 1972, Congress passed legislation limiting the amount of money presidential and congressional candidates could spend in their campaigns, the law also required that all contributions and expenditures exceeding \$100 be publicly reported. Revelations of political sabotage and espionage financed through secret campaign funds during the 1972 presidential election (see WATERGATE AFFAIR) led to renewed efforts on the state and Federal levels to regulate campaign finances. The most immediate result was the 1974 law limiting the amount that can be spent in campaigns and providing for a measure of public financing of national elections. The term has also been applied to businesses and labor unions, in the former case for price fixing, and in the latter for misappropriation of funds or the rigging of union elections. See Alexander Heard, *The Cost of Democracy* (1960, repr. 1967), H. E. Alexander, *Regulation of Political Finance* (1966) and *Money in Politics* (1972), E. M. Epstein, *Corporations, Contributions, and Political Campaigns* (1968), George Thayer, *Who Shakes the Money Tree? American Campaign Financing Practices from 1789 to the Present* (1973).

Corryveckan, whirlpool see CORRIEVEKIN, Scotland.

corsair: see PIRACY

corset, article of dress designed to support or modify the figure. Greek and Roman women sometimes wrapped broad bands about the body. In the Middle Ages a short, close-fitting, laced outer bodice or waist was worn. By the 16th cent. it had become a tight inner bodice, sometimes of leather, stiffened with whalebone, wooden splints, or steel, fashion demanded the slenderest possible waist in contrast with the enormous farthingales and stuffed breeches that were worn. Stays and tight lacing were made for both men and women from the 17th through the 19th cent., except for a brief period following the French Revolution. By 1900 the corset had become primarily a female garment, and it was gradually modified to conform to the natural lines of the body. Today the garment that most closely resembles the corset is termed a girdle.

Corsica (kōr'sīka), Fr. Corse, island (1968 pop. 269,831), 3,367 sq mi (8,721 sq km), a department of metropolitan France, SE of France and N of Sardinia, in the Mediterranean Sea. AJACCIO, the capital, and BASTIA are the chief towns and ports. The island is largely mountainous, culminating in Monte Cinto (8,891 ft/2,710 m). Principal rivers are the Golo, Tavignano, Liamone, Gravone, Tarova, and Profiano. Olive oil, wine, and timber are the main exports. Much wheat and cheese are produced, and sheep are raised. Communications are poor. Much of the island is wild, covered by undergrowth, or maquis, the flowers of the maquis produce a fragrance that

carries far out to sea and has earned for Corsica the name "the scented isle." The maquis long provided ideal hideouts for bandits, and banditry was not fully suppressed until the 1930s. Blood feuds between clans also persisted into modern times. Most Corsicans speak a dialect akin to Italian. After having belonged to the Romans (3d cent B C–5th cent A D), the Vandals, the Byzantines, and the Lombards, the island was granted (late 8th cent.) by the Franks to the papacy. It was threatened by the Arabs from c. 800 to 1100. In 1077, Pope Gregory VII ceded Corsica to Pisa. Pisa and Genoa and later Genoa and Aragon battled for Corsica. In the mid-15th cent. the actual administration of the island was taken up by the Bank of San Giorgio in Genoa. Genoese rule was harsh and unpopular. Later unrest was typified by the episode of "King" Theodore I (see NEUHOF, THEODOR, BARON VON). In 1755, Pasquale PAOLI headed a rebellion against Genoa, but its success resulted only in the cession (1768) of Corsica to France. One consequence of the transfer was the French citizenship of Napoleon I, who was born in 1769 at Ajaccio. With British support PAOLI expelled the French in 1793, and in 1794 Corsica voted its union with the British crown. The French (under Napoleon) recovered it, however, in 1796, and French possession was guaranteed at the Congress of Vienna (1815). French rule brought education and relative order, but economic life remained agrarian and primitive. In World War II, Corsica was occupied by Italian and German troops. Late in 1943 the population revolted, and, with the assistance of a Free French task force, the Axis forces were driven out. A postwar exodus of population caused the French government to announce a program of economic development in the 1950s. The island has developed a tourist industry. In 1958 a right-wing coup similar to that in Algiers contributed to the return to power of Charles de Gaulle in France.

Corsicana (kōrsīkā'nə), city (1970 pop. 19,972), seat of Navarro co., E central Texas, inc. 1848. It is an oil center with wells and refineries and additional industries that depend on the cotton, small grains, and Hereford cattle produced in the surrounding blackland farm area. The discovery of oil when a city water well was being dug (1894) caused dismay at first but led to the drilling (1895) of the first commercial oil well W of the Mississippi and the building (1898) of the first refinery in Texas. In Corsicana are a junior college and Pioneer Village, a complex of restored log structures.

Cort, Henry, 1740–1800, English inventor. He revolutionized the British iron industry with his use of grooved rollers to finish iron, replacing the process of hammering, and through his invention of the puddling process. This process involved stirring the molten pig iron in a reverberatory furnace until the decarburizing action of the air produced a loop of pure metal.

Cortazar, Julio (hōō'lyō kōr'ta'zar), 1914–, Argentine novelist, poet, essayist, and short-story writer, b. Brussels. A student of SURREALISM, he creates a cruel and despairing world full of fantasy and satire. Life is often depicted as a maze or game from which man must extricate himself. His works include *Final del juego* (1956, tr. *End of the Game*, 1967), *Historias de cronopios y de famas* (1962, tr. *Cronopios and Famas*, 1969), *Rayuela* (1963, tr. *Hopscotch*, 1966), *Sixty-two*, *A Model Kit* (1972, tr. 1972), and *All Fires the Fire and Other Stories* (tr. 1973).

Cortelyou, George Bruce (kōr'talyōō), 1862–1940, American public official and business executive, b. New York City. He taught school, and after learning stenography, he became secretary to several New York City and Federal officials. Appointed (1895) stenographer to President Cleveland, Cortelyou became secretary to Presidents McKinley (1900) and Theodore Roosevelt (1901). He also served under Roosevelt as Secretary of Commerce and Labor (1903–4), Postmaster General (1905–7), and Secretary of the Treasury (1907–9). He then left government service and became prominent as an executive of public-utility companies.

Corte Real or Corte-Real, Gaspar (gashpar' kōr'ta réal'), c. 1450–1501?, Portuguese explorer. Sent by King Manuel I to search for the Northwest Passage, he is said to have discovered Greenland in 1500 and may have touched on the North American coast. He made a second voyage with his brother Miguel in 1501. He then sent Miguel home and continued his exploration, sailing southwest along the present U.S. coast. Gaspar Corte Real was lost. In 1502 Miguel Corte Real went in search of him but was also lost. The brothers certainly reached Newfoundland and made sweeping discoveries, but the results were in-

conclusive. See H. P. Biggar, *Voyages of the Cabots and the Corte-Reals* (1903).

Cortes, Hernan, or Hernando Cortez (kōrtēz', Span. ārnan', ārnan'dō kōrtās'), 1485–1547, Spanish CONQUISTADOR, conqueror of Mexico. He went to Hispaniola (1504) and later (1511) accompanied Diego de VELAZQUEZ to Cuba. In 1518 he was chosen to lead an expedition to Mexico. Although Velazquez later sought to recall his commission, Cortes sailed in Feb., 1519. In Yucatan he rescued a Spaniard who had learned the Mayan language, after a victory over Indians in Tabasco, Cortes acquired the services of a female slave Malinche—baptized Marina—who knew both Maya and Aztec. Having proceeded up the coast, Cortes founded Villa Rica de la Vera Cruz and was chosen captain general by the cabildo, thus he discarded Velazquez's authority and became responsible only to Charles V. Cortés, learning that the Aztec empire of MONTUZUMA was honeycombed with dissension, assumed the role of deliverer and rallied the coastal Totonacs to his standard, he also began negotiations with Montezuma. Scuttling his ships to prevent the return of any Velazquez sympathizers to Cuba, he began his famous march to Tenochtitlan (modern Mexico city), capital of the Aztec empire. He defeated the Tlaxcalan warriors, then formed an alliance with the so-called republic of Tlaxcala, practically destroyed CHOLULA, and arrived at Tenochtitlan in Nov., 1519. There the superstitious Montezuma received the Spanish as descendants of the god Quetzalcoatl. Cortes seized his opportunity, took Montezuma as a hostage, and attempted to govern through him. In the spring of 1520, Cortes went to the coast, where he defeated a force under Panfilo de NARVAEZ. Pedro de ALVARADO, left in command, impetuously massacred many Aztecs, and soon after Cortes's return the Aztecs besieged the Spanish. In the ensuing battle, Montezuma was killed. The Spanish, seeking safety in flight, fought their way out of the city with heavy loss on the *noche triste* [sad night] (June 30, 1520). Still in retreat, they defeated an Aztec army at Otumba and retired to Tlaxcala. The next year Cortes attacked the capital, and after a three-month siege Tenochtitlan fell (Aug. 13, 1521). With it fell the Aztec empire. As captain general, Cortes extended the conquest by sending expeditions over most of Mexico and into N. Central America. In 1524–26, Cortes himself went to Honduras, killing CUAUHTÉMOC, the Aztec emperor, on the expedition. In Cortes's absence his enemies gradually triumphed, and after his return his power was made more fictitious than real by the audiencia. Although on his visit to Spain (1528–30) Cortes was made marqués del Valle de Oaxaca, Charles V. refused to name him governor. Returning to Mexico, he vainly sent out maritime expeditions, frustrated more than once by Nuño de GUZMAN. Subsequently he quarreled with the viceroy, Antonio de MENDOZA, and in 1540 he again sought justice in Spain. There, neglected by the court, he died. The best-known contemporary account of the conquest is that of Bernal Díaz del Castillo. See the letters of Cortes (Eng. ed. by F. A. MacNutt, 1908), W. H. Prescott, *Conquest of Mexico* (1937), studies by Salvador de Madariaga (1942, repr. 1969) and H. R. Wagner (1944, repr. 1969).

Cortes (kōrtēz, Span. kōrtās), representative assembly in Spain. The institution originated (12th–13th cent.) in various Spanish regions with the Christian reconquest, until the 19th cent. the local cortes of Leon, Castile, Aragon, Catalonia, Navarre, Valencia, and other states met separately. The three estates—clergy, nobility, and burghers—voted the taxes, recognized the kings upon their accession, and indirectly exercised some legislative influence. The cortes of Aragon and Catalonia were particularly powerful. After the consolidation of the royal power (15th cent.) and the unification of Spain, the cortes were seldom convoked except to pay homage, and their powers were curtailed. The first national Cortes of Spain met at Cadiz in 1810 in the Peninsular War, the Spanish war of liberation from Napoleonic rule. They voted (1812) a liberal constitution, later (1814) revoked by Ferdinand VII. Thereafter the status of the Cortes frequently changed in its struggle for power with the king. At the fall of the monarchy in 1931, a constituent Cortes promulgated a republican constitution, and the Cortes was the parliament of Spain until 1939. Under Francisco Franco's dictatorship a Cortes was preserved but stripped of effective legislative power. Under the Portuguese monarchy various legislative bodies were known as cortes.

cortex, in botany, term generally applied to the soft tissues of the leaves, stems, and roots of plants. Cortical cells of the leaves and outer layers of the stems

of nonwoody plants contain chloroplasts, and are modified for food storage (usually in the form of starch) in roots and the inner layers of stems and seeds. Because of the combination of its soft texture (especially after cooking) and its role as a food storage tissue, the cortex is the predominant plant tissue eaten by man and other animals.

Cortez, Hernando. see CORTÉS, HERNAN

corticosteroid drug (kōr'təkōstēr'oid), any one of several synthetic or naturally occurring substances with the general chemical structure of STEROIDS. They are used therapeutically to mimic or augment the effects of the naturally occurring corticosteroids, which are produced in the cortex of the ADRENAL GLAND. Corticosteroids are very powerful drugs affecting the entire system, even corticosteroids used on large areas of skin for long periods are absorbed in sufficient quantity to cause systemic effects. Corticosteroids, as well as ADRENOCORTICOTROPIC HORMONE (ACTH), the pituitary gland substance that stimulates the adrenal cortex, have modifying effects on many diseases. Some corticosteroid derivatives mimic the action of the naturally occurring steroid hormone ALDOSTERONE, causing increased sodium retention and potassium excretion. Others have the same effects as the naturally occurring steroids CORTISONE and CORTISOL, which are classed as glucocorticoids, these affect carbohydrate and fat metabolism, reduce tissue inflammation, and suppress the body's immune defense mechanisms. Cortisone and hydrocortisone are used to treat ADDISON'S DISEASE, a disorder caused by underproduction of the adrenal cortex hormones. These and synthetic steroids are extensively used to treat arthritis and other rheumatoid diseases including rheumatic heart disease. They are also used in some cases of autoimmune diseases such as systemic lupus erythematosus, in severe allergic conditions such as asthma, in allergic and inflammatory eye disorders, in some respiratory diseases, and in some leukemias and cancers. The anti-inflammatory, itch-suppressing, and vasoconstrictive properties of steroids make them useful when applied to the skin to relieve diseases such as eczema, psoriasis, and insect bites. Because corticosteroids lower the resistance to infection, patients on steroid therapy cannot be vaccinated for smallpox or immunized. The administration of corticosteroids also causes underproduction of the natural hormones by the adrenal cortex, and so ACTH or corticosteroid therapy must always be withdrawn gradually. In addition, when used in large doses for long periods of time, the drugs can cause atrophy of the adrenal cortex. Side effects of steroid therapy include glaucoma, excess hair growth, and imbalance of many substances, including calcium, nitrogen, potassium, and sodium. Many of the synthetic corticosteroids, such as prednisone, prednisolone, triamcinolone, and beta methasone, are more potent than the naturally occurring compounds.

corticosterone (kōr'təkōstēr'ōn), steroid HORMONE secreted by the outer layer, or cortex, of the ADRENAL GLAND. Classed as a glucocorticoid, corticosterone helps regulate the conversion of amino acids into carbohydrates and glycogen by the liver, and helps stimulate glycogen formation in the tissues. Corticosterone is similar in structure, although somewhat less potent, than the other glucocorticoids CORTISOL and CORTISONE. It is produced in response to stimulation by the pituitary substance ADRENOCORTICOTROPIC HORMONE (ACTH). In some species, but not in humans, corticosterone is the predominant glucocorticoid secreted by the adrenal. It is a precursor in the synthesis of ALDOSTERONE, another adrenal cortical steroid.

corticotropin (kōr'təkōtrōp'ən) see ADRENOCORTICOTROPIC HORMONE

Cortina d'Ampezzo (kōrtē'na dampēd'zō), town (1971 pop. 8,574), in Venetia, NE Italy, in the heart of the DOLOMITES. It is an international winter sports center. The 1956 winter Olympic games were held there.

cortisol (kōr'tīsōl'), or hydrocortisone, steroid HORMONE that in humans is the major circulating hormone of the cortex, or outer layer, of the ADRENAL GLAND. Like CORTISONE, cortisol is classed as a glucocorticoid, it stimulates liver glycogen formation while it decreases the rate of glucose utilization in body cells. A main effect of cortisol is to reduce the reserves of protein in all body cells except cells of the liver and gastrointestinal tract. It also makes fatty acids available for metabolic use. Cortisol is synthesized and secreted by the adrenal cortex in response to the stimulating substance ADRENOCORTICOTROPIC HORMONE (ACTH). In turn, cortisol is the major regu-

lator of ACTH production in the pituitary gland, it acts by negative feedback inhibition, i.e., a rise in the level of cortisol in the blood inhibits ACTH secretion by the pituitary. Cortisol is more potent than cortisone with respect to metabolic and anti-inflammatory effects.

cortisone (kôr'tisôn'), steroid HORMONE whose main physiological effect is on carbohydrate metabolism. It is synthesized from CHOLESTEROL in the outer layer, or cortex, of the ADRENAL GLAND under the stimulation of ADRENOCORTICOTROPIC HORMONE (ACTH). Cortisone is classed as a glucocorticoid with CORTISOL and CORTICOSTERONE, its effects include increased glucose release from the liver, increased liver glycogen synthesis, and decreased utilization of glucose by the tissues. These actions tend to counter the effects of INSULIN and may aggravate or mimic diabetes in sufficiently high doses. Cortisone also exerts an effect on salt retention in the kidneys similar to that of ALDOSTERONE, although it is not as potent. The hormone causes increased breakdown of proteins and decreased protein synthesis, and large doses given over a long period of time may result in inhibited growth in children or weakening of bones and wasting of muscles in adults. The principal medical use of cortisone comes from its anti-inflammatory and anti-allergic effects, it is extremely useful in the treatment of innumerable diseases including asthma and other allergic reactions, arthritis, and various skin diseases. Cortisone is necessary to maintain life and enable the organism to respond to stress, failure of the adrenal glands to synthesize cortisone (Addison's disease) or surgical removal of the adrenals is fatal unless cortisone is given as replacement therapy. Although less cortisone is manufactured in the body than either cortisol or corticosterone and although cortisone is less potent than cortisol, the term cortisone is often used collectively to include the other glucocorticoids, both the naturally occurring and the synthetic compounds such as prednisone. Small quantities of cortisone were first isolated from animal adrenals in 1935-36. A method of manufacture, involving laboratory synthesis from an acid of BILE, was developed, and in 1949 cortisone was first offered commercially. The specific mechanisms by which cortisone and similar compounds act are still poorly understood.

Cortisoz, Royal (kôr'tē'sōz), 1869-1948, American critic and lecturer on art. He was the New York *Herald Tribune* art critic from 1891 and was noted for his lectures at the Metropolitan Museum and at other museums throughout the United States. He wrote biographies of Augustus Saint-Gaudens (1907), John La Farge (1911), and Whitelaw Reid (1921), as well as *Art and Common Sense* (1913), *American Artists* (1923), *Personalities in Art* (1925), and *The Painter's Craft* (1930).

Cortland, city (1970 pop. 19,621), seat of Cortland co., central N.Y., in a fertile farm area, settled 1791, inc. as a city 1900. Fish line, metal products, and automotive and aircraft parts are among the manufactures. The State Univ. College at Cortland is a major employer, and a junior college is in nearby Groton.

Cortona, Pietro Berrettini da (pyä'trô bär-rêt-tē'nē dā kôrtô'nä), 1596-1669, Italian baroque painter and architect, b. Cortona. The Barberini family commissioned him to paint frescoes for the vast ceiling of their palace in Rome, which resulted in the exuberant *Allegory of Divine Providence and Barberini Power* (1633-39). The work, filled with swirling clouds and figures, was one of the most influential of baroque decorative schemes. It is a paramount example of baroque ILLUSIONISM. In Florence he executed frescoes of the Four Ages and the rich ceiling decoration in the Pitti Palace, the *Allegories of the Virtues and Planets*. In these seven rooms the ceilings are unified with the structure of the rooms by stucco ornamentation. Pietro's pupil, *Ciro Ferri* (1634-89) completed the work in the Pitti Palace. Almost equally ornate were Pietro's early architectural designs, such as that for the church of *S. Martina e Luca* (1635-50) in Rome, which Pietro finished at his own expense. Later he turned to a greater simplification and massiveness in the *facades of Santa Maria della Pace* (1656-57) and *Santa Maria in Via Lata* (1658-62). His architectural works are among the most significant of the baroque period.

Cortona (kôrtô'nä), town (1971 pop. 22,377), Tuscany, central Italy. It is an agricultural and tourist center. One of the 12 important Etruscan cities, Cortona later (310 B.C.) united with Rome. The town passed to Florence in the early 15th cent. Landmarks include the Romanesque cathedral (remodeled dur-

ing the Renaissance), the Palazzo Pretorio (13th cent.), and the Church of San Francesco (begun 1245). The Diocesan Museum contains paintings by Luca Signorelli (who was born in Cortona), Fra Angelico, and others.

Cortot, Alfred Denis (älf'réd' dané' kôrtô'), 1877-1962, French pianist and conductor. Among his appearances as a conductor were those at Bayreuth from 1898 to 1901. He joined the faculty of the Paris Conservatory in 1907 and in 1919 founded the *École normale de Musique, Paris*. For many years he played trios with Jacques Thibaud and Pablo Casals.

Çorum (chôrôom'), city (1970 pop. 55,890), capital of Çorum prov., N central Turkey. It is the trade center for a farm region where grains, fruits, sheep, and goats are raised. The city's manufactures include copper and leather goods. Important Hittite remains have been found there.

Corumba (kôörôombä'), city (1970 pop. 81,838), Mato Grosso state, SW Brazil, on the Paraguay River. A river port and a junction point on the railroad to Bolivia, it is a trade center for a large pastoral region. Corumba exports leather and meat products and has varied light industries. Founded as a military outpost and colony in 1778, it became strategically important with the opening of the Paraguay River to international trade after the Paraguayan War (1865-70). Nearby are the buttes of Morro do Urucum, which contain vast iron and manganese deposits.

Coruña, La (lä kôroö'nyä), city (1970 pop. 189,654), capital of La Coruña prov., NW Spain, in Galicia. It is a busy Atlantic port, a distribution center for the surrounding farm area, and a summer resort spot. It has shipyards, metalworks, and an important fishing industry. La Coruña reached its height as a port and a textile center in the late Middle Ages. The *Armada* sailed from its harbor in 1588. The city was sacked by Sir Francis Drake in 1598. In the Peninsular War it was the scene of the battle (1809) in which Sir John Moore was killed. The city was a focus of antimonarchist sentiment during the 19th cent. Chief landmarks are a 13th-century church and the Roman Torre de Hercules, now a lighthouse. Glazed window balconies, or *miradores*, are characteristic of La Coruña.

corundum (kärün'däm), mineral, aluminum oxide, Al₂O₃. The clear varieties are used as gems and the opaque as ABRASIVE materials. Corundum occurs in crystals of the hexagonal system and in masses. It is transparent to opaque and has a vitreous to adamantine luster. The transparent gem varieties are colorless, pink, red, blue, green, yellow, and violet, the common varieties are blue-gray to brown. Emery is a common corundum, used as an abrasive and distinguished by its impurities of magnetite and hematite. The chief corundum gems are the RUBY (red) and the SAPPHIRE (blue). Yellow, pink, green, and white stones are also called yellow, pink, green, and white sapphires. Corundum gems are also made synthetically. The chief sources of natural corundum are Burma, Sri Lanka (formerly Ceylon), India, Thailand, Republic of South Africa, Tanzania, and the United States (North Carolina, Georgia, and Montana). Most of the emery is mined in Naxos and the other Cyclades and in Asia Minor.

Corvallis (kôrväl'is), city (1970 pop. 35,153), seat of Benton co., NW Oregon, on the Willamette River, inc. 1857. It is a food-processing hub in the heart of the fertile Willamette valley. It is also a research center, especially in forestry. Corvallis is the seat of Oregon State Univ. and the headquarters for Siuslaw National Forest. Nearby are a junior college, a state game farm, and a national wildlife refuge.

corvée (kôrvä'), under the feudal system, compulsory, unpaid labor demanded by a lord or king and the system of such labor in general. There were national and local variations, but in broad terms the corvée proper included work on the lord's portion of the manorial property and many attendant duties. Military service also came under the general terms of the corvée. The corvée included both regular and exceptional demands. "Real" corvée referred to the duties attached to the ownership or tillage of certain lands, "personal" corvée referred to the duties of specific individuals. Highly developed during the feudalization of the late Roman Empire, the corvée system was an integral part of the nonmoneyed social and economic system of the Middle Ages, but towns and all individuals who were able liberated themselves when possible by money payment instead of services. In France the royal corvée, compulsory work on public roads, was introduced in the 18th cent. Both the royal and the seigniorial corvée bore heavily and almost exclusively upon the peasants and helped cause the French Revolution. Aus-

tria abolished the last European corvée system in 1848.

corvette, small warship, classed between a frigate and a sloop-of-war. Corvettes usually were flush-decked and carried fewer than 28 guns. They were widely employed in escorting convoys and attacking merchant ships during the great naval wars of the late 18th and early 19th cent., but corvettes passed from use with the transition from sail to steam. At the beginning of World War II the term was reintroduced to designate a small vessel of about 1,000 tons displacement, armed with depth charges and a single 4-in. (10.2-cm) gun. In the early years of the war, large numbers of these vessels were employed by the British and Canadian navies as convoy escorts in the North Atlantic, later they were supplanted by the larger, faster, and better-armed frigates.

Corvinus, Matthias: see MATTHIAS CORVINUS

Corvo, Baron: see ROLFE, FREDERICK WILLIAM

Corwin, Thomas, 1794-1865, American politician, b. Bourbon co., Ky. A lawyer, he was an Ohio legislator in the 1820s, a U.S. Representative (1831-40), and governor of Ohio (1840-42). In the U.S. Senate (1845-50) Corwin, a Whig, violently opposed the Mexican War. He was Secretary of the Treasury (1850-53) under President Fillmore, and although not entirely approving of the Republican position on slavery, he reentered the House (1859-61) as a member of that party. He was minister to Mexico from 1861 to 1864. See biography by Josiah Morrow (1896).

Cory, William Johnson, 1823-92, English poet and classicist. He was assistant master at Eton from 1845 to 1872. His verse, of which *Ionica* (1858) is the best known, consists primarily of imitations and translations of the Greek and Latin poets. See his *Letters and Journals* (ed. by F. W. Cornish, 1897).

Coryate, Thomas (kôr'ēät), 1577?-1617, English traveler. Grotesque in appearance, he became part of the household of Henry, the oldest son of James I, where he was a sort of unofficial court jester. In 1608 he went on a journey that covered much of Europe and resulted in the publication of his *Crudities* (1611), a strange mixture of travel observations and poetry. In 1612 he set out again, voyaged in Asia Minor and Egypt, then back to Palestine and E to Persia and India, where he died in 1617. His letters from India were published in 1616 and 1618, some are reprinted in *Early Travels in India* (ed. by Sir William Foster, 1921). See biography by Michael Strachan (1962).

Cos, Greece: see KÓS

Cosa, Juan de la (hwän dā lä kô'sä), c. 1460-1510, Spanish navigator. He sailed with Columbus in 1492 (as pilot of the flagship *Santa Maria*) and again in 1498. After accompanying Alonso de Ojeda in 1499, he drew (1500) a world map (a manuscript copy exists in Madrid) that seems to be the first to question the identification with Asia of the new lands and to furnish evidence that the Cabots coasted farther S along the Atlantic shore than other documents reveal. In 1501 he was with BASTIDAS, and later (1504) he again explored the northern coast of South America. Securing for Ojeda a commission to colonize and explore that coast, Cosa accompanied him (1509) to the site of Cartagena and was there killed by the Indians.

Cosam (kô'säm), ancestor of St. Joseph, in Luke's genealogy. Luke 3:28.

Cosenza (kôzän'tsä), city (1971 pop. 101,908), capital of Cosenza prov., Calabria, S Italy, at the confluence of the Busento and Crati rivers. It is an agricultural and industrial center. Manufactures include textiles, furniture, and lumber. The chief city of the ancient Brutii, it was taken by the Romans in 204 B.C. According to tradition, Alaric I (c. 370-410 A.D.), the Visigothic king, was buried in the bed of the Busento at Cosenza. The city has suffered from numerous earthquakes. A castle built by Emperor Frederick II dominates the old part of the city.

Cosgrave, William Thomas (kôs'gräv), 1880-1965, Irish statesman. A member of SINN FEIN, he fought in the *Easter Rebellion of 1916* and was sentenced to life imprisonment. Freed a year later, he was elected to the British Parliament and joined in setting up the OAIL EIREANN in 1919. He became minister of local government in the revolutionary cabinet. Cosgrave supported the treaty (1921) that set up the Irish Free State (see IRELAND) and, after the deaths of Arthur Griffith and Michael Collins, he was elected president. In 1932, when the republicans won the election, Cosgrave became opposition leader. In 1944 he resigned the leadership of his Fine Gael, or United

Ireland, party. His son, **Liam Cosgrave**, 1920–, entered the Dail as a Fine Gael member in 1943 and served as minister of commerce and industry (1948–54) and of external affairs (1954–57). He became leader of the party in 1965, and in March, 1973, following the general election, he was made prime minister. In the face of continuing deterioration of the political situation in Northern Ireland, Cosgrave supported the British government in its establishment of a coalition executive there and its plans for a Council of Ireland to link the governments of the republic and the North.

Coshocton (kashōk'tan), city (1970 pop. 13,747), seat of Coshocton co., central Ohio, where the Tuscarawas and Walhonding rivers meet to form the Muskingum, inc. 1833. A warlike tribe of Delawareans had a village there of the same name, in 1764 the expedition of Col. Henry Bouquet freed a number of white prisoners and established a peace treaty. Of interest is the Roscoe Village, a restored canal town on the Ohio-Erie Canal.

Cosimo de' Medici. see **MEDICI, COSIMO DE'**

cosine, in trigonometry, relation defined in a right triangle for one of the acute angles (A) as the ratio of the length of the side adjacent to that angle (b) to the length of the hypotenuse (c), or $\cos A = b/c$. The concept may be extended to any plane triangle, in which case the Law of Cosines is found to hold: $a^2 = b^2 + c^2 - 2bc \cos A$, where a , b , and c are the lengths of the sides and A is the angle opposite side a , analogous relationships hold for angles B and C opposite sides b and c respectively. In general, the cosine function $\cos x$ may be expressed as an infinite series, $\cos x = 1 - x^2/2! + x^4/4! - x^6/6! + \dots$, where $n! = 1 \cdot 2 \cdot 3 \cdot \dots n$. See **TRIGONOMETRY**.

Cosmat work: see **MOSAIC**

cosmetics, preparations externally applied to change or enhance the beauty of skin, hair, nails, lips, and eyes. The use of body paint for ornamental and religious purposes has been common among primitive peoples from prehistoric times (see **BODY-MARKING**). Ointments, balms, powders, and hair dyes have also been used from ancient times. Many cosmetics originated in the Orient, but their ingredients and use are first recorded in Egypt; ancient tombs have yielded cosmetic jars (called kohl pots) and applicators (called cosmetic spoons). The Egyptians used kohl to darken their eyes, a crude paint was used on the face, and fingers were often dyed with henna. Greek women used charcoal pencils and rouge sticks of alkanet and coated their faces with powder, which often contained dangerous lead compounds. Beauty aids reached a peak in imperial Rome—especially chalk for the face and a rouge called fucus—and ladies required the services of slaves adept in their use. Many cosmetics survived the Middle Ages, and Crusaders brought back rare Eastern oils and perfumes. In the Renaissance, cosmetics, usually white-lead powder and vermilion, were used extravagantly. From the 17th cent. recipes and books on the toilette abounded. Professional cosmetologists began to appear, and luxurious prescriptions often included a bath in wine or milk. At its height by 1760, the use of cosmetics virtually disappeared with the advent of the French Revolution. The year 1900 saw a revival of their use, accompanied by the manufacture of beauty aids on a scientific basis in France. Since then the industry has grown to tremendous proportions with products manufactured for every conceivable use. In the United States, cosmetics intended for interstate commerce are controlled under the Federal Food, Drug, and Cosmetic Act of 1938.

cosmic rays, radiation of very high energy reaching the earth from outer space. Primary cosmic rays consist mostly of protons (nuclei of hydrogen atoms), some alpha particles (helium nuclei), and lesser amounts of nuclei of carbon, nitrogen, oxygen, and heavier atoms. These nuclei collide with nuclei in the upper atmosphere, producing secondary cosmic rays of protons, neutrons, mesons, electrons, and gamma rays of high energy, which in turn hit nuclei lower in the atmosphere to produce more particles (see **ELEMENTARY PARTICLES**). These cascade processes continue until all the energy of the primary particle is dissipated. The secondary particles shower down through the atmosphere in diminishing intensity to the earth's surface and even penetrate beneath it. The size of the shower indicates the energy of the primary ray, which may be as high as 10^{11} billion electron volts (Bev) or more, almost a billion times higher than the highest energy yet produced in a man-made particle accelerator, however, cosmic rays of lower energy predominate. Cosmic rays have long been used as a source of high-energy

particles in the study of nuclear reactions. The positron, the MUON, the PION (or pi MESON), and some of the so-called strange particles were initially discovered in studies of this radiation. Cosmic rays were first found to be of extraterrestrial origin by V. F. Hess c. 1911, they were so named in 1925 by R. A. Millikan, who did extensive research on them. Since then much more pertinent information has been collected, but the origin of cosmic rays remains unknown. It is believed that some cosmic rays are produced in solar flares, however, the majority seem to come from interstellar space, probably from within our GALAXY, the MILKY WAY system. The nature of the acceleration processes by which the primary particles achieve great velocities (very nearly the speed of light) is still highly speculative but may be uncovered in the future from information gathered from spacecraft. See J. E. Hooper and Morton Scharff, *Cosmic Radiation* (1958); B. B. Rossi, *Cosmic Rays* (1964).

cosmology, area of science that aims at a comprehensive theory of the creation, evolution, and present structure of the entire physical UNIVERSE. The earliest theories (see **PTOLEMAIC SYSTEM**) assumed that the earth was the center of the universe. With the acceptance of the heliocentric, or sun-centered, theory (see **COPERNICAN SYSTEM**), the nature and extent of the solar system began to be realized. In the 18th cent. William Herschel and other astronomers showed that the bright, nebulous band of light called the MILKY WAY is composed of a vast collection of STARS separated by enormous distances. This system of stars came to be called a galaxy and was thought to constitute the entire universe with the sun at or near its center. By studying the distribution of globular STAR CLUSTERS the American astronomer Harlow Shapley was able to give the first reliable indication of the size of the galaxy and the position of the sun within it. Modern estimates show it to have a diameter of about 100,000 LIGHT-YEARS with the sun at the edge of the disk, about 30,000 light-years from the center. During the first two decades of the 20th cent. astronomers came to realize that some of the faint hazy patches in the sky, called NEBULAE, are not within our own galaxy, but are separate galaxies at great distances from the Milky Way. After studying the red shifts (see **DOPPLER EFFECT**) in the spectral lines of the distant galaxies, the American astronomers Edwin Hubble and M. L. Humason concluded that the universe is expanding with the galaxies flying away from each other at great speeds. According to HUBBLE'S LAW, the expansion of the universe is approximately uniform. The greater the distance between any two galaxies, the greater their relative speed of separation. Today the most widely accepted picture of the universe is a system of billions of galaxies, most of them clustered in groups of hundreds or thousands, spread over a volume with a diameter of at least 10 billion light-years, and all receding from each other with the speeds of the most widely separated galaxies approaching the speed of light. On a more detailed level there is great diversity of opinion, and cosmology remains a highly speculative and controversial science. Present models of the universe hold two fundamental premises: the cosmological principle and the dominant role of GRAVITATION. The cosmological principle states that if a large enough sample of galaxies is considered, the universe looks the same from all positions and in all directions in space. The second point of agreement is that gravitation is the most important force in shaping the universe. However, on the vast scale of the entire universe, Newton's law of universal gravitation, which served science for nearly 300 years, has proved inadequate. According to Einstein's general theory of RELATIVITY, which is a geometric interpretation of gravitation, matter produces gravitational effects by actually distorting the space about it, the curvature of space is described by a form of NON-EUCLIDEAN GEOMETRY. A number of cosmological theories satisfy both the cosmological principle and general relativity. The two general types of theories are the big-bang hypothesis and the steady-state hypothesis, with many variations on each basic approach. According to big-bang theories, at the beginning of time all of the matter and energy in the universe was concentrated in a very small volume that exploded, and the resultant expansion continues today. This explosion is dated between 8 and 13 billion years ago. The original temperature of the universe was as high as 10 billion degrees, and the original composition was pure hydrogen. In the primeval fireball (the violent initial stages of expansion lasting only a few hours), some of the hydrogen was converted into helium by fusion, the relative abun-

dance of hydrogen and helium in the oldest stars is being used as a test of the theory. After many millions of years the expanding universe, at first a very hot gas, thinned and cooled enough to condense into individual galaxies and then stars. In one widely held version of the big-bang theory, the universe is oscillating. The pull of gravitation tends to slow its expansion, eventually halting and then reversing it, this leads to a collapse back to the initial, ultrahigh-density conditions followed by another explosion. According to the steady-state theories, the universe expands, but new matter is continuously created at all points in space left by the receding galaxies. The theories imply that the universe has always expanded, with no beginning or end, at a uniform rate and that it always will expand and maintain a constant density. The continuous creation of matter violates one of the central and best-established laws of physics, the conservation of energy (see **CONSERVATION LAWS**, in physics). For meeting this objection to the steady-state theory, proponents suggest that the laws of physics, which were discovered by experiments in terrestrial laboratories, may not hold true for the universe at large. They also claim that the constants of physics are not really fixed but change slowly over very long periods of time as the universe evolves. Several spectacular discoveries since 1950, owing largely to the development of RADIO ASTRONOMY, have shed new light on the problem. This branch of astronomy studies the radio waves emitted by stars and galaxies rather than their visible light. Optical and radio astronomy complemented each other in the discovery of the quasars and the radio galaxies. Quasars are starlike objects and radio galaxies are star systems, both of which radiate prodigious amounts of energy as radio waves and hence are detectable at very great distances. It is believed that the energy reaching us now from some of these objects was emitted as long as 8 billion years ago, not long after the creation of the universe, if the big-bang theory is correct. Evidence that the radio galaxies and quasars were more numerous and more intense in the remote past supports the big-bang hypothesis and makes the steady-state theory untenable in its original form. Further evidence for the big-bang theory was the discovery in the 1960s that feeble radio noise is received from every part of the sky. This background radiation has the same intensity and distribution of frequencies in all directions and thus is not associated with any individual celestial object. Rather, all space is believed to be uniformly filled with the background radiation in much the same way as an oven is filled with thermal energy (heat). The radiation filling space has a BLACK BODY temperature of three degrees above absolute zero and is interpreted as the electromagnetic remnants of the primordial fireball, stretched to long wavelengths by the expansion of the universe. However, some recent evidence may support a modified version of the steady-state cosmology. The centers of certain galaxies eject huge amounts of matter and infrared radiation in sudden bursts, this process may require new energy sources. This intense activity suggests the continuous occurrence of "little big bangs" at certain points in space, creating new galaxies that could maintain a steady-state universe. See George Gamow, *Matter, Earth and Sky* (2d ed. 1965); J. E. Chalon, *Cosmology* (tr. 1970); D. W. Sciama, *Modern Cosmology* (1971).

cosmonaut: see **ASTRONAUT**

cosmos (kōz'mos), any plant of the tropical American genus *Cosmos* of the family Compositae (COMPOSITE family). *C. bipinnatus*, of Mexico, and others are cultivated in many varieties for their showy flowers in shades of red, yellow, and white. *Cosmos* is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Asterales, family Compositae.

cosmotron: see **PARTICLE ACCELERATOR**

Cossa, Baldassarre (baldās-sār'rā kōs'sa), c. 1370–1419, Neapolitan churchman, antipope (1410–15, see **SCHISM, GREAT**) with the name John XXIII. He had a military career before entering the service of the church. He was made a cardinal by Boniface IX (1402) and proved himself able, especially in financial matters. In 1408 he deserted Gregory XII and helped to bring about the Council of Pisa (see **PISA, COUNCIL OF**) to end the schism between the Roman and the Avignon popes. The council, declaring both Gregory XII and Benedict XIII deposed, set up a third claimant, Alexander V. On Alexander's death a year later, Cardinal Cossa was elected. Of the three rival "popes," John had by far the greatest following. He immediately sought the aid of SIGISMUND and helped elect Sigismund Holy Roman emperor. John

allied himself with LOUIS II of Anjou (later king of Naples) to make war on LANCELOT of Naples and his ally Gregory XII. An ineffective council at Rome (1412-13) was followed by the Council of Constance (see CONSTANCE, COUNCIL OF), which John convened under pressure from Sigismund. At the opening of the council he reluctantly promised (1415) to abdicate if his rivals would do so. Then, surreptitiously, he fled to the lands of his ally Frederick of Hapsburg. He was forced to return. The council formally deposed him, and he submitted. He was held prisoner in Germany until released by Martin V in 1418; he returned to Italy. He died cardinal bishop of Tusculum. In his lifetime he had a reputation for unscrupulousness and self-aggrandizement.

Cossa, Francesco, or **Francesco del Cossa** (frānchēs'kō dēl kōs'sā), c 1435-1477?, Italian painter. He was a leading representative of the Ferrarese school and was regarded, with Ercole de'Roberti, as the founder of the Bolognese school. His principal works include *The Glorification of March, April, and May*, frescoes in the Schifanoia Palace, Ferrara, some admirable portraits of the artist's contemporaries, *Madonna Enthroned* (Bologna), *Madonna and Child with Angels*, *St. Liberal*, and *St. Lucy* (National Gall. of Art, Washington, D.C.), and an altarpiece representing scenes from the life of St. Vincent Ferrer (National Gall., London, and the Vatican). See Benedict Nicolson, *The Painters of Ferrara* (1950).

Cossacks (kōs'āks, -aks), Rus. *Kazaki*, Ukr. *Kozaky*, peasant-soldiers in the Ukraine and in several regions of the former Russian Empire who, until 1918, held certain privileges in return for rendering military service. The first Cossack companies were formed in the 15th cent., when the Ukraine, then part of the unified Polish-Lithuanian state, took independent measures to defend itself against the devastating Tatar raids. The Ukrainian Cossacks, of heterogeneous background, were chiefly Russians and Poles and included many runaway serfs. By the 16th cent. they had settled along the lower and middle Dnepr River (for their history to 1775, see ZAPO-ROZHYE). Similar communities grew up on the Don (see DON COSSACKS) and its tributaries. They were all organized on principles of political and social equality, and originally were virtually autonomous. Each community elected an ataman as its head, while an assembly of all the Cossacks chose the hetman. The Cossacks gave shelter to refugees from Poland and Russia and took part in peasant revolts in the Ukraine and Russia in the 17th and 18th cent. Open struggle ensued between the Cossacks and the Polish and Russian governments. By the late 18th cent. the Cossacks had lost most of their political autonomy and had been made the privileged military class, integrated with the Russian military forces. Under the last czars they were often used to quell strikes and other disturbances. The primary unit of Cossack organization, the village, was largely self-governed until 1918. Land was held in common by the village. But an 1869 law, which allowed officers and civil servants to own land as personal property, contributed to the breakup of the traditional cohesiveness of Cossack village life. In the 19th cent. the Russian government began to organize new Cossack units so that by the early 20th cent. there were 11 Cossack communities, each named for its location—Don, Kuban, Terek, Astrakhan, Ural, Orenburg, Siberia, Semirechensk, Transbaikalia, Amur, and Ussuri. Following the Bolshevik Revolution (1917), the majority of the Cossacks fought against the Soviet armies in the civil war of 1918-20. In 1920 the Soviet government abolished all their privileges and between 1928 and 1933 the Cossack communities were forcibly collectivized. In 1936, however, the Cossack party regained status, being allowed to form several cavalry divisions in the Russian army. Although the Cossack communities were incorporated into the Soviet administrative system, their traditions and customs continue to survive, notably on the Don and Kuban rivers. See studies by P. J. Huxley-Blythe (1964), Philip Longworth (1969), and V. G. Glazkov (1972).

Cossimbazar (kōsim'bāzār'), town (1971 pop. 6,306), West Bengal state, E central India. It was one of the chief overseas ports of Bengal from the 16th to the 18th cent., when Calcutta surpassed it.

Costa, Isaac da (ē'sā-āk dā kō'stā), 1798-1860, Dutch poet and historian, b. Amsterdam, of an aristocratic Sephardic Jewish family. Deeply influenced by Bilderdyk, he entered (1822) the Reformed Church, and much of his poetry is fervently Christian. Da Costa's period of poetic maturity is placed between the publication of his political poem *Vijf-en-twintig jaren* [twenty-five years] in 1849, which

revealed unusual social consciousness, and the appearance of the narrative poem *De Slag bij Nieuwpoort* [the battle of Nieuport] in 1859. He was a distinguished scholar in Protestant biblical theology and the classics. His work on Jewish history was translated into English as *Israel and the Gentiles* (1855).

Costa, Lorenzo (lōrēn'sō kō'stā), 1460-1535, Italian painter of the Ferrarese and Bolognese schools. Trained in the manner of such painters as Tura and Cossa, he modified the strident Ferrarese style when he became a partner of Francia. His art became softer and more symmetrical. Among his paintings are the *Madonna and Child with the Bentivoglio Family* and the *Triumphs of Petrarch* in San Giacomo Maggiore, the *Madonna with Saints* in San Petronio, and the *Madonna* in San Giovanni in Monte, all in Bologna. His *Three Saints* is in the Metropolitan Museum.

Costa, Lúcio (lō'syōō kō'stā), 1902-, Brazilian architect. As the principal designer of the city of Brasília (1957), Costa is known for his use of reinforced concrete in designs that combine traditional and modern forms. In Rio de Janeiro, the block of apartments in Guinle Park (1948-54) typifies his streamlined work. The Ministry of Education and Health (1937-42) exhibits his understanding of the effect of climatic considerations on architectural design.

Costa Brava (kō'stā brā'vā), a strip of coast, Gerona prov., NE Spain, in Catalonia, near the French border on the Mediterranean. The area has enjoyed a booming tourist industry since the end of World War II.

cost accounting see ACCOUNTING

Costa e Silva, Artur da (ärtōōr' dā kōsh'tā ē sēl'vā), 1902-69, president of Brazil (1967-69). An army general, he participated in the coup that deposed (1964) President Goulart. He served as war minister (1964-66) under President Castelo Branco and succeeded him in office. He attempted to introduce social and economic reforms, but political criticism of his military regime mounted. In Dec., 1968, he dismissed congress, imposed news censorship, and proceeded to rule by decree. He was incapacitated by a cerebral hemorrhage in Aug., 1969, at which time a military triumvirate took over the government. He died in December of that year.

Costa i Llobera, Miquel (mēgēl' kō'stā ē lyōb'ā'ra), 1854-1922, Catalan poet and orator. In 1888 he was ordained a priest in Rome, where he developed a love of Latin literature. Costa i Llobera's works are serious and contemplative, and they exerted a strong influence on Catalan literature in general. His masterpiece is *Horacianes* [poems in the manner of Horace] (1906). Among his other works are *De l'agre de la terra* [from the bitterness of the earth] (1897) and *Tradicions i fantasies* [traditions and fantasies] (1903).

Costa Mesa (kō'stā mē'sā), city (1970 pop. 72,660), Orange co., S Calif., inc. 1953. Boatbuilding and the manufacture of electronic equipment and tools are the major industries; there are also research laboratories. Orange Coast College and Southern California College are in the city, and the Univ. of California at Irvine is adjacent.

Costa Rica (kō'stā rē'kā), republic (1970 pop. 1,710,083), 19,575 sq mi (50,700 sq km), Central America. The capital is SAN JOSÉ, other important cities are ALAJUELA, HEREDIA, PUNTARENAS (the Pacific port), and CARTAGO. Costa Rica is bounded on the N by Nicaragua, on the E by the Caribbean Sea, on the SE by Panama, and on the S and W by the Pacific Ocean. One of the most stable countries in Latin America, Costa Rica has a long democratic tradition, a literacy rate of over 90%, and no army. The coastal plains are low, hot, and heavily forested. Bananas, cocoa, and sugarcane are cultivated there. In the northwest is the Nicoya peninsula, a semiarid plain where cattle and grain are raised. A massive cordillera, with peaks over 12,000 ft (3,658 m) high, cuts the country from northwest to southeast. Within it, under the shadow of volcanoes such as Irazu, lies the central plateau (meseta central), with a perennially spring-like climate. This plateau is the heart of the country, where coffee is cultivated and most of the population and market facilities are located. Costa Rica is an agricultural country. Coffee, bananas, cocoa, and sugar are exported, and machinery, chemicals, foodstuffs, and fuels are imported. The population is largely of Spanish descent. The country is governed under the 1949 constitution. The president, a strong executive, serves a four-year term and may not be immediately reelected. The unicameral legislature is also elected for four years. There is universal adult suffrage, and voting is compulsory.

History Although Columbus skirted the Costa Rican coast in 1502, the Spanish conquest did not begin until 1563, when Cartago was founded. The region

was administered as part of the captaincy general of Guatemala. Few of the native Indians survived, and the colonists, unable to establish a hacienda system based on Indian labor, generally became small landowners. From Cartago, westward expansion into the plateau began in the 18th cent. Costa Rica became independent from Spain in 1821. From 1822 to 1823 it was part of the Mexican Empire of Augustín de Iturbide. It then became part of the CENTRAL AMERICAN FEDERATION until 1838, when the sovereign republic of Costa Rica was proclaimed. In 1857, Costa Rica participated in the defeat of the filibuster William WALKER, who had taken over Nicaragua. The cultivation of coffee, introduced in the 19th cent., led to the creation of a landed oligarchy that dominated the country until the administration of Tomás GUARDIA (1870-82). In 1874, Minor Cooper KEITH founded LIMÓN and introduced banana cultivation. Keith also started the United Fruit Company. Later many tracts had to be abandoned because of leaf blight, and, after World War II, United Fruit started new plantations on the Pacific coast, these have been worked by Negroes from Jamaica. Costa Rica's history of orderly, democratic government began in the late 19th cent. The pattern was broken in 1917, when Federico Tinoco overthrew the elected president, Alfredo Gonzalez. The United States opposed Tinoco, and he was deposed in 1919. Costa Rica cooperated with the United States during World War II and after the war joined the United Nations and other international organizations. In 1948 there was a second breakdown of the political system. In a close presidential election Otilio Ulate appeared to have defeated the former president, Dr. Rafael Calderón. But the incumbent, Teodoro Picado, accused Ulate's supporters of fraud and obtained a congressional invalidation of the election. A six-week civil war ensued, at the conclusion of which a junta led by José Figueres Ferrer, a backer of Ulate, assumed power. Picado was exiled. Forces from Nicaragua backed Picado, and the Organization of American States (OAS) was called upon to mediate between the two countries. In 1949 a new constitution was adopted, and the junta transferred power to Ulate as the elected president. Figueres was elected his successor in 1953. In UN-supervised elections in 1958, Mario Enchadi Jimenez defeated Figueres's candidate. Politics remained stable in the 1960s. In 1963, Costa Rica joined the Central American Common Market. Figueres was again elected president in 1970. The Irazu volcano erupted in 1963-64 and caused serious damage to agriculture. Another volcano, Arenal, erupted in 1968 for the first time in hundreds of years, killing many. In 1973 a serious drought led to a state of emergency. Daniel Oduber Quirós was elected president in 1974, but the ruling National Liberation Party lost its majority in the legislature for the first time in 25 years. See Ricardo Fernandez Guardia, *History of the Discovery and Conquest of Costa Rica* (1913), C. L. Jones, *Costa Rica and Civilization in the Caribbean* (1935, repr. 1967), D. G. Munro, *The Five Republics of Central America* (1918, repr. 1967), H. I. Blustein et al., *Area Handbook for Costa Rica* (1970), J. P. Bell, *Crisis in Costa Rica: The 1948 Revolution* (1971), C. F. Denton, *Patterns of Costa Rican Politics* (1971), B. H. English, *Liberación Nacional in Costa Rica* (1971).

Costa y Martínez, Joaquín (hwakēn' kō'stā ē märtē'nāth), 1846-1911, Spanish jurist, economist, and sociologist. He wrote works on Spanish law and economics and was the founder of modern Spanish sociology. Among the first to accurately criticize Spain's agrarian economy, he founded the Liga Nacional to promote agricultural reform. After the disaster of the Spanish-American War (1898), he entered politics and later joined the republicans. He

refused to sit in the Cortes when elected in 1904, declaring that Spain could recover prestige and prosperity only through a national revolution

cost of living, amount of money needed to buy the goods and services necessary to maintain a specified standard of living. The cost of living is closely tied to rates of INFLATION and deflation. In estimating such costs, food, clothing, rent, fuel, lighting, furnishings, and miscellaneous items such as recreation, transportation, and medical services are included. Index numbers based on any norm of 100 are used to show changes in the cost of living, and any deviation from that norm demonstrates the rise or fall of the cost of living in a particular year as compared to the normal year or years used as a basis. The first attempt to gather data on the cost of living in the United States was made by the U.S. Bureau of Labor Statistics in 1890. During World War II and immediately following it, many employers established systems of wage changes based on changes in the cost of living, but such attempts were denounced by labor spokesmen as establishing a "fixed" standard of living. However, an agreement using the cost of living index as a basis for the determination of wage rates was signed in May, 1948, between General Motors and the United Automobile Workers of America. Since then many other unions, recognizing the security provided by a cost of living adjustment during times of rising prices, have also had such clauses included in their contracts. People living on social security and pension benefits are among those most affected by changes in the cost of living; their incomes are generally fixed and thus unable to adjust to changing prices. Since World War II the cost of living in most countries of the world has, except for minor interruptions, steadily increased. See bibliography under STANDARD OF LIVING.

costs, legal: see DAMAGES

costume, distinctive forms of clothing including official or ceremonial attire such as ecclesiastical VESTMENTS, coronation robes, academic gowns, ARMOR, and theatrical dress. The use of ornament preceded the use of protective garments, its purpose was to emphasize social position by a great display of trophies, charms, and other valuables and to enhance attractiveness. Superstition, caste distinction, and climatic necessity all have been influential in the evolution of dress. The ancient Egyptian costume for men was first a wrapped loincloth and later a kilt or skirt of pleated and starched white linen. Egyptian women first wore the *kalasiris*, a one-piece, narrow sheath of transparent linen, which was later adopted by men as the tunic. The Egyptian costume evolved into a highly decorative mode of dress characterized by the use of fluted linen, of jewelry (especially the beaded yoke COLLAR), and of COSMETICS and PERFUME, the wig was also worn. The basic Greek garment, noted for its simplicity and graceful draping, consisted of the chiton and girdle. Roman dress, influenced by that of the Greeks, was simple and dignified, the toga, which was worn over the tunic, was the distinctive garment of the Roman citizen. The change from ancient to medieval costume began (c. 400) with the disintegration of the Roman Empire. Roman dress, which had previously assimilated the elaborate features of Byzantine dress, was gradually affected by the austere costume of the barbaric invader. Both men and women wore a double tunic, the under tunic, or chemise, had long tight sleeves (a feature that remained until the 17th cent.) and a high neck, the girded wool overtunic, or robe, often had loose sleeves. A mantle, or indoor cloak, was also worn. After 1200 a great variety of fine fabrics from the East were available as a result of the Crusades, and the elegant dress of feudal Europe was evolved. With the introduction of various ways of cutting the basic garment, FASHION, or style, began. A long, girded tunic, then called the cote or cotte, continued to be worn over the chemise by both men and women, a surcote (sleeveless and with wide armholes) was often worn over it. At this time family crests, or coats of arms (see BLAZONRY, HERALDRY, CREST), became popular, and parti-colored garments came into vogue. Proper fit was increasingly emphasized, and by 1300 tailoring had become important and BUTTONS had become useful as well as ornamental. The belted cote-hardie, with a close-fitting body and short skirt, was worn over a tighter, long-sleeved doublet and a chemise. And, as men's legs were now exposed, HOSE were emphasized. The introduction (c. 1350) of the houppe-lande, or overcoat, marked the first real appearance

of the collar. Over a chemise and corset women wore a gown with a V neck and a long, flowing train, the front of the skirt was often tucked into the high-waisted belt. In its extreme, the style of the period was typified by profuse dagging (scalloped edges), exaggerated, hanging sleeves, pointed slippers, and fantastic headdresses (see HEADRESS and VEIL). After 1450 there was a reversal in fashion from the pointed Gothic look to the square look of the Renaissance. The style in its exaggerated form is best represented in Holbein's paintings of the English court of Henry VIII. Men's costume had wide, square shoulders with puffed sleeves, padded doublets, bombasted upperstocks, or trunk hose, short gowns (cloaks), and square-toed shoes. The doublet, now sleeveless, was worn over the shirt (formerly the chemise) and under the jerkin. Women wore a square-necked gown with the bodice laced up the front and attached to the gathered skirt at the hips, the front of the skirt was often open, to reveal decorative petticoats. These, together with a preference for rich, heavy materials, especially velvet, and a fad for profuse slashing and puffing of the under material seen through the slash, created a massive and bulky appearance. In Elizabethan England (c. 1550) the costume was stiffened, and the appearance was less bulky. Both men and women wore the characteristic "shoulder wings," pointed stomacher, and starched ruff and cuffs made of LACE. Materials were heavy and lustrous and considerable ornamentation was used. Men wore a short cape, and their trunk hose were unpadded, longer, and generally made in sections, or panned. Women wore exaggerated farthingales, or hoops. The early 17th-century English costume was less formal, with a softer line created by satin and silk materials. The period of the Cavalier and Puritan is captured in the court paintings of Van Dyck and in the early work of Rembrandt. Men characteristically wore pantaloons breeches (full trunk hose), high boots, a broad, falling lace or linen collar and cuffs, and a full cloak. In women's costume, the arms began to be displayed and necklines were lower. The bodice was finished with a wide, round collar, or bertha, at the neck, and a flared, pleated, or ruffled skirtlike section, or pepplum, was added at the waist. The apron was often a permanent part of the skirt. In England after 1660, the dress of the Restoration period became extravagantly decorative, using ribbons, flounces, and feathers. The dandies of the period wore petticoat breeches, full-sleeved cambric shirts, and bolero-like doublets. Sir Peter Lely's court paintings show excellent examples of such costume. In the 18th cent., France, under the rule of Louis XIV, became the costume center of the world, with Mme Pompadour, Mme du Barry, and Marie Antoinette successively dictating the fashions of the day, it was the age of the wig, of rococo settings, of delicate pastels and flower-patterned silks, and of EMBROIDERY. Early in the century, Rousseau's ideas affected style of dress. Women's costume became graceful and pastoral, the pointed bodice, tightly laced, was finished with a triangular scarf, or fichu, at the neck, and sleeves were ruffled at the elbow. The bell-shaped hoop appeared c. 1710, and c. 1735 side hoops, or panniers, were popular. Women's costume, which at this period became extremely formal, was gradually softened into a romantic look (as in portraits by Gainsborough) that anticipated the EMPIRE STYLE. The 18th-century man first wore a knee-length cassock that buttoned all the way down over an equally long waistcoat, and buckled knee breeches. As the century progressed, the waistcoat became shorter, the skirt of the coat began to form tails, the collar became higher, and the sleeves and breeches became tighter. The Empire style, associated in early 19th-century France with Josephine, was an attempt to recapture classic simplicity. Women wore a thin muslin dress with a high waist, a low round neck, and puffed short sleeves. Men wore a short-waisted cutaway coat with tails, a high collar, and large lapels and military boots, plain-colored wools became predominant. The whole male appearance was strikingly military. After 1815 women, emphasizing their fragility, achieved the hourglass shape with an extremely tight corset. Their dresses had wide collars, sloping shoulders, leg-of-mutton sleeves, and full skirts. Men wore the frock coat, which was fitted and had a skirt that reached the knees, and trousers were introduced and generally adopted. After 1840, Victorian women wore layers of decorative crinoline and, after 1855, the hoop, sleeves were bell-shaped, and waist and necklines were pointed. Though men still wore the tailcoat and frock coat, the sack coat, sometimes worn with-

out the vest, was becoming popular for everyday wear. In general, men's clothes were becoming looser and more tubular and were predominantly of somber broadcloth. After 1865 the bustle became fashionable for women, at this time, too, women first wore a tailored jacket with collar and lapels—the forerunner of the suit. The growing emphasis on sports, especially tennis and golf, was beginning to affect costume. Knee breeches, called knickerbockers or knickers, came into fashion for men, and sweaters became popular. After 1890 women most often wore the suit or the shirtwaist with balloon sleeves and wasp waist. The dress of the Gibson girl. Men's suits had square shoulders and straight waists and were usually of serge or tweed, the tuxedo was used for formal wear. After 1910, as women's feet and legs began to be exposed, shoes were colored to match the outfit. The nightgown, for women, gave way for a time to pajamas. The popularity of sportswear for men increased, the open-necked shirt was worn and trousers were cuffed and creased. Women's dress after 1914 was characterized by straight lines, e.g., the floor-length hobble skirt and the flapper's boyish, short-skirted costume and matching accessories were popular in the 1920s. The following decades produced radical changes in women's wear, from the flowing skirts of the 30s and the box-jacketed suits of the 40s to the sack dress of the early 60s. Since then the fluctuating hemline has been the predominant concern of fashion. The abbreviated miniskirt has vied for popularity with the full-length maxi and the calf-length midi in coats, skirts, and dresses. Women's clothing has become less restrictive and more casual than in previous eras. The pants suit currently leads in popularity for comfort and elegance. During the 1960s men's clothing underwent revolutionary changes in color and fabric, becoming flamboyant for the first time in the 20th cent. The flaring of trouser cuffs in the 1970s was a major modification in shape. Traditional national dress in Western European countries has generally given way to standardized modes, although traditional costume is still associated with national celebrations and pageantry. The typical costume—a gathered peasant skirt, a full blouse with puffed sleeves, and a laced bodice—is colorful and picturesque, often elaborately fashioned and embroidered, and augmented by kerchief, headdress, and apron. Costume in the Orient had until recently remained unchanged for centuries. In the Arab countries both men and women have for centuries wrapped themselves in voluminous flowing robes that indicate the tribe and status of the wearer by means of style, color, and richness. The people of Malaysia wrap themselves in a loose skirt, or sarong. Chinese dress has been distinguished by the use of magnificent textiles and embroidery and of pearls and jade—all symbolic of rank and wealth. Men and women of the Peoples' Republic of China wear dark-colored trouser suits, whereas in Nationalist China a sheath dress with mandarin collar and side slits in the skirt has become characteristic of women's clothing. Japanese men and women have widely adopted Western modes of dress but many women retain the characteristic kimono and tabi (socks) or geta (wooden clogs). India, too, has traditional costumes dictated by religion or caste. Women in general wear the long draped fabric, or sari, sandals, and profuse jewelry. Exquisite muslins and "painted" cottons have from antiquity been notable features of Indian garments. The term costume also includes accessories, such as the SHOE, HAT, GLOVE, PURSE, CORSET, HANDKERCHIEF, FAN, UMBRELLA, CANE, and JEWELRY, styles of wearing the hair (see HAIRDRESSING) and BEARD, and primitive methods of BODY-MARKING and attaching ornaments to the body. See table of fashion designers under FASHION. See Millia Davenport, *The Book of Costume* (2 vol. in 1, 1962), Blanche Payne, *History of Costume* (1965), James Laver, *The Concise History of Costume and Fashion* (1969), Geoffrey Squire, *Dress and Society* (1974).

Cosway, Richard (kōz'wā), 1740?-1821, English miniaturist. His work was elegant and modish and became highly popular in his day. There is a collection of his works in Windsor Castle. Perhaps best known is the portrait of Mme du Barry. A self-portrait is in the National Portrait Gallery, London. Cosway was married to the miniaturist Maria Hadfield. See biography by G. C. Williamson (1897).

Cotabato (kōtaba'tō), city (1970 est. pop. 51,900), Cotabato prov., W Mindanao, the Philippines, near the mouth of the Mindanao River on Moro Gulf. It has long been a Muslim center. Its port serves a vast, fertile farm area which, as the object of a government colonization program, has had a great popula-

tion increase since World War II Cotabato prov is a focus of coffee cultivation and has important pineapple and peanut crops Rubber is also produced, and lumbering is a major industry The provincial capital is Pagalungan

Côte-d'Or (kōt-dōr'), department (1968 pop 421,192), E France, largely in Burgundy, partly in Champagne DIJON is the capital

Cotentin (kōtaNtāN'), region of N France, in Normandy, roughly coinciding with the peninsula formed by Manche dept and extending into the English Channel CHERBOURG is the chief port, and there are numerous fishing ports The lambs of the Cotentin breed of sheep are highly esteemed for their meat Cattle are also raised in the region Much of the land is divided by hedgerows into small fields and apple orchards An old Norman county, Cotentin takes its name from its historic capital, Coutances

Côtes-du-Nord (kōt-dū-nōr'), department (1968 pop 506,102), NW France, in Brittany, on the English Channel Saint-Brieuc is the capital

Cotinga (kōtīng'ga), any of the New World tropical birds of the family Cotingidae Cotingas range from N Argentina to the southern border of the United States, most are forest species and inhabit the highest treetops Although there is great variation in appearance among these birds, all have broad bills with slightly hooked tips, rounded wings, and strong short legs Some species are dull-colored, with little difference between males and females, in many species, however, the males are brightly colored and have curiously modified wing and head features The umbrella birds (genus *Cephalopterus*), found from Central America to Argentina, have a black, umbrellalike crest, which is raised and expanded during courtship displays, and feathered throat wattles nearly as long as the bird itself The bellbirds (genus *Procnias*), found from Central America to Argentina, have a distinctive bell-like call, they are marked by feather-studded, fleshy protuberances drooping over their bills Both the male and the female cock-of-the-rock (genus *Rupicola*) are marked by a fan-shaped crest of feathers, which extends from bill tip to the top of the head There are two cock-of-the-rock species, in *R. rupicola*, of the Guianas, the male is golden-orange with black wings and tail, while in *R. peruviana*, of the Andes, the male is bright red with similar markings In both species the female is olive brown The cock-of-the-rock, a terrestrial bird, performs a communal mating ritual in which males go through stylized stances and acrobatics There are about 90 species of cotingas classified in 33 genera of the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Cotingidae

Cotman, John Sell, 1782-1842, English landscape painter and etcher He was a leading representative of the Norwich school Cotman studied in London and in 1806 settled in Norwich where he opened an art school He suffered periods of melancholia throughout his life He took up etching c 1810 and produced several series of etchings of English, and later French, antiquities His *Liber Studiorum* (1838) is an outstanding work in this medium For the last nine years of his life he was a drawing master at King's College, London Although Cotman's work was but little appreciated in his day, it is now highly prized for its fine color, decorative and structural qualities, and sustained poetic mood He is best known for his watercolors and drawings, of which the British Museum possesses many, including the famous Greta Bridge Cotman's oil paintings are in many British galleries See catalog by V G R Rie-naecker (1953), biography by S D Kitson (1937)

Cotonou (kōtōnō'), city (1970 est pop 111,000), capital of Atlantique dept, S Dahomey, on the Gulf of Guinea It is Dahomey's chief seaport and commercial center Cotonou's airport and road and rail connections also make it the transportation and communications hub of Dahomey The city has small-scale industries, manufactures include palm oil and cake, peanut oil, textiles, cement and other construction materials, aluminum sheet, beverages, and processed seafood Motor vehicles and bicycles are assembled, and there are sawmills in the city Cotonou is a distribution center for petroleum products Drilling for offshore oil is carried on nearby Cotonou was originally a small state that was dominated by the kingdom of DAHOMEY from the 18th cent In 1851 the French made a treaty with the Dahomean king Gezo that allowed them to establish a trading post at Cotonou In 1883 the French navy forcibly occupied the city to forestall British ambitions in the area Britain confirmed France's

right to Cotonou in 1885 The port was enlarged and modernized in the 1960s Cotonou has research institutes concerned with textiles, tropical agriculture, and geology

Cotopaxi (kōtōpāk'sē), active volcano, 19,347 ft (5,897 m) high, N central Ecuador A symmetrical snowcapped cone, it is one of the most beautiful peaks of the Andes and one of the highest volcanoes in the world It is continuously active, and frequent eruptions have caused severe damage Cotopaxi was first scaled by Wilhelm Reid in 1872

Cotrone: see CROTONA

Cotswold Hills, range, mainly in Gloucestershire, W England, extending c 50 mi (80 km) NE from Bath, Cleve Cloud (c 1,080 ft/330 m) is the highest point Its crest line forms the Thames-Severn watershed The region is famous for Cotswold sheep and for its picturesque stone houses Noteworthy are the many megalithic monuments and long barrows Among the ruins is Hailes Abbey, founded in 1246 The Cotswold Games were held there from the 17th to the 19th cent

Cotswold sheep, large, white-faced, homless breed with a broad, flat back, moderately deep body, heavy fleece, and long, coarse wool hanging in ringlets It was originated in the Cotswold Hills in England The Cotswold is often crossed with the Merino and Rambouillet breeds In the United States it is found mostly in the Northwest

cottage cheese, unripened soft cheese, also known as pot cheese, baker's cheese, Dutch cheese, or smearcase It is produced chiefly in the United States Cottage cheese is made of pasteurized skim milk, which is set with a starter of lactic acid bacteria The curd and whey are separated by low heat The curd is stirred and seasoned with salt, cream, and, in some localities, molasses or sugar The use of skim milk yields a cheese low in fat and vitamin A When sold commercially, it is sometimes mixed with bits of fruits or raw vegetables

Cottage Grove, village (1970 pop 13,419), Washington co, SE Minn, near the St Croix River, inc 1965 Machined-metal products are among the manufactures

cottage industry: see SWEATING SYSTEM

Cottbus or Kottbus (both kōt'bōōs), city (1970 pop 82,897), capital of Cottbus district, E East Germany, on the Spree River It is an industrial center and rail junction Manufactures include textiles, metal products, and processed food Cottbus developed as a market center in the late 12th cent and passed to Brandenburg in the mid-15th cent It was annexed, with the rest of LUSATIA, by Saxony in 1635 and was taken by Prussia in 1815

Cottreau, Jean: see CHOUANS

Cotton, Charles, 1630-87, English author He is chiefly remembered for his contribution to his friend Izaak Walton's *Compleat Angler* (5th ed 1676) His pleasant, unaffected verse includes "An Ode to Winter" and "The Retirement" He also wrote burlesques of Vergil (1664) and Lucian (1665) and a translation of Montaigne's *Essays* (1685-86)

Cotton, George Edward Lynch, 1813-66, English clergyman and educator, grad Trinity College, Cambridge, 1836 From 1837 until 1852 he was an assistant master at Rugby and is the "young master" in Thomas Hughes's *Tom Brown's School Days* He later became (1852) headmaster of Marlborough College and after 1858 served as bishop of Calcutta, where he did extensive missionary work and established numerous schools for Eurasian children See memoir by his wife (1871)

Cotton, John, 1584-1652, Puritan clergyman in England and Massachusetts, b Derbyshire, educated at Cambridge Imbued with Puritan doctrines, he won many followers during his 20 years as vicar of the rich and influential parish of St Botolph's Church, Boston, Lincolnshire He was summoned to appear before the High Court of Commission (1632), but instead of appearing he resigned and fled Some of his followers sailed (1633) with him to Massachusetts Bay, where the young city of Boston was so named primarily to honor him He and John Winthrop were the leading figures of the colony, and Cotton was chiefly responsible for the exile of Anne HUTCHINSON, because of her antinomian doctrines, and for the expulsion of Roger WILLIAMS He was one of the molders of the Congregational Church, and his arguments in such treatises as *The Keys of the Kingdom of Heaven* (1644), *The Way of the Churches of Christ in New England* (1645), and *The Way of the Congregational Churches Cleared* (1648) were influential in his day He was a firm believer in the right of the Congregational minister to dictate to the faithful, and thus he has been viewed as a strong

upholder of theocracy His *Milk for Babes* (1646) was a well-known catechism for children His daughter was the wife of Increase MATHER and the mother of Cotton MATHER See biographies by Larzer Ziff (1962) and Everett Emerson (1965)

Cotton, Sir Robert Bruce, 1571-1631, English antiquarian The Cottonian collection of books, manuscripts, coins, and antiquities became a part of the British Museum when it was founded in 1753 Cotton collected especially Hebrew and Greek manuscripts and Anglo-Saxon charters An unprinted classified catalog of the collection is in the Harleian MSS of the British Museum Cotton was an antiroyalist parliamentarian whose opinions brought him two terms in prison His magnificent library was sealed in 1630 and remained so until after his death

Cotton, Thomas Henry (Henry Cotton), 1907-, British golfer, b Cheshire, England Although a professional at 17, Cotton did not achieve international recognition until he won the British Open in 1934 He again won this title in 1937 and in 1948, in addition to three British Professional Golf Association crowns and many European championships Cotton played on three British Ryder Cup teams and twice was captain He wrote *The Game of Golf* (1949)

cotton, most important of the vegetable fibers Cotton has been spun, woven, and dyed since prehistoric times It formed the staple clothing of India, Egypt, and China Hundreds of years before the Christian era cotton textiles were woven in India with matchless skill, and their use spread to the Mediterranean countries In the 1st cent Arab traders brought fine MUSLIN and CALICO to Italy and Spain The Moors introduced the cultivation of cotton into Spain in the 9th cent Fustians and dimities were woven there and in the 14th cent in Venice and Milan, at first with a linen warp Little cotton cloth was imported to England before the 15th cent, although small amounts were obtained chiefly for candlewicks By the 17th cent the East India Company was bringing rare fabrics from India Before the arrival of the white man in the New World, cotton was skillfully spun and woven into fine garments and dyed tapestries Cotton fabrics found in Peruvian tombs are said to belong to a pre-Inca culture In colors and texture, the ancient Peruvian and Mexican textiles resemble those found in Egyptian tombs Cotton cultivation began in America in the Jamestown colony (1607) Since the early days of the republic, the United States has been the world's leading producer of cotton The invention (1793) of the cotton gin, a machine for separating seeds from fiber, and the mechanization of textile production marked the Industrial Revolution and suddenly brought cotton into world prominence to supersede flax and wool textiles The manufacture of cotton goods is a great industry, second only to that of Great Britain (where it centers about Lancashire) For some years American manufacture was chiefly in New England, today an increasing number of mills are located in the Southern cotton-producing states, the so-called Cotton Belt Cotton has played a significant historical role in world industry The reliance of British mills on imported cotton fiber influenced that country's accession to the Monroe Doctrine, and its need for the large African and Indian markets for cotton goods dictated much of its sea-domination policy as an imperial nation In the United States, cotton brought about the one-crop economy of the Deep South and was a principal economic cause of the Civil War The passing of slavery, always an adjunct of the cotton plantations, and the exhaustion of the soil pushed the Cotton Belt to the West Large cotton-producing countries such as Brazil, Egypt, and India (the second largest world producer) have used cotton exports to offset an unfavorable balance of trade China and the USSR rank after the United States and India in total annual production All cotton-producing nations have depended on an abundance of cheap labor, although mechanical cultivating and picking devices have long been known, they have been perfected for widespread use (especially in the United States) only since World War II The cotton plant belongs to the genus *Gossypium* of the family Malvaceae (MALLOW family) It is generally a shrubby plant having broad three-lobed leaves and seeds in capsules, or bolls, each seed is surrounded with downy fiber, white or creamy in color and easily spun The fibers flatten and twist naturally as they dry Cotton is of tropical origin but is most successfully cultivated in temperate climates with well-distributed rainfall In the United States nearly all the commercial cotton crop comes from varieties of upland cotton (*G. hirsutum*), but small quantities are

obtained from sea-island and American-Egyptian cotton (both belonging to the species *G. barbadense*). *G. arboreum* and *G. herbaceum* are the chief cultivated species in Asia. Cotton is planted annually by seed in furrows, the plants are thinned and weeded during the spring growing season. Diseases and insect pests are numerous, of these the most destructive is the BOLL WEEVIL, which causes enormous losses. Sea-island cotton, valued for its silky fibers, was the leading type before the advent of this insect, to which it is particularly susceptible. When mechanical pickers are employed, a chemical defoliant is used to make the leaves drop so that only the cotton bolls are left on the plant for stripping. In the ginhouse the cotton is separated from the seeds by a COTTON GIN and then baled. The usual plantation bale, weighing 500 lb (227 kg), is covered with jute and bound with iron hoops. The U.S. Dept. of Agriculture has established official standards for grades of cotton. The manufacture of cotton into cloth involves many processes—CARDING, COMBING, and SPINNING, which bring the raw fiber to a yarn or thread strong enough for weaving. Innumerable commodities are made from cotton. From the lint (the fiber separated from the seed) come the major products, chiefly TEXTILE and YARN goods, cordage, automobile-tire cord, and plastic reinforcing. The linters (short cut ends left on the seed after ginning and later removed by specialized processing) are a valuable source of CELLULOSE products. Cotton hulls are used for fertilizer, fuel, and packing, fiber from the stalk is used for pressed paper and cardboard. Production of the chief by-product, cottonseed oil, has assumed the importance of a separate industry since its establishment in the late 19th cent. The oil content of cotton seeds is about 20%. After being freed from the linters, the seeds are shelled and then crushed and pressed or treated with solvents to obtain the crude oil. In its highly refined state, cottonseed oil is employed as salad and cooking oil, for cosmetics, and especially in the manufacture of margarine and shortenings. Paint makers use it to some extent as a semidrying oil. Less refined grades are used in the manufacture of soap, candles, detergents, artificial leather, oilcloth, and many other commodities. The cottonseed oil industry is becoming increasingly important to cotton growers as cotton fiber finds greater competition in the cheaper and stronger synthetic fibers. Cotton is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Malvales, family Malvaceae. See D. S. Hamby, ed., *The American Cotton Handbook* (2 vol., 3d ed. 1965-66), W. H. Fortenberry, *The Story of Cotton* (1967), Clifford Shaw and Frank Eckersley, *Cotton* (1967), J. L. Sinclair, *The Production, Marketing, and Consumption of Cotton* (1968).

Cotton Belt, major agricultural region of the SE United States where cotton is the main cash crop. Located on the Atlantic and Gulf coastal plains and on the Piedmont upland, it extends through North Carolina, South Carolina, Georgia, Alabama, Mississippi, West Tennessee, East Arkansas, Louisiana, East Texas, and South Oklahoma, and also into small areas of SE Missouri, SW Kentucky, Florida, and SE Virginia. The belt has the climatic conditions necessary for cotton to thrive—high temperatures, from 30 to 55 in (76.2–139.7 cm) annual rainfall, and a 200-day growing season. A modified plantation system exists there. The Cotton Belt, no longer continuous, is made up of many separate intensive production areas, corn, wheat, soybeans, peanuts, beans, and livestock are important in the intervening areas. Until the invention of the cotton gin in 1793, the Cotton Belt was confined to the coastal areas of South Carolina and Georgia, by the mid-1800s, it extended from South Virginia to East Texas. Post-Civil War reforms, soil depletion, and the boll weevil combined to push cotton west. Increasing amounts of irrigated cotton are grown in West Texas, South New Mexico, Arizona, and California, where aridity makes it easier to control insect pests. Texas, Mississippi, and Arkansas are the leading producers of cotton in the belt, California ranks after Texas nationally. See BLACK BELT, IMPERIAL VALLEY.

cotton gin, machine for separating cotton fibers from the seeds. The charkha, used in India from antiquity, consists of two revolving wooden rollers through which the fibers are drawn, leaving the seeds. A similar gin was early used in the SE United States for long-staple cotton. In the modern roller gin, rollers covered with rough leather draw out the fibers, which are cut off by a fixed knife pressed against the rollers. This type of gin cleans only about two bales per day, but it does not snarl or break the fibers. The saw gin, invented by the American inventor Eli Whitney in 1793 and patented in 1794, con-

sisted of a toothed cylinder revolving against a grate that enclosed the seed cotton. The teeth caught the fibers, pulling them from the seeds, the fibers were then removed from the cylinder by a revolving brush. This device, especially suited to short- and medium-staple cotton, has been mechanized and is used in commercial plants that are also called gins, where the fiber is conveyed from farm wagon to baler by air suction. Such plants have one or more gin stands, each with a series of from 70 to 80 circular saws set on a shaft. The fibers, freed from dirt and hulls, are pulled through a grid by the saw teeth to remove the seeds. The fibers are removed from the saw teeth by a revolving brush or by a blast of air (in more modern plants) and are then carried by air blast or suction to a condenser and finally to the baling apparatus.

cotton grass, common name for SEDGES of the genus *Eriophorum*.

cottonmouth. see WATER MOCCASIN

cottonseed oil: see COTTON

cottontail rabbit, animal of the order Lagomorpha, which includes the hares and rabbits, except for the domestic, or European, RABBIT, which is in a separate species. Members of the genus *Sylvilagus*, cottontails have large ears and short legs and move with a scurrying or scampering gait. Unlike the European rabbit, they do not dig their own burrows but make a nest in a depression in the ground. Unlike hares, they seek protection in hiding rather than in swift flight. The cottontail ranges from the southern border of Canada to North Argentina. There are six races. Cottontails are a common source of TULAREMIA, or rabbit fever. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Lagomorpha, family Leporidae.

cottonwood: see WILLOW

Cottrell, Leonard, 1913–, British author and archaeologist, grad. King Edward's Grammar School, Birmingham. He was a commentator, writer, and producer for the British Broadcasting Corporation until 1960, when he resigned to devote himself to writing. During World War II he was stationed in the Mediterranean with the Royal Air Force as a war correspondent. Among his many books are *The Bull of Minos* (1958), *The Great Invasion* (1958), *Realms of Gold* (1963), *Egypt* (1965), and *Lost Civilizations* (1974). He was the editor of the *Concise Encyclopedia of Archaeology* (1965).

Coty, René (ranā' kōtē'), 1882–1962, French president (1954–59). From 1923 to 1940 he served in the legislature, first as a deputy and then as a senator. In 1940, when France fell to the Germans, he voted to hand all power to Marshal Pétain. After a wartime spent in retirement, Coty returned to the legislature and in Dec., 1953, was elected president as a compromise candidate. In the crisis of May, 1958, he threatened resignation if Charles de Gaulle were not made premier, he left office with the creation (1959) of the Fifth Republic.

cotyledon (kōt'ālēd'ən), in botany, a leaf of the embryo of a SEED. The embryos of flowering plants, or ANGIOSPERMS, usually have either one cotyledon (the monocots) or two (the dicots). Seeds of gymnosperms, such as pines, may have numerous cotyledons. In some seeds the cotyledons are flat and leaf-like, in others, such as the bean, the cotyledons store the seed's food reserve for germination and are fleshy. In most plants the cotyledons emerge above the soil with the seedling as it grows.

couch grass, name for several grasses, among them QUACK GRASS.

Coucy, Robert de (rōbēr' də kōōsē'), d. 1311, French architect, celebrated for his part in the building of Rheims Cathedral, which he carried on as master of the works after the death of Hugues Libergier in 1263. Probably the Robert de Coucy traditionally known as the original architect of Rheims Cathedral, after the fire of 1211, was his father, their separate works on the cathedral have been confused.

Coude focus. see TELESCOPE

Coudert, Frederic René (kōōdār'), 1832–1903, American lawyer and public official, b. New York City. He practiced law in New York City and for many years was counsel in the United States for the French, Italian, and Spanish governments. He was (1880) a member of the international conference at Bern for the codification of the law of nations, served (1893–95) as counsel for the United States in the Bering Sea fur-seal arbitration at Paris, and was (1896–98) a member of the Venezuela Boundary Commission. He was active in political reform movements in New York City and was a trustee of many educational institutions.

Coué, Émile (āmēl' kwā), 1857–1926, French psychotherapist. He is remembered for his formula for curing by optimistic autosuggestion, "Day by day, in every way, I am getting better and better." His teaching achieved a vogue in England and the United States in the 1920s.

Coues, Elliott (kouz), 1842–99, American ornithologist, b. Portsmouth, N.H., grad. Columbian College, later Columbian Univ. and now George Washington Univ. (B.A., 1861, M.D., 1863, Ph.D., 1869). He served as an army surgeon in the Civil War and as naturalist on government surveys and taught (1877–87) at Columbian Univ. He was a founder of the American Society for Psychical Research and a leader in the theosophist movement. He wrote *Key to North American Birds* (1872), *Birds of the Northwest* (1847), *Fur-bearing Animals* (1877), and *Birds of the Colorado Valley* (1878), he edited the journals of Lewis and Clark (1893), Zebulon M. Pike (1895), and Alexander Henry and David Thompson (1897).

cough: see PUMA

cough, sudden forceful expiration of air from the lungs caused by an involuntary contraction of the muscles controlling the process of breathing. The cough is a response to some irritating condition such as inflammation or the presence of mucus (sputum) in the respiratory tract, as in infectious disease, or to heavy dust or industrial or tobacco smoke. Coughing may also be a reflex action to factors outside the respiratory tract, diseases that are not respiratory in nature (e.g., congestive heart failure or mitral valve disease) often bring on coughing. If there is mucus or a foreign substance in the respiratory tract, the cough should not be hindered since by this action the offending matter is expelled from the body. If, however, the cough becomes exhausting, sedation is indicated.

Coughlin, Charles Edward (kōg'lin), 1891–, Roman Catholic priest in the United States, b. Ontario, Canada, grad. Univ. of Toronto, 1916. After study at St. Michael's College, Toronto, he was ordained (1916) and became (1926) pastor of the Shrine of the Little Flower at Royal Oak, Mich. In the 1930s he made radio addresses in which he criticized such diverse groups as U.S. bankers, trade unionists, and Communists. In 1934 he organized the National Union for Social Justice, which denounced President Franklin Delano Roosevelt's New Deal policies and advocated such measures as silver inflation as well as the nationalizing of banks, utilities, and natural resources. Coughlin also published a magazine, *Social Justice*, in which he expressed pro-Nazi opinions and made increasingly anti-Semitic remarks directed especially at Jewish members of Wall Street. The magazine was barred from the mails by the U.S. government for violation of the Espionage Act and ceased publication in 1942. Father Coughlin was meanwhile silenced by his superiors but continued his parish duties.

Coulomb, Charles Augustin de (kōō'lōm, kōōlōm', Fr. sharl' oōstān' də kōōlōn'), 1736–1806, French physicist. In 1789 he retired from his posts as military engineer and as superintendent of waters and fountains and devoted himself to continuing his scientific research. He was known for his work on electricity, magnetism, and friction, and he invented a magnetoscope, a magnetometer, and a torsion balance that he employed in determining torsional elasticity and in establishing COULOMB'S LAW. The unit of quantity of electric charge, the coulomb, is named in his honor. See study by C. S. Gilmor (1971).

coulomb (kōō'lōm), abbr. coul or C, unit of electric CHARGE. The absolute coulomb, the current U.S. legal standard, is the amount of charge transferred in 1 second by a current of 1 AMPERE, i.e., it is 1 ampere-second. The international coulomb, which was the legal standard before 1950 and upon which the definition of the ampere was formerly based, is defined as the amount of charge that, when passed through a water solution of silver nitrate under certain standard conditions, will cause the deposit of a certain mass (approximately 1.1 mg) of metallic silver, 1 international coul equals 0.999835 absolute coul.

Coulomb's law (kōō'lōmz), in physics, law stating that the electrostatic force between two charged bodies is proportional to the product of the amounts of charge on the bodies divided by the square of the distance between them. If the bodies are oppositely charged, one positive and one nega-

tive, they are attracted toward one another, if the bodies are similarly charged, both positive or both negative, the force between them is repulsive (see CHARGE, ELECTRIC) Coulomb's law applies exactly only when the charged bodies are much smaller than the distance separating them and therefore can be treated approximately as point charges When combined with principles of quantum physics, Coulomb's law helps describe the forces that bind electrons to an atomic nucleus, that bind atoms together into molecules, and that hold together solids and liquids The law was deduced in 1785 by C A de Coulomb from experimental measures of the forces between charged bodies, the experiments were made using his torsion balance

council, ecumenical (ĕk'yōōmĕn'ĭkəl) [Gr. = universal], in Christendom, council of church authorities accepted by the church as the official voice, also called general council The utterances of such a council are called canons, the first being usually a detailed statement of the common faith The acceptance of the canons is unequal, thus, Roman Catholics regard them as binding (canonical) only when a pope has subsequently ratified them, and many canons of several councils have never been accepted The following is the list of the general councils recognized by Roman Catholics (the numbering is the customary one, and the opening year is given) (1) 1 Nicaea, 325, (2) 1 Constantinople, 381, (3) Ephesus, 431, (4) Chalcedon, 451, (5) 2 Constantinople, 553, (6) 3 Constantinople, 680, (7) 2 Nicaea, 787, (8) 4 Constantinople, 869, (9) 1 Lateran, 1123, (10) 2 Lateran, 1139, (11) 3 Lateran, 1179, (12) 4 Lateran, 1215, (13) 1 Lyons, 1245, (14) 2 Lyons, 1274, (15) Vienne, 1311, (16) Constance, 1414, (17) Basel and Ferrara-Florence, 1431, 1438, (18) 5 Lateran, 1512, (19) Trent, 1545, (20) 1 Vatican, 1869, (21) 2 Vatican, 1962 (See separate article on each council, e.g., NICAEA, FIRST COUNCIL OF) The Orthodox Eastern Church recognizes the first seven and counts the Trullan Synod of 692 as an ecumenical extension of the Third Council of Constantinople The first council was the model for the rest The common purpose of the first eight councils was to determine whether specific theological novelties were orthodox or heretical (not orthodox) The rest of the councils, all held in Western Europe, have dealt chiefly with church discipline and morals Two of them, the Second Council of Lyons and the Council of Ferrara-Florence, were occupied with abortive attempts at reconciliation between East and West In the Great Schism arose the conciliar theory, which held that an ecumenical council is superior to the pope, that theory was in its heyday at the Council of Constance (see SCHISM, GREAT) The Council of Trent, convened to deal with the Protestant Reformation, was probably the most far-reaching in its effects The traditional opinion is that when the bishops of the world unite to define belief in the light of what they have received from their predecessors, God will protect them from error This is a manifestation of the infallibility of the teaching church, and papal infallibility is compared to it in the definition published by the First Vatican Council (see INFALLIBILITY) Two famous councils that claimed in vain to be ecumenical are the Robber Council of Ephesus (see EUTYCHES) and the Council of Pisa in the Great Schism Pope John XXIII established as one of the principal themes of the Second Vatican Council the reunion of all Christians with the Church of Rome Protestants, rejecting the teaching authority of the church, do not regard ecumenical councils and their canons as binding on the conscience Protestant observers, however, have officially attended the last two councils The ECUMENICAL MOVEMENT among Protestants is not to be confused with an ecumenical council, although they share a similar aim See studies by Lorenz Jaeger (tr 1961), Philip Hughes (1961), Francis Dvornik (1961), and E F Jacobs (rev ed 1963)

Council Bluffs, city (1970 pop. 60,348), seat of Pottawattamie co., SW Iowa, on and below bluffs overlooking the Missouri River, opposite Omaha, Nebr., inc. 1853 It was the site of an Indian trading post and of a Pottawattamie Indian mission before 1846, when it was settled by Mormons and named Kanesville When the Mormons departed in 1852, the settlement was renamed Council Bluffs An important supply point during the gold rush (1849-50), Council Bluffs was made the eastern terminus of the Union Pacific RR in 1863 The city is now an important trade and industrial center for a large agricultural area It has grain elevators, and its manufactures include processed foods, cast-iron pipes, farm equipment, electronic equipment, and fabricated metals Among the points of interest in the city are Dodge House, a national historic landmark and the

former home of Gen. G. M. Dodge, founder of the Union Pacific RR, the Lewis and Clark monument, which commemorates the meeting held near there in 1804 between U.S. explorers Lewis and Clark and the Indians, and the Lincoln monument, built in honor of Abraham Lincoln's visit to Council Bluffs in 1859 Iowa Western Community College is there, and Lake Manawa State Park lies entirely within the city limits An extensive levee system along the Missouri River protects the part of the city below the bluffs

Council for Mutual Economic Assistance (COMECON or CMEA), international governmental organization for the coordination of economic policy among certain Communist nations Its members include Albania (which has not participated since 1961), Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Rumania, and the Soviet Union Yugoslavia participates in matters of mutual interest but is not a member First formed in 1949, the council was relatively dormant until 1954 In 1956 its activities were greatly expanded, and in 1959 a formal charter was ratified giving COMECON the same international status as the European Free Trade Association and the Common Market To meet the challenge of these Western associations, COMECON undertook large-scale measures for organization of industrial production and coordination of economic development by conducting a series of five-year plans (1956-60, 1961-65, 1966-70, and 1971-75) During the first 15 years of its existence, trade among COMECON countries and foreign trade increased by over 400% However, growth of both types of trade declined after that period

counselor at law. see ATTORNEY

counterfeiting, manufacturing spurious coins, paper money, or evidences of governmental obligation (e.g., bonds) in the semblance of the true There must be sufficient resemblance to the genuine article to deceive a person using ordinary caution The offense may be regarded as a special variety of FORGERY The crime affects property but was historically considered to be an interference with the administration of government Hence, under an early English statute (1350), counterfeiting the king's seal or his gold and silver coinage was a grave crime against the state amounting to high TREASON and was punishable by death The statute left unchanged the common-law misdemeanors of counterfeiting copper coinage and passing counterfeit foreign currency Other early statutes were directed against debasing the coinage by clipping or filing off the edges to sell the metal By the 19th cent. counterfeiting was considered a felony rather than a form of treason Article 1, Section 8, of the U.S. Constitution authorizes Congress to "provide for the punishment of counterfeiting the Securities and current Coin of the United States" Under that power, statutes have been enacted making criminal the counterfeiting of the currency and bonds of the United States, of the evidences of indebtedness (e.g., checks) of the Federal Reserve System, of postage stamps, and of foreign money used for exchange Under its powers to define and punish offenses of international law and its powers to control interstate and foreign commerce, Congress has passed legislation against the counterfeiting of foreign money and securities within the United States Nearly every state now has statutes against counterfeiting Since its establishment in 1865 the U.S. Secret Service has been the primary agency in the combating of counterfeiters in the United States To commit the crime of counterfeiting one does not necessarily have to make a whole coin or bill It may be accomplished by plating coins, by raising the amount of a bill, or by any other alteration calculated to deceive the recipients To retain counterfeit money or government obligations knowingly is also a criminal offense, regardless of how possession was acquired The knowing utterance (passing) of counterfeit currency or securities is also criminal For the further protection of the currency and of postage stamps, statutes forbid making certain types of photographs (e.g., in color) where there would be danger of deception See Lynn Glaser, *Counterfeiting in America* (1968)

counterglow. see GEGENSCHNEI

counterpoint, in music, the art of combining melodies each of which is independent though forming

part of a homogeneous texture The term derives from the Latin for "point against point," meaning note against note in referring to the notation of PLAINSONG The academic study of counterpoint was long based on *Gradus ad Parnassum* (1725, tr. 1943) by Johann Joseph Fux (1660-1741), an Austrian theorist and composer This work formulates the study of counterpoint into five species—note against note, two notes against one, four notes against one, syncopation, and florid counterpoint, which combines the other species Countless textbooks have followed this method, but since the early 20th cent. several theorists have based their courses in counterpoint on a direct study of 16th-century contrapuntal practice The early master composers of contrapuntal music include PALESTRINA, LASSO, and BYRD Polyphonic forms were later given a most brilliant and sophisticated expression during the BAROQUE era in the works of J. S. BACH See also POLYPHONY, IMITATION See Walter Piston, *Counterpoint* (1947), Humphrey Searle, *Twentieth Century Counterpoint* (1954), Kent Kennan, *Counterpoint* (2d ed. 1972)

Counter Reformation: see REFORMATION, CATHOLIC

countertenor, a male singing voice in the ALTO range Singing in this range requires a special vocal technique called falsetto Countertenor singers were required during the Renaissance and Baroque periods because social and religious conventions restricted women from public singing See also CASTRATO

country and western music, American popular music form originating in the Southeast (country music) and the Southwest and West (western music) The two regional styles coalesced in the 1920s when recorded material became available in rural areas, and they were further consolidated after musicians from various sections met and mixed during service in World War II The primary difference between the two styles is that country music is simpler and uses fewer instruments, relying on guitar, fiddle, banjo, and harmonica, whereas the music of the Southwest tends toward steel guitars and big bands whose style verges on swing (e.g., The Light Crust Doughboys) Country and western music is directly descended from the folk songs, ballads, and popular songs of the English, Scottish, and Irish settlers of the southeastern seaboard of the United States Its modern lyrics depict the emotion and experience of rural and (currently) urban poor whites, they often tell frankly of illicit love, crime, and prison life Over the last 50 years country and western music has gained a nationwide audience Since 1924 the "Grand Ole Opry," a Saturday night performance featuring country and western singers, has broadcast weekly from Nashville, Tenn. Many of the musicians have been influenced by black blues and GOSPEL MUSIC, but the performers and audience are almost all white Leading performers include Hank Williams, Jimmy Rogers, Johnny Cash, Tex Ritter, June Carter, the Carter family, Merle Haggard, Loretta Lynn, Jim Reeves, Tammy Wynette, Eddie Arnold, Charlie Pride (a black man), and Charlie Rich See Bill C. Malone, *Country Music USA* (1968), Paul Hemphill, *The Nashville Sound* (1971)

Counts, George Sylvester, 1889-1974, American educator, b. near Baldwin City, Kansas, grad. Baker Univ., 1911, Ph.D. Univ. of Chicago, 1916 He taught in the educational departments of several universities before joining the faculty of Teachers College, Columbia Univ., in 1927 A strong advocate of teachers' unions, he ran for public office on the American Labor party ticket and was president (1939-42) of the AMERICAN FEDERATION OF TEACHERS His works include *The American Road to Culture* (1930), *The Prospects of American Democracy* (1938), *The Challenge of Soviet Education* (1957), and *Education and the Foundations of Human Freedom* (1962) See study by G. L. Gutek (1971)

county [from Fr. *comté*, = domain of a count], division of LOCAL GOVERNMENT in the United States, Great Britain, and many Commonwealth countries The county developed in England from the shire, a unit of local government that originated in the Saxon settlements of the 5th cent. By the 11th cent. the shire system was fully established throughout most of England, with each shire being ruled by a shire-reeve, or sheriff, appointed by the crown By the 14th cent. the office of justice of the peace had developed, in each county a court of three or four justices, also appointed by the king, assisted the sheriff in the administration of local affairs With the passage of the Local Government Act of 1888, power passed from the king's appointed officials to the newly created county councils, elected by local residents The county system of government was

adopted in most of the nations settled by the British. Throughout the English-speaking world, for example, most courts are still organized by counties. In the United States there are approximately 3,000 counties, most of which are either rural or suburban. Louisiana, influenced by the French, has parishes, which are essentially similar to counties. The major functions of county government in the United States include law enforcement, the recording of deeds and other documents, and the provision and maintenance of public works such as roads and parks. See H. S. Duncombe, *County Government in America* (1966), J. C. Bollens, *American County Government* (1969).

coup (kōō) [Fr. = blow], among North American Indians of the Plains culture, a war honor, awarded for striking an enemy in such a way that it was considered an extreme act of bravery. Coups were awarded according to the degree of recklessness involved, the most reckless, such as striking an armed enemy with the bare hand, counted highest. Killing an enemy, wounding him, scalping him, or stealing his horse or gun—all these were coups of value. Recital of the deeds was an important social function, and a warrior with many coups held a high status and was honored at feasts, ceremonies, and in the tribe. After warfare had ceased, coups became transferable property, passing from the old men to the younger, who needed coups to acquire warrior status in the tribe.

Couper, James Hamilton (kōō'pär), 1794–1866, American planter of Georgia, grad. Yale, 1814. Influential in promoting agricultural research and experimentation, he was a pioneer in the cultivation of rice, long-staple cotton, and sugarcane and introduced new plants, including Bermuda grass.

Couperin, François (frāNswā' kōōpärāN'), 1668–1733, French harpsichordist and composer, called "le Grand" to distinguish him from the other musicians in his family. His harpsichord music, in its charm, delicacy, and graceful ornamentation, represents the culmination of French rococo. He published four books of harpsichord suites (1713–30), which generally consisted of short, highly ornamental pieces, with descriptive titles such as *Les Abeilles*, *Les Papillons*, *La Voluptueuse*, and *Le Rossignol en amour*. His style of harpsichord playing, formulated in *L'Art de toucher de clavecin* (1716), influenced the keyboard technique of Bach. Couperin also composed much religious and chamber music and works for the organ. He was organist (1685–1733) at St. Gervais, Paris, a position held by members of the Couperin family from c. 1650 until 1826. In 1693, Couperin was chosen by Louis XIV as one of the organists of the royal chapel, and later he was made music master of the royal family and harpsichordist at the royal court. The Couperin line of musicians had begun with three brothers—Louis (c. 1626–1661), an organist, violinist, and composer of harpsichord suites, which are characterized by a vigorous, frequently dissonant style, François (c. 1631–c. 1701), a harpsichordist and violinist, and Charles (1638–79), an organist, the father of Couperin le Grand. The line extended to the great-grandsons of François, the second brother—Pierre Louis (1755–89) and François Gervais (1759–1826), who were organists at St. Gervais. See biography by P. Brunold (1949).

Couperus, Louis Marie Anne (lōwē marē' an kōōpā'-rōōs), 1863–1923, Dutch novelist. In his early works he emphasized with graceful irony the determining forces of man's past and environment, this fatalism characterizes all his novels. Couperus is best known for the realistic family saga *De Boeken der kleine Zielen* (4 vol., 1901–3, tr. *The Book of the Small Souls*, 4 vol., 1914–18). Other works include symbolic fairy tales and verse.

Courbet, Gustave (gustav' kōōrbā'), 1819–77, French painter, b. Ornans. He studied in Paris, learning chiefly by copying masterpieces in the Louvre. An avowed realist, Courbet was always at odds with vested authority, aesthetic or political. In 1847 his *Wounded Man* (Louvre) was rejected by the Salon, although two of his earlier pictures had been accepted. He first won wide attention with his *After Dinner at Ornans* (Lille) in 1849. The next year he exhibited his famous *Funeral at Ornans* and *Stonebreakers* (both Louvre). For his choice of subjects from ordinary life, and more especially for his obstinacy and audacity, his work was reviled as offensive to prevailing politics and aesthetic taste. Enjoying the drama, Courbet rose to defend his work as the expression of his newfound political radicalism. His statements did nothing to recommend the work to his enemies. In 1855, Courbet exhibited the mam-

moth, self-congratulatory *Painter's Studio* (Louvre). Attacked by academic painters of every persuasion, he set up his own pavilion where he exhibited 40 of his paintings and issued a manifesto on realism. Within the next decade he triumphed as the leader of the realist school. His influence became enormous, reaching its height with his rejection of the cross of the Legion of Honor offered him by Napoleon III in 1872. Under the Commune, Courbet was elected to the chamber and in consequence was later held responsible, fined, and imprisoned for the destruction of the Vendôme column. In 1873 he fled to Switzerland, where he spent his few remaining years in poverty. Although his aesthetic theories were not destined to prevail, his painting is greatly admired for its frankness, vigor, and solid construction. Courbet is represented in galleries throughout France and the United States. The Metropolitan Museum has more than 20 of his works. See biography by Jack Lindsay (1974), study by T. J. Clark (1973).

Courbevoie (kōōrbvōv'), city (1968 pop. 58,283), Hauts-de-Seine dept., N. central France, on the Seine River. An industrial suburb of Paris, Courbevoie manufactures automobiles, bicycles, perfumes, and pharmaceuticals. There are also electrical industries, foundries, and copper works. The Avenue du Général de Gaulle, which runs through Courbevoie, is a continuation of the CHAMPS ÉLYSÉES of Paris.

Courcelle, Daniel Remy, sieur de (danyēl' rāmē' syor' də kōōrsēl'), d. 1698, governor of New France (1665–72). He arrived with the intendant Jean Talon, and together they inaugurated a period of peace and prosperity. Courcelle led (1666) an unsuccessful winter raid on the Mohawk Indians, but a campaign in Sept., 1666, under the marquis de Tracy and Courcelle induced the Iroquois to conclude a peace that was kept for a number of years. In 1671 he led to Lake Ontario an expedition that chose the site for a fort later established as Fort Frontenac. While governor, Courcelle instituted militia service for all males and supported the expeditions of Robert de La Salle and Louis Jolliet. Ill health led him to request his recall to France in 1672, and the comte de Frontenac took his place as governor. Courcelle was later appointed governor of Toulon, where he died.

coureurs de bois (kōōror' də bwā) [Fr. = woods runners], unlicensed traders during the French regime in Canada. Traders were required to be licensed, but to only a favored few were licenses granted. The *coureurs de bois* defied regulations and ventured into the Canadian wilderness. Although they stimulated the growth of the fur trade and the exploration of Canada, their defiance caused problems for the government of New France and contributed to poor relations with the Indians, to whom they sold liquor. Toward the end of the 17th cent. it was estimated that one third of the able-bodied men of the colony were *coureurs de bois*, although this may be an exaggeration.

Courier, Paul Louis (Paul Louis Courier de Mere) (pōl lwē kōōryā' də mārā'), 1772–1825, French political writer and classical scholar. His translation (1810) of the Greek text of *Daphnis and Chloe* is considered excellent. After the Bourbon restoration, which he opposed, he devoted himself to writing trenchant political pamphlets, the best known of which are *Simple Discours* (1821), for which he was jailed, and *Le Pamphlet des pamphlets* (1824), remarkable for its stylistic brilliance. His memoirs and letters (1828) have the same original charm that makes his literary works memorable. He was murdered, presumably by one of his servants.

courlan (kōōrlān) see LIMPKIN

Courland or **Kurland** (both kūr'lānd, Ger. kōōr'-lant), Lettish Kurzeme, historic region and former duchy, W. European USSR, in Latvia, between the Baltic Sea and the Western Dvina River. It is an agricultural and wooded lowland. Yelgava (Ger. *Mitau*), the historic capital, and Liepaya (Ger. *Libau*) and Ventspils (Ger. *Windau*), the Baltic seaports, are the chief cities. The early Baltic tribes—Letts and Kurs—who inhabited the region were subjected in the 13th cent. by the LIVONIAN BROTHERS OF THE SWORD. In 1561 the order disbanded and its grand master became the first duke of Courland, under Polish suzerainty. In the Northern War (1700–21), it was taken (1701) by Charles XII of Sweden. Empress Anna, who was, by marriage, duchess of Courland before her accession in Russia, forced (1737), the nobles of Courland to elect her favorite, Ernst Johann von Biron, their duke. Russian influence became paramount, and with the third partition of Poland (1795) the duchy passed to Russia. In 1918, Courland was incorporated into Latvia, except for a strip of the southern coast that went to Lithuania. In indepen-

dent LATVIA (1918–40), Courland was divided into two provinces, Kurzeme and Zemgale.

Courland Lagoon: see KURSKY ZALIV, USSR

Cournand, André Frederic (kōōr'nānd), 1895–, American physician and physiologist, b. France, B.A. Sorbonne, 1913, M.D. Univ. of Paris, 1930. He emigrated to the United States in 1930 and was naturalized in 1941. He was associated with the College of Physicians and Surgeons, Columbia, after 1935 and became a full professor in 1951. He shared with Werner Forssmann and Dickinson W. Richards the 1956 Nobel Prize in Physiology and Medicine for work in developing cardiac catheterization. This technique, whereby a catheter is inserted through a vein into the heart, facilitates study of both the diseased and healthy heart and, in many cases, aids in determining the advisability of heart surgery.

Cournot, Antoine Augustin (āntwān' ōgustān' kōōrnō'), 1801–77, French mathematician and economist. He developed mathematical theories of chance and probability and was one of the first to attempt the application of mathematics to economic problems. His writings include *Researches into the Mathematical Principles of the Theory of Wealth* (1838, tr. 1897).

Courrèges, André see under FASHION

Court, Antoine (āntwān' kōōr), 1696–1760, French Protestant preacher, called the Restorer of Protestantism in France. He was successful in reorganizing the remnants of the persecuted Calvinists in France. With a price on his head, he escaped to Lausanne in 1730, where he spent the remainder of his life directing the theological seminary that he founded.

Court, Margaret, 1942–, Australian tennis player. Playing tennis from age eight, she rose to prominence in the game in the early 1960s under her original name, Margaret Smith. Ranked first in world standings six times since 1962, she retired in 1966, but returned to the game after marriage in 1968, and in 1970 became the second woman (Maureen Connolly was the first) to win the grand slam. In 1973 she was defeated by Bobby RIGGS in a nationally televised match but went on to win her fifth U.S. Open championship later that year. See *The Margaret Smith Story* written with Don Lawrence (1965).

court, in law, official body charged with administering justice. The term is also applied to the judge or judges who fill the office and to the courtroom. Distinct courts originate when legal relations are no longer entirely a private matter. Thus, courts do not exist in a society governed by VENDETTA, and they are of little consequence in one where COMPOSITION for wrongs is the rule. The most ancient courts known, e.g., those of Egypt and Babylonia, were semiclerical institutions that used religious rituals in deciding issues. In Greece the functions of a court were chiefly undertaken by assemblies of the people that heard the arguments of orators. In Rome there was a clear evolution of the court system from priestly beginnings to a wholly secular, hierarchical organization staffed by professional jurists (see ROMAN LAW). Western Europe (after the collapse of Rome) and Anglo-Saxon England had mainly feudal courts of limited territorial authority, administering customary law, which differed in each locale. In England, after the Norman Conquest (1066), royal authority was gradually extended over the feudal lords, and by the early 13th cent., although purely local courts had not been abolished, there was established the supremacy of the central courts that had evolved from the Curia Regis [Lat. = king's court], namely, the Court of EXCHEQUER, the Court of Common Pleas, and King's Bench. The Court of Common Pleas heard cases between ordinary subjects of the king, while King's Bench acted as a court of appeals and heard cases involving persons of high rank. Soon itinerant royal courts were established to spare civil litigants the labor and expense of going to the capital at Westminster and to afford hearings to persons held on criminal charges in county jails. By the 14th cent. the principal function of the central courts was to hear appeals from the circuit courts. Unity was at least temporarily disrupted by the emergence (16th cent.) of EQUITY as a distinctive body of law administered by the chancery. The conflict of jurisdiction continued to some extent until 1875, when the Judicature Act of 1873 went into effect. It provided for a supreme court of judicature, comprising the high court of justice and the court of appeal. The high court of justice (with jurisdiction over England, Wales, and Northern Ireland) is divided, purely for administrative purposes, into three divisions: chancery, probate, divorce, and admiralty, and King's (or Queen's) Bench. Appeals may in some instances be taken from the court of

appeals to the House of Lords. The judicial committee of the privy council hears appeals from overseas territories still under British domain and from Commonwealth countries. In the United States there are two distinct systems of courts, Federal and state. Each is supreme in its own sphere, but if a matter simultaneously affects the states and the Federal government, the Federal courts have the decisive power. The district court is the lowest Federal court. Each state constitutes at least one district, and some of the more populous states contain as many as four districts. There are 10 circuit courts of appeals (each with jurisdiction over a definite territory) and a court of appeals for the District of Columbia, these hear appeals from the district courts. There are, in addition, various specialized Federal courts, including the Court of Tax Appeals and the Court of Claims. Heading the Federal court system is the U.S. SUPREME COURT. The court systems of the states vary to some degree. At the bottom of a typical structure are local courts that only have authority in specific jurisdiction (e.g., court of the justice of the peace, POLICE COURT, and court of PROBATE). County courts, or the equivalent, exercising general criminal and civil jurisdiction, are on the next level. All states have a highest court of appeals, and some also have intermediate appellate courts. In a few states separate courts of equity persist. In addition to law courts there are ecclesiastical courts, arbitral tribunals (e.g., for labor cases), administrative tribunals (e.g., of the Interstate Commerce Commission), and courts-martial (see MILITARY LAW). See CONFLICT OF LAWS. See Harold Potter, *Historical Introduction to English Law and Its Institutions* (4th ed. 1958, repr. 1969), Lewis Mayers, *The American Legal System* (rev. ed. 1964), R. M. Jackson, *The Machinery of Justice in England* (5th ed. 1967), H. J. Abraham, *The Judicial Process* (2d ed. 1968), Herbert Jacob, *Justice in America* (2d ed. 1972).

Courteline, Georges (zhôrzh kôor'talên'), 1858-1929, French writer. His prolific humorous and satirical works include sketches, plays, tales, and novels. Bourgeois attitudes are ridiculed in his comedy *Boubouroche* (1892, tr. 1961), official red tape is satirized in his sketches *Messieurs les ronds-de-cuir* (1893, tr. *The Bureaucrats*, 1928), and the pitfalls of justice in the courts are hilariously exposed in *Hortense, couche-toi* (1897, tr. *Hold on, Hortense*, 1961) and *L'Article 330* (1900, tr. 1961).

Courtenay, William (kôrt'nê), c.1342-1396, English prelate, archbishop of Canterbury (1381-96). He was important for his condemnation of the doctrines of Wyclif and for suppressing the Lollards.

courtly love, philosophy of love and code of love-making that flourished in France and England during the Middle Ages. Although its origins are obscure, it probably derived from the works of Ovid, various Oriental ideas popular at the time, and the songs of the troubadours. According to the code, a man falls passionately in love with a married woman of equal or higher rank. Before his love can be declared, he must suffer long months of silence, before it can be consummated, he must prove his devotion by noble service and daring exploits. The lovers eventually pledge themselves to secrecy and to remain faithful despite all obstacles. In reality, courtly love was little more than a set of rules for committing adultery. It was more important as a literary invention, expressed in such works as Chretien de Troyes's *Lancelot* (12th cent.), Guillaume de Lorris's *Roman de la Rose* (13th cent.), and Chaucer's *Troilus and Cnseyde* (14th cent.). In these works it was the subjective presentation of the lovers' passion for each other and their consideration for other people that transformed the code of courtly love into one of the most important literary influences in Western culture. See CHIVALRY. See Denis de Rougemont, *Love in the Western World* (tr. 1956), C. S. Lewis, *The Allegory of Love* (1936, repr. 1958).

courts of love: see CHIVALRY and COURTLY LOVE

court system in the United States, judicial branches of the Federal and state governments charged with the application and interpretation of the law. The U.S. court system is unique in that it is divided into two administratively separate systems, the Federal and the state, each of which is independent of the executive and legislative branches of government. Such a dual court system is a heritage of the colonial period. By the time the U.S. Constitution had first mandated (1789) the establishment of a Federal judiciary, each of the original Thirteen Colonies already had its own comprehensive court

system based on the English model. Thus, the two systems grew side by side and came to exercise exclusive jurisdiction in some areas and overlapping, or concurrent, jurisdiction in others. Of the two systems, the Federal is by far the less complicated. According to Article III of the Constitution, "The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish." In accordance with this directive, the Federal judiciary is divided into three main levels. At the bottom are the Federal district courts, which have original jurisdiction in most cases of Federal law. Made up of 91 districts, the Federal district court system has at least one bench in each of the 50 states, as well as one each in the District of Columbia and Puerto Rico. There are from 1 to 24 judges in each district, and, as with most Federal jurists, district court judges are appointed by the President and serve for life. Cases handled by the Federal district courts include those relating to alleged violations of the Constitution or other Federal laws, maritime disputes, cases directly involving a state or the Federal government, and cases in which foreign governments, citizens of foreign countries, or citizens of two or more different states are involved. Directly above the district courts are the United States courts of appeals, each made up of one or more district courts. Established by Congress in 1891, the court of appeals system is composed of 10 judicial circuits throughout the 50 states plus one in the District of Columbia. There are from three to nine judges in each circuit. In addition to hearing appeals from their respective district courts, the courts of appeals have original jurisdiction in cases involving a challenge to an order of a Federal regulatory agency, such as the Securities and Exchange Commission. The highest level court in the Federal system is the Supreme Court of the United States, the only Federal court explicitly mandated by the Constitution. Since 1869 it has been composed of one Chief Justice and eight Associate Justices. The Supreme Court sits in Washington, D.C., and has final jurisdiction on all cases that it hears. The high court may review decisions made by the U.S. courts of appeals, and it may also choose to hear appeals from state appellate courts if a Constitutional or other Federal issue is involved. The Supreme Court has original jurisdiction in a limited number of cases, including those that involve high-ranking diplomats of other nations. In addition the Federal judiciary maintains a group of courts that handle certain limited types of disputes. Included among such special Federal courts are the U.S. court of claims, which adjudicates claims against the U.S. government, and the U.S. customs court, which passes upon customs disputes. Special court judges, unlike those in the three main levels of the Federal judiciary, do not serve for life. The U.S. armed forces have courts-martial for cases involving military personnel (see MILITARY LAW). The system of state courts is quite diverse, virtually no two states have identical judiciaries. In general, however, the states, like the Federal government, have a hierarchically organized system of general courts along with a group of special courts. The lowest level of state courts, often known generically as the inferior courts, may include any of the following: magistrate court, municipal court, justice of the peace court, police court, traffic court, and county court. Such tribunals, often quite informal, handle only minor civil and criminal cases. More serious offenses are heard in superior court, also known as state district court, circuit court, and by a variety of other names. The superior courts, usually organized by counties, hear appeals from the inferior courts and have original jurisdiction over major civil suits and serious crimes such as grand larceny. It is here that most of the nation's jury trials occur. The highest state court, usually called either appellate court, state court of appeals, or state supreme court, generally hears appeals from the state superior courts and, in some instances, has original jurisdiction over particularly important cases. A number of the larger states, such as New York, also have appellate courts that are intermediate between the superior courts and the state's highest court. Additionally, a state may have any of a wide variety of special tribunals, usually on the inferior court level, including juvenile court, divorce court, probate court, family court, and small claims court. In all, there are more than 1,000 state courts of all different types, and their judges, who may be either appointed or elected, handle the overwhelming majority of trials held in the United States each year.

court tennis, indoor racket and net game of ancient origin. It is believed to have originated (about the 14th cent.) in medieval France and is the forerunner of most modern racket games. In its early days the sport was known as royal tennis because of the interest it held for French and English royalty. Enjoying varying degrees of popularity over the years, the sport was first played in the United States in 1876. Court tennis is played on an indoor, cement court 110 ft by 38 ft (33.53 m by 11.58 m), which is surrounded by four walls 30 ft (9.14 m) high. A player hits the ball—made of tightly wound cloth—with a 16-oz (45-kg), 27-in (68.5-cm) racket over the center net and plays the surface of the floor, the walls, and the ceiling to put the ball out of reach of the opponent. The scoring is intricate, and hitting the ball into wall openings also wins points. See Allison Danzig, *The Racquet Game* (1930).

Coushatta Indians: see ALABAMA INDIANS

Cousin, Jean (zhaN kôözän'), c.1490-c.1560, celebrated French painter, designer, and sculptor. To him have been attributed the designs for the windows of various churches of Sens and Paris and a painting, *Eva Prima Pandora* (Louvre). He also designed tapestries for the Cathedral of Langres. Much of his work has been confused with that of his son Jean Cousin, c.1522-c.1594, who also designed stained glass. He illustrated the *Livre de fortune* (1568), and engravings of Ovid's *Metamorphoses* (1570) have been attributed to him. The influence of mannerism is apparent in his principal surviving painting, *The Last Judgment* (Louvre).

Cousin, Victor (vêktôr'), 1792-1867, French educational leader and philosopher, founder of the eclectic school. He lectured at the Sorbonne from 1814 until 1821, when political reaction forced him to leave. Recalled to teaching in 1828, Cousin was named in 1830 to the council of public instruction and was made councillor of state. In 1832 he became a peer of France, and in 1840 he accepted the position of minister of public instruction. He became virtually the national arbiter of educational and philosophical matters. His chief works in education were the complete reorganization and centralization of the primary system and the establishment of a policy of philosophical freedom in the universities. As an eclectic, Cousin sought to develop a system that combined the psychological insights of Maine de Biran, the common sense of the Scottish school, and the idealism of Hegel and Schelling. He argued that each of these philosophies contains an element of truth that can be grasped by intuition. Cousin's approach to philosophy was historical, and he introduced the study of the history of philosophy into the French academic course. His works include *Fragments philosophiques* (1826), *Du vrai, du beau et du bien* (1836, tr. *Lectures on the True, the Beautiful, and the Good*, 1854), *Cours de l'histoire de la philosophie* (8 vol., 1815-29), various studies of educational systems, and a brilliant translation of Plato. See George Boas, *French Philosophies of the Romantic Period* (1925), W. V. Brewer, *Victor Cousin as a Comparative Educator* (1971).

Cousin-Montauban, Charles Guillaume Marie: see PALUKAO CHARLES GUILLAUME

Cousins, Samuel, 1801-87, English mezzotint engraver. He is famous for his interpretations in mezzotint of the work of Sir Thomas Lawrence, but his plates, over 200 in number, also include reproductions of the work of Thomas Gainsborough, Sir Joshua Reynolds, Sir John Millars, and Sir Edwin Landseer. See biography by Alfred Whitman (1904).

Cousteau, Jacques Yves (zhak êv kôöstô'), 1910-, French naval officer. In 1943, with Émil Gagnan, he invented the self-contained underwater breathing apparatus (scuba), or aqualung. He founded (1945) the French navy's undersea research group and in 1957 was made director of the oceanographic museum of Monaco. He also helped develop the bathyscaphe. Since 1951 he has gone on annual oceanographic expeditions and has written numerous books and made several documentary films recording his trips. His publications include *The Silent World* (with Frédéric Dumas, 1953), *The Living Sea* (with James Dugan, 1963), *World Without Sun* (ed. by James Dugan, 1965), *The Shark* (with Philippe Cousteau, 1970), *Life and Death in a Coral Sea* (with Philippe Diolé, 1971), and *The Whale* (with Philippe Diolé, 1972). Among his films are *World Without Sun* (1964), *Desert Whales* (1970), and *Tragedy of Red Salmon* (1970).

Coustou (kôöstô'), family of French sculptors. Nicolas Coustou, 1658-1733, studied with his uncle, Antoine Coysevox, with whom he later collaborated on the decorations at Marly and at Versailles. He

became rector and chancellor of the Académie royale. Among his best-known works are *La Seine et la Marne* (Tuileries Gardens) and the bas-relief, *Passage du Rhin* (Louvre). His brother, **Guillaume Cous-tou**, 1677-1746, also studied with Coysevox and in Rome. Returning to Paris, he worked at Versailles and at Marly. He is famous for his colossal group, *The Ocean and the Mediterranean*, at Marly, and above all for his exuberant *Horses of Marly* at the entrance of the Champs Élysées, Paris. His son **Guillaume Coustou**, the younger, 1716-77, was also a noted sculptor.

Cousy, Robert Joseph (kōō'zē), 1928-, American basketball player, b. New York City. He compiled an outstanding record with the Boston Celtics in the National Basketball Association (NBA). He was the league's finest backcourt player, a brilliant playmaker, and a leading scorer. He was chosen for the NBA all-star squad for 10 straight years and played in 12 all-star games. After his retirement in 1963 he was basketball coach at Boston College (1963-69) and then coach of the NBA's Cincinnati Royals (later the Kansas City-Omaha Kings, 1969-73).

Coutchiching (kōō'chiching') see PRECAMBRIAN ERA.

Couthon, Georges (zhōrzh kōōtōN'), 1755?-1794, French revolutionary. An able lawyer, he was elected to the Legislative Assembly (1791) and to the Convention (1792). He became (1793) an important member of the Committee of Public Safety, the dictatorial body that ruled France in 1793 and 1794 under Maximilien ROBESPIERRE. He generally supported Robespierre in the REIGN OF TERROR. Although partially paralyzed, he led the army that took (1793) Lyons from the counterrevolutionists. As commissioner there he proved most humane, in contrast with his successor Jean Marie Collot d'Herbois. Couthon fell with Robespierre in the coup d'état of 9 THERMIDOR (July 27, 1794) and was guillotined.

Couture, Thomas (tōmā' kōōtur'), 1815-1879, French academic painter. He was a pupil of Gros and Delacroix. He achieved fame with his vast orgy painting, *Romans in the Decadence of the Empire* (1847, Louvre). Acquiring a great reputation as a teacher, he wrote two treatises on painting. Puvion de Chavannes, Manet, and Fantin-Latour worked in his studio at various times.

couvade (kōōvad'), imitation by the father of many of the concomitants of childbirth, at the time of his wife's parturition. The father may go to bed, retire into seclusion, and observe taboos and restrictions. Among the theories that have been advanced to account for the couvade is that during this period, the father has to be cautious to avoid an injury that could be transmitted to the baby by sympathetic magic. Another is that the father asserts his paternity by appearing to take part in the delivery. A third explanation is that the father simulates the wife's activities in order to get evil spirits to focus on him rather than her. In extreme form, men may mimic the pain and process of childbirth. The practice of couvade has been noted since antiquity into modern times and in such widely dispersed places as Africa, China, Japan, India, and among the Indians of both North and South America.

Couve de Murville, Maurice (mōrēs' kōōv də mūrvel'), 1907-, French politician and diplomat. An expert in public finance, he entered the diplomatic service after World War II, serving as ambassador to Egypt, the United States, and West Germany. As minister of foreign affairs in Charles de Gaulle's administration (1958-68), he pursued the Gaullist policy of keeping France out of NATO military operations and preventing Great Britain from becoming a member of the Common Market. He served briefly as finance minister (May-July, 1968) and then as premier until June, 1969.

Couzens, James (kūz'anz), 1872-1936, U.S. Senator, industrialist, and philanthropist, b. Ontario, Canada. He moved (1887) to Detroit, and after he entered (1903) into partnership with Henry Ford, he became vice president and general manager of the Ford Motor Company. In 1919 he sold his interests to the Fords for \$35 million. As mayor (1919-22) of Detroit, Couzens installed municipal street railways. Serving (1922-36) in the U.S. Senate, he acted with the Progressive Republicans, advocating such measures as high, graduated income taxes and public ownership of utilities. He established the Children's Fund of Michigan with \$10 million, gave \$1 million for relief in Detroit, and began a loan fund for the physically handicapped. His support of the New Deal cost him (1936) the senatorial renomination. See biography by Harry Barnard (1958).

Covadonga (kō'vathōn'ga), village, Oviedo prov., N Spain, in Asturias. A battle fought nearby sometime between 718 and 725 was the first victory of the Christians over the Moors, it had great symbolic significance in the Christian reconquest of Spain. The village attracts many tourists. Legend says that a cave near Covadonga was the refuge of King PELAYO. The cave's chapel dates from the 8th cent.

covalent bond (kō'vālānt) see CHEMICAL BOND.

Covarrubias, Miguel (mēgāl' kōvar-rōō'bēas), 1902-1957, American artist and writer, b. Mexico City. Largely self-taught, he went to New York City in 1923 and won prompt recognition as a brilliant illustrator, stage designer, and caricaturist. His drawings and caricatures for *Vanity Fair* and the *New Yorker* are superb examples of his early work. He also was a noted muralist and lithographer. In the late 1920s he became interested in ethnology. His first major book, *The Island of Bali*, appeared in 1937. He later wrote three excellent studies of the life and art of the American Indians, *Mexico South* (1946), *The Eagle, the Jaguar, and the Serpent* (1954), and *Indian Art of Mexico and Central America* (1957).

covenant (kūv'anant), agreement entered into voluntarily by two or more parties to do or refrain from doing certain acts. In the Bible and in theology the covenant is the agreement or engagement of God with man as revealed in the Scriptures. In law a covenant is a contract under seal or an agreement by deed. In Scottish history the various pacts among the religious opponents of episcopacy were called covenants, those who agreed to the pacts were the COVENANTERS. The idea of the covenant between God of Israel and His people is fundamental to the religion of the Old Testament. God promised man specific good if man gave God the obedience and love due Him. In the covenant of God and Noah, He agreed never again to destroy man by a flood and set the rainbow in the sky as the sign of the covenant. Gen. 9. The covenants with Abraham, Isaac, and Jacob established Israel as God's chosen people and promised Canaan to them. Gen. 17, 26:1-5, 28:10-15, 32:24-32. The culmination of God's covenants with Israel comes in His promises and delivery of the Law of Moses. This provides the theme of Exodus, Leviticus, Numbers, and Deuteronomy. The great covenant with Israel is called in Christian theology the Old Covenant, because Jesus is believed to have come to fulfill it and set up a new and better covenant. Mat. 5:17, 18, Gal. 4, Heb. 8-10. This theology is behind the conventional names of the two parts of the Bible, for testament in the expressions "Old Testament" and "New Testament" is derived from a Latin mistranslation of a Greek word used in the Septuagint for covenant. In Protestant theology the covenant is especially prominent in the teaching of Johannes COCCIEUS. In English common law, covenants are agreements entered into by deed. One of the parties promises to perform or not to perform certain acts, or states that something has or will be done, or has not or will not be done. Covenants are bound by the same rules as other contracts and are variously classified. There are affirmative, alternative, auxiliary, collateral, concurrent, declarative, dependent, executory, express, and independent covenants, and covenants in law are covenants for title, covenants of seizin, covenants of warranty, and others. The express promise contained in a covenant is its most characteristic feature and distinguishes it from a bond, which is a simple record of indebtedness. The sealing and delivery of a covenant is an essential element of its validity. The covenantor is the party bound to perform the stipulation of a covenant, the covenantee is the party in whose favor the covenant is made.

Covenanters (kāvānān'tarz), in Scottish history, groups of Presbyterians bound by oath to sustain each other in the defense of their religion. The first formal Covenant was signed in 1557, signaling the beginning of the Protestant effort to seize power in Scotland. It was renewed thereafter at times of crisis, most notably in the 17th cent. The National Covenant of 1638 aimed to unite the Scots in opposition to the episcopal innovations of King Charles I and William LAUD, especially the use of the English Book of Common Prayer. The Covenanters successfully resisted the king's armies in the BISHOPS' WARS (1639-40). In the ENGLISH CIVIL WAR they supported the parliamentary party only after the English Parliament had accepted (1643) the Solemn League and Covenant, which provided for the establishment of a Presbyterian state church in England and Ireland as well as in Scotland. After the first civil war, however, the Independents in the English army secured control of affairs and prevented implementation of the

Covenant. The Scots, therefore, concluded the agreement known as the "Engagement" with Charles I, by which the king agreed to establish Presbyterianism in England if restored to the throne. As a result, the Covenanters fought for Charles I in the second civil war and, after his execution (1649), they fought for Charles II, who also subscribed (1650) to the Solemn League and Covenant. They were subdued, however, by Oliver Cromwell's conquest of Scotland (1650-51). After the Restoration (1660), Charles II resumed his father's effort to impose episcopacy in Scotland. The Covenanters were subjected to alternate attempts to conciliate them and to hunt them down. The result was a series of new compacts of resistance among them and new attempts to suppress them. A rebellion in 1679, which culminated in a rout at Bothwell Bridge, was met with harsh repression, as was the resistance of Richard CAMERON and his followers, who issued the Sanquhar Declaration in 1680. The troubles ended with the Glorious Revolution of 1688, which restored the Presbyterian Church in Scotland. See studies by J. K. Hewison (1908) and J. D. Douglas (1964).

Covent Garden (kūv'ənt), area in London containing the city's principal fruit and garden market and the Royal Opera. The market was established in 1671 by Charles II on the site of the abbot of Westminster's convent garden, from which the present area's name is derived. In 1974 the entire market was removed to a new site at Nine Elms on the South Bank of the Thames near Vauxhall. The Royal Opera was erected on the site of the Theatre Royal built in 1732 by John RICH and later managed by the KEMBLE family. After being repaired and enlarged in 1787, the theater burned down in 1808 and was replaced, only to burn down again in 1856. It was rebuilt in 1858 to house opera and ballet. The Royal Ballet began performing at the Royal Opera in the spring of 1946. See studies by E. B. Chancellor (1930), Harold Rosenthal (1958), and Clemence Dane (1964).

Coventry (kōv'əntre), county borough (1971 pop. 334,839), Warwickshire, central England. It is an industrial center noted for automobile production, tractors, airplanes, machine tools, synthetic textiles, electrical equipment, and engineering products are also made. Lady GODIVA and her husband founded a Benedictine abbey in the town in 1043. By the 14th cent. Coventry, a flourishing market and textile-weaving town, was one of the five largest towns in England. The entire central portion of Coventry, including the 14th-century Cathedral of St. Michael, was destroyed in an 11-hour air raid in Nov., 1940. A new cathedral, alongside the ruins of the old one, was completed in 1962. Of interest are a statue of Lady Godiva, St. Mary's Hall (1340-42, with 15th-century additions), Holy Trinity Church (13th cent.), with a spire 237 ft (72 m) high, the spire (230 ft/70 m high) of Christ Church, and Ford's Hospital, a restored Tudor almshouse. Coventry's educational institutions include the Univ. of Warwick, Lancaster College of Technology, Coventry College—a teacher training school, and two old public schools. In 1974, Coventry became part of the new metropolitan county of West Midlands.

Coventry, town (1970 pop. 22,947), Kent co., W. R. I., settled 1643, set off from Warwick and inc. 1741. Formerly a noted lace center, it still has textile industries, but today glass, chemicals, and pharmaceuticals are also important. Coventry's many historic structures include the Payne house (1668) and Nathanael Greene's homestead (1770).

Coventry Plays: see MIRACLE PLAY.

cover crop, green temporary crop grown to prevent or reduce erosion and to improve the soil by building up its organic content. Green-manure crops are usually classed as cover crops. In orchards a cover crop is sometimes used to check the growth of some fruits when they reach maturity by supplying a plant that will compete with the tree for the nutrient in the soil. Cover crops are often the first means used to rehabilitate land that has become run down as the result of poor farming practices and neglect. Leguminous plants (e.g., clovers, vetches, and soybeans) and nonleguminous (e.g., rye, barley, wheat, and turnips) are used. See CATCH CROP.

Coverdale, Miles, 1488-1569, English translator of the Bible, educated at Cambridge. Coverdale was ordained (1514) and entered the house of Augustinian friars at Cambridge. He became an advocate of ecclesiastical reform, and his preaching against confession and images forced him to reside abroad. In 1535, Coverdale published an English translation of the entire Bible, probably largely with the aid of German versions, Tyndale's Pentateuch and New

Testament, and the Vulgate. He was a principal collaborator in the Great Bible (1539) and edited that of 1540, known as Cranmer's Bible. On the fall (1540) of Thomas Cromwell, Coverdale again went to the Continent, but he returned (1548) and enjoyed high favor under Edward VI, serving as bishop of Exeter from 1551 to 1553. On Mary's accession he lost his bishopric and again left England. After Elizabeth's succession, he resumed his life in England, where he was widely known for his eloquent sermons and addresses. Coverdale was rector of St Magnus, London Bridge, from 1563 to 1566. See his writings and letters (ed. by George Pearson, 2 vol., 1844-46), Henry Guppy, *Miles Coverdale and the English Bible* (1935).

covered wagon: see CONESTOGA WAGON, PRAIRIE SCHOONER

Covilhã (kõõvêlyãN'), town (1970 municipal pop. 60,768), E central Portugal, in Beira Baixa. It had a famous fair in medieval times and is still a trade center as well as a textile milling town.

Covina (kõvê'nã), city (1970 pop. 30,380), Los Angeles co., S Calif., inc. 1901. Citrus fruits are processed, and medical supplies and fabricated-metal products are made. The area was settled in 1842, citrus crops were introduced in 1886, and the citrus industry reached its peak in the 1930s when Covina was one of the world's largest producers.

Covington. 1 City (1970 pop. 10,267), seat of Newton co., N central Ga., inc. 1854. It is a processing and market center in a cotton area. Natural and synthetic textiles are manufactured in the city. Points of interest include antebellum homes spared by Sherman in his march (1864) to the sea. 2 City (1970 pop. 52,535), seat of Kenton co., N central Ky., at the confluence of the Ohio and Licking rivers, inc. 1815. It is an industrial center, connected by bridges with Cincinnati across the Ohio and Newton across the Licking. There are tobacco and meat-packing establishments and plants making a great variety of products, including paper, sheet metal, metal fabricators, machine tools, and electrical equipment. A ferry and a tavern were established there c. 1801, and the city was first settled in 1812. Among its points of interest are the suspension bridge to Cincinnati (designed by) A. Roebling), Devou Park, with a museum of natural history, Cathedral Basilica of the Assumption, the tiny Monte Casino chapel, the Garden of Hope, and the Carneal House (1815). Frank Duveneck was born in Covington, and the city has a museum devoted to his paintings. The artist and naturalist Daniel Carter Beard was also born in Covington and lived there. Thomas More College (formerly Villa Madonna College) is in nearby Fort Mitchell. The greater Cincinnati airport is also in the area. 3 City (1970 pop. 10,060), seat of Allegheny co. but politically independent, W central Va., near the W. Va. line, on the Jackson River in a valley surrounded by mountains, laid out 1819, inc. as a city 1952. Paper, furniture, chemical fibers, and film are manufactured in Covington. Nearby Humpback Bridge (built 1835, used until 1929) is the only covered bridge of its construction left in the United States. There is excellent hunting and fishing in the area, and a state park is nearby.

cow: see CATTLE DAIRYING

Cowansville, town (1971 pop. 11,920), S Que., Canada, on the Yamaska River, SE of Montreal. It is a manufacturing town producing textiles, furniture, electronic equipment, and chemicals.

Coward, Sir Noel, 1899-1973, English playwright, actor, composer, and director, b. Teddington. Onstage from the age of 12, Coward gained prominence in 1924 acting in his *Vortex*. His name soon became synonymous with urbanity, sophistication, incomparable wit, and a certain sentimentality. The characters in his 27 plays are usually rich, vain, spoiled, and snobbish couples, who express themselves with a brittle badinage that covers the suffering they undergo together or apart. Coward's success was such that five of his plays were hits in London in 1925. The best-known of his theater works include *Fallen Angels* (1925), *Hay Fever* (1925), *Easy Virtue* (1925), *Private Lives* (1930), *Cavalcade* (1931), *Design for Living* (1932), *Conversation Piece* (1934), and *Blithe Spirit* (1941). He also wrote revues, sketches, musical comedies, operettas, and 281 songs. His major films include the romantic masterpiece *Brief Encounter* (1946) and the patriotic film *In Which We Serve* (1942), for which he was director, actor, and producer. Coward wrote short stories and a novel, *Pomp and Circumstance* (1960), performed in cabaret, made recordings, and wrote three autobiographical works, *Present Indicative* (1937), *Middle East Diary* (1945), and *Future Indefi-*

nite (1954). His *Song at Twilight* (1966) is an autobiographical drama about the agony of an aging homosexual writer who has had to write dishonestly about himself. The play initiated a tremendous revival of interest in Coward's works. See biographies by Robert Greacen (1954), Sheridan Morley (1969), and Charles Castle (1973).

cowbird, New World bird of the blackbird and oriole (hangnest) family. The male eastern, or common, cowbird is glossy black, about 8 in. (20 cm) long, with a brown head and breast, the female is gray. Most cowbirds lay their eggs in the nests of smaller bird species, victimizing especially vireos, sparrows, and flycatchers. Sometimes the alien egg is ejected or buried under a new nest floor or the nest is abandoned, but usually the host bird incubates the egg and feeds the voracious intruder while its smaller offspring are starved or crowded out. Cowbirds eat seeds but feed chiefly on insects, following behind grazing cattle in order to capture the insects stirred up in this way—hence the name *cowbird* and the earlier name *buffalo bird*. Related birds are the bronzed, the California, the dwarf, the Nevada, and the red-eyed cowbirds. Cowbirds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Icteridae.

cowboys, in American history. 1 Tory marauders, adherents to the British cause in the American Revolution, who fought in the contested area of Westchester co., N.Y. Their opposite numbers, who favored the Revolutionary cause and who operated in the same territory at the same period, were called *skinnners*. 2 Mounted men employed as herders on cattle ranches of the American West. They were more important and picturesque in the days before the vast ranches were fenced, when their duties consisted of driving cattle to pasture and water, branding them at the roundup, protecting them from wild animals and thieves, and driving them to the shipping point. See RODEO. See Emerson Hough, *The Story of the Cowboy* (1897, repr. 1970), J. B. Frantz and J. E. Choate, Jr., *The American Cowboy, the Myth and the Reality* (1955, repr. 1968), John A. Lomax and Alan Lomax, *Cowboy Songs and Other Frontier Ballads* (rev. ed. 1966).

Cowell, Henry Dixon, 1897-1965, American composer and pianist, b. Menlo Park, Calif., largely self-educated, studied musicology in Berlin (1931-32). He experimented with new musical resources, in his piano compositions he introduced the tone cluster, played with the arm or the fist, and wrote compositions to be played directly on the strings of the piano. Cowell founded (1927) *New Music*, a quarterly for the publication of music by contemporary American and European composers. In 1932, with the help of Leon Theremin, he invented the rhythmicon, a device that produces various rhythms and cross-rhythms mechanically, for which he wrote a concerto (1932). An interest in counterpoint produced the five *Hymns and Fuguing Tunes* (1941-45). He also wrote symphonies, piano pieces, band music, and vocal and chamber music, and edited *American Composers on American Music* (1933). See his *New Musical Resources* (1930, repr. 1969).

Cowes (kouz), urban district (1971 pop. 18,895), Isle of Wight, S England. A resort town with lovely promenades, it is also the main port of the island and the center for yachting in the British Isles. Cowes became the headquarters of the Royal Yacht Club in 1838, and fashionable regattas are held annually. Industries include shipbuilding and aircraft works. Queen Victoria died in Osborne House in East Cowes. In 1974, Cowes became part of the new nonmetropolitan county of Isle of Wight.

cowfish: see TRUNKFISH

Cowl, Jane, 1890-1950, American actress, playwright, and producer, b. Boston, Mass. Cowl's stage career began in 1903 with *Sweet Kitty Bellairs*. Between 1917 and 1935 she was a leading lady nearly every season, appearing in *The Road to Rome*, *Romeo and Juliet*, *Lilac Time*, and *Smilin' Through*, among others. Cowl coauthored six successful plays and performed on radio, in films (e.g., *The Garden of Lies*, 1915, and *Payment on Demand*, 1950), and on television.

Cowley, Abraham (kõd'le, kou'-), 1618-67, one of the English METAPHYSICAL POETS. He published his first volume of verse, *Poetical Blossoms* (1633), when he was 15. While a student at Cambridge, Cowley wrote three plays and began the scriptural epic *Davidis* (1656), in which he developed the use of the couplet as a vehicle for narrative verse. As a result of the Puritan uprising he left Cambridge and in 1656 went to France, where he served as secretary

and royalist agent for Queen Henrietta Maria. Cowley's principal works include *The Mistress* (1647), a love cycle written in the manner of John Donne, *Poems* (1656), including the Pindaric odes and the elegies on Richard Crashaw and William Hervey, and *Verses on Several Occasions* (1663), including "To the Royal Society," an ode recalling his earlier prose tract *Proposition for the Advancement of Experimental Philosophy* (1661). See Samuel Johnson's essay in *Lives of the English Poets* (1778), biographies by A. H. Nethercot (1931, repr. 1967) and J. G. Taaffe (1972), study by R. B. Hinman (1960).

Cowley, Hannah, 1743-1809, English poet and dramatist. One of the DELLA-CRUSCANS, she contributed under the name Alma Matilda sentimental verse to the *World*. Her most successful comedy was *The Belle's Stratagem* (produced in 1780).

Cowley, Malcolm (kou'le), 1898-, American critic and poet, b. Beltsville, Pa., grad. Harvard, 1920. He lived abroad in the 1920s and knew many writers of the "lost generation," about whom he wrote in *Exile's Return* (1934) and *Second Flowering* (1973). For many years he wrote a book-review column for the *New Republic*. His works include *The Blue Juniata* (1927) and *A Dry Season* (1942), poems, *The Literary Situation* (1954), a critical analysis, and *Many Windowed Houses: Collected Essays on Writers and Writing* (1970).

cow lily: see WATER LILY

Cowloon: see HONG KONG

cowpea, black-eyed pea, or black-eyed bean, annual leguminous plant (*Vigna sinensis*) of the family Leguminosae (PULSE family). Native to the Old World, it was introduced in the early 18th cent. to the United States, where it is now much used in Southern cooking and, especially, as a CATCH CROP and a major forage plant. The cowpea is also grown commercially in India and China and is sometimes called China bean. Cowpeas are classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Rosales, family Leguminosae.

Cowpens National Battlefield: see NATIONAL PARKS AND MONUMENTS (table)

Cowper, William (kõd'pär, kou'-), 1731-1800, English poet. Physically and emotionally unfit for the professional life, he was admitted to the bar but never practiced. After a battle with insanity, Cowper retired to the country, taking refuge with the family of Mrs. Mary Unwin, whose life-long devotion to him he celebrates in "To Mary." Most of his country life was spent at Olney, where he met John Newton, the ardent evangelical preacher. He contributed to Newton's *Olney Hymns* (1779) several poems, including the two commencing "Oh for a closer walk with God" and "God moves in a mysterious way." His hymns, while expressing the hope of the new humanitarian religious revival, often gave way to religious despair and self-distrust. After Newton left Olney, Cowper, having recovered from another period of insanity, turned to writing about simple homely subjects, producing his famous long poem, *The Task* (1785). Its descriptions of the sights and sounds of country life foreshadowed 19th-century romanticism. Cowper's sweet-tempered, playful moods found a way into many of his poems, the most notable being "The Diverting History of John Gilpin." He also made a relatively unsuccessful translation of Homer (1791). After the death of Mrs. Unwin in 1796, his old malady returned, and he wrote little except the anguished poem, "The Castaway." His letters are considered among the most brilliant in English literature. See his verse and letters selected by B. Spiller (1968), biography by D. Cecil (1947), study by J. A. Roy (1914, repr. 1972).

Cowper, William Cowper, 1st Earl (kõd'pär), 1664?-1723, English jurist. He became lord keeper of the great seal in 1705 and in 1706 took a leading part in negotiating the union of England with Scotland. He was the first lord chancellor of Great Britain (1707-10), and presided at the trial of Henry Sacheverell, though he disapproved the action. He was forced out of office with the Whigs in 1710. Cowper wrote (1714) a tract on political parties to convince George I that the Whigs alone were loyal to the Glorious Revolution and the Act of Settlement. He was lord chancellor again (1714-18) and contributed much to the modern system of equity.

Cowper's gland: see REPRODUCTIVE SYSTEM

cowpox, infectious disease of cows caused by a virus related to the virus of smallpox. Also called variola, it is characterized by pustular lesions on the teats and udder. Cowpox is transmitted by contact, inducing a mild infection of the hands in persons who milk infected cows. The fact that such persons

had immunity to smallpox led Edward JENNER to attempt VACCINATION with this virus, instead of using the dangerous method of vaccinating with material from the sores of smallpox. Jenner's method was successful and is the basis of the modern vaccination against smallpox. Horses and sheep may contract a similar disease.

cowrie or **cowry** (both kou'rê), common name applied to marine gastropods belonging to the family Cypraeidae, a well-developed family of marine snails found in the tropics. Cowries are abundant in the Indian Ocean, particularly in the East Indies and the Maldiv Islands. Species of cowries inhabit the waters around 5 California and the warm waters southward from the SE United States. They characteristically have massive, smooth, shiny shells with striking patterns and colors. The upper surface is round and the lower flat. When alive, the cowrie's shell is usually concealed by its large mantle, as the cowrie creeps along the ocean bottom, the mantle envelops the shell. As the body grows, the inner whorls of the shell are dissolved, and the dissolved lime is then used to enlarge the outer whorl of the shell. Some shells have been used for money, e.g., those of the money cowrie, *Cypraea moneta*. The shells of various species are used also for personal adornment and in some primitive cultures indicate the rank of the wearer. The smooth brown cowrie, *Cypraea spadicea*, inhabits the protected outer coast and mud flats in 5 California, often as far north as Newport, Calif. The most prized cowrie for a shell collector is the tiger cowrie, *Cypraea tigris*, which grows to 4 in. (10 cm) in length and whose shell is considered by some to be the most lustrous shell of the South Pacific. Having the appearance of a tiger skin, it is white with many brown spots. Cowries are classified in the phylum MOLLUSCA, class Gastropoda, order Mesogastropoda, family Cypraeidae.

cowslip, name for plants of the BORAGE, MARSH MARI-GOLD, and PRIMROSE families.

Cox, David, 1783-1859, English landscape painter, a follower of John Constable. He is best known for his watercolors of Welsh scenery, of which he produced a great number. Cox is well represented in the British and the Victoria and Albert museums and in the Birmingham Art Gallery. See biographies by N. N. Solly (1875) and William Hall (1881), study by F. G. Roe (1946).

Cox, Jacob Dolson, 1828-1900, Union general in the Civil War and American statesman, b. Montreal, of a New York City family. Admitted to the Ohio bar in 1853, he was active in organizing the new Republican party there and served (1859-61) in the state senate. Cox, made a brigadier general of volunteers early in the Civil War, served ably in the Kanawha valley and Antietam campaigns and commanded in West Virginia (1862-63) and Ohio (April-Dec., 1863). He later led a corps in the Atlanta campaign (1864), fought at Nashville (Dec., 1864), and finished his service with Sherman in North Carolina. He had risen to be a major general of volunteers and, returning home a hero, was elected governor of Ohio for the term 1866-68. Because he supported President Andrew Johnson on Reconstruction against the radical Republicans, he was not renominated. Nevertheless U. S. Grant, on assuming the presidency, made Cox his Secretary of the Interior. This was one of Grant's few good appointments. Cox, however, advocated and practiced civil service reform and opposed the President on other points, notably the move to annex Santo Domingo. The Republican spoilsman had long been hostile to him, and in Oct., 1870, Cox resigned from the cabinet and became identified with the Liberal Republicans. He later served one term in Congress (1877-79), was dean of the Cincinnati Law School for 16 years beginning in 1881, and also served as president of the Univ. of Cincinnati from 1885 to 1889. He wrote ably on military affairs. His books include *Atlanta* (1882), *The Battle of Franklin* (1897), *The March to the Sea* (1898), and *Military Reminiscences of the Civil War* (1900). Kenyon Cox was his son.

Cox, James Middleton, 1870-1957, American political leader and journalist, b. Butler co., Ohio. After serving on the editorial staff of the Cincinnati *Enquirer*, he bought the Dayton (Ohio) *Daily News* (1898) and subsequently acquired several other papers in different states. He served in the U. S. House of Representatives (1909-13). As governor of Ohio (1913-15, 1917-21) he became prominent as a supporter of President Wilson. Nominated in 1920 as presidential candidate by the Democratic party with Franklin Delano Roosevelt as his running mate, Cox, a staunch supporter of the League of Nations, was soundly defeated by Warren C. Harding. See his autobiography, *Journey through 44 Years* (1946).

Cox, Kenyon, 1856-1919, American painter, draftsman, and art critic, b. Warren, Ohio. He studied in Cincinnati, at the Pennsylvania Academy of the Fine Arts, and with Carolus-Duran and Gerôme in Paris. He worked in New York City, where he became an influential teacher at the Art Students League and the National Academy of Design. His portraits, figure pieces, and murals are academic in style. He painted murals for the Library of Congress, the state capitols of Iowa and Minnesota, and the public library of Winona, Minn. His portrait of Saint-Gaudens is in the Metropolitan Museum. Cox's writings on art include *Old Masters and New* (1905), *The Classic Point of View* (1911), and *Concerning Painting* (1917).

Cox, Samuel Sullivan, 1824-89, American statesman and legislator, b. Zanesville, Ohio. He traveled widely, practiced law, and was a newspaper editor before serving (1857-65) as a Congressman from Ohio. He moved (1865) to New York City and served again (1869-85) in the U. S. Congress. Cox argued for reforms in the civil service, worked to extend the scope of the census, and championed legislation for the development of the West. After serving (1885-86) as minister to Turkey, he again entered (1886) Congress. Among his books are *A Buckeye Abroad* (1852), *Puritanism in Politics* (1863), and *Three Decades of Federal Legislation* (1885). See biography by David Lindsey (1959).

Coxe, Tench, 1755-1824, American political economist, b. Philadelphia. He entered his father's mercantile business in 1776, but after 1790, when he became assistant to Alexander Hamilton, the Secretary of the Treasury, he remained in public office, although he never attained an important office. A firm believer in a balanced national economy, he supported Hamilton in his efforts to put the finances of the country on a sound basis. Politically, however, he was Anti-Federalist. He assisted Jefferson on two reports to Congress—one on fisheries, the other on foreign commerce. In *Coxe's Enquiry into the Principles on Which a Commercial System for the United States of America Should Be Founded* (1787), he first urged the necessity of an economy balanced between agriculture and manufacturing. He advocated especially the culture and manufacture of cotton. Many of his essays are collected in his *Views of the United States* (1794). His *Statement of the Arts and Manufactures of the United States of America* 1810 is an official digest of the census data collected in that year. See study by Harold Hutcheson (1938).

Coxetter, Louis Mitchell (kôk'səter), 1818-73, Confederate privateersman and blockade-runner, b. Nova Scotia. He settled in Charleston, S. C., and in the Civil War he captained the ship *Jefferson Davis*, which captured 10 prizes in 1861. When, because of the increasing effectiveness of the Union blockade, profiteering declined, Coxetter turned to blockade-running, at which he was equally successful.

Coxey, Jacob Sechler (kôk'sē), 1854-1951, American social reformer, b. Selinsgrove, Pa. He began his career as a stationary engineer, later turning to the scrap-iron business and then to sandstone quarrying in Massillon, Ohio. Interested in the problem of the unemployed, he advocated public works, financed by fiat money, as a remedy. He was Republican mayor (1931-33) of Massillon but was an unsuccessful candidate for many major public offices, including the presidency in 1932 and 1936. He was most famous, however, as the leader of *Coxey's Army*, a band of jobless men who marched to Washington, D. C., following the Panic of 1893, to petition Congress for measures that they hoped would relieve unemployment and distress. Coxey was aided by Carl Browne, a skilled agitator with curious religious notions. By wide advertising Coxey gathered more than 100 men and left Massillon with them on Easter Sunday, 1894, intending to reach Washington for a May Day demonstration. The "army," named the Commonwealth of Christ by Browne, was met by crowds in every city through which it passed. It had an anticlimactic and ineffectual ending when, reaching Washington with c. 500 men instead of the proclaimed 100,000, its leaders were arrested for walking on the Capitol lawn. Coxey's was only one of several industrial "armies" that in those months started from different sections of the country for the capital. See D. L. McMurry, *Coxey's Army* (1929, repr. 1970).

Coyoacan* see MEXICO, city

coyote (kî'ôt, kî'ô'tē) or **prairie wolf**, small, swift wolf, *Canis latrans*, native to W. North America. It is found in deserts, prairies, open woodlands, and brush country, it is also called brush wolf. The coy-

ote resembles a medium-sized dog, with a narrow, pointed face, long, thick, tawny fur and a black-tipped bushy tail. Adult males have a head and body length of about 35 in. (89 cm), with a 14-in. (36-cm) tail, they stand 21 in. (53 cm) at the shoulder and usually weigh about 30 lb (14 kg). The cry of the coyote, heard in the early evening, is a series of high-pitched yelps. Coyotes live in pairs, and both parents care for the young, they make their dens in roots of trees, rock crevices, or in ground burrows made by other animals. They are largely nocturnal, but are also seen in the day. They hunt alone, in pairs, or in small groups. Omnivorous feeders, they prey on a variety of small animals, sometimes cooperating to attack larger mammals, they also eat plant matter, carrion, and garbage. They can maintain a speed of 35 mi (56 km) per hour while chasing prey. Coyotes are responsible for destroying some domestic livestock, but they are valuable scavengers and destroyers of rodents. There has almost always been a bounty on coyotes somewhere in the United States, and many thousands are killed each year. Despite this, coyotes have not been reduced in number, and their range has actually increased in the past century. Common in the central and W. United States, they range N to Alaska, S to Central America, and E to the Great Lakes, they are occasionally seen even in New England. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Canidae.

Coyppel (kwəp'ēl), family of French painters. Noel Coyppel, 1628-1707, director of the Académie de France à Rome and later of the Académie royale de peinture et de sculpture in Paris, was employed on the decorations of the palaces of the Louvre, Tuileries, Fontainebleau, and Versailles. One of his best-known paintings is the *Martyrdom of St. James* (Notre-Dame de Paris). He was succeeded as director of the Académie royale by his son, **Antoine Coyppel**, 1661-1722, who was made court painter in 1716. His Aeneid series, painted for the Palais-Royal, are among the foremost expressions of high baroque decoration in France. His work combined the pedantry of classical taste with the melodrama of baroque trompe-l'œil (illusionistic) effects. He was also an accomplished etcher.

coyppu* see NUTRIA

Coysevox, Antoine (āntwan' kwəzvō'), 1640-1720, French sculptor. He enjoyed the patronage of Louis XIV and produced a great part of the sculpture at Versailles. His *Winged Horses*, at the entrance to the Tuileries gardens, and his portrait and memorial sculptures show free, vigorous, and original treatment. The bust of Conde (Le Havre), that of Colbert (Versailles), and the tomb of Mazarin (Louvre) are notable works.

Coz (kōz), Judahite. 1 Chron. 4:8.

Cozbi (kōz'bī), Midianite woman whom Phinehas killed Num. 25:6-18.

Cozens, Alexander (kūz'ənz), c. 1717-1786, English draftsman and writer, b. Russia. Cozens is thought to have been the first principal English master to work entirely with landscape subjects. He invented a system of "blot" drawings using accidental blots on drawing paper to aid his imagination by suggesting a landscape that could be further developed. In the 1950s his work was exhibited as that of a precursor of the ABSTRACT EXPRESSIONISTS. He expounded his blot system in his treatise, *A New Method of Assisting the Invention in Drawing Original Compositions of Landscape* (c. 1785). His son, John Robert Cozens, 1752-97, English watercolor landscape artist, is best known for his poetic paintings of the Alps and Italy. His work had an influence on both Turner and Girtin. Examples of his watercolors are in the Victoria and Albert Museum, the Tate Gallery, and the British Museum (all London). See A. P. Oppe, *Alexander and John Robert Cozens* (1953).

Cozzens, James Gould, 1903-, American novelist, b. Chicago. His novels usually concern upper-middle-class professional men who are faced with moral dilemmas that require partial compromise with their ideals. All Cozzens's works are characterized by meticulous craftsmanship and an objective, almost clinical style. Among his important novels are *The Last Adam* (1933), *The Just and the Unjust* (1942), *Guard of Honor* (1948, Pulitzer Prize), *By Love Possessed* (1957), and *Morning, Noon, and Night* (1968).

Cr, chemical symbol of the element CHROMIUM.

crab, CRUSTACEAN with an enlarged cephalothorax covered by a broad, flat shell called the carapace. Extending from the cephalothorax are the various appendages: five pairs of legs, the first pair bearing claws (or pincers), are attached at the sides, two

eyes on short, movable stalks, two short antennules, two longer antennae, and numerous mouthparts are attached at the front, at the rear the tiny abdomen is bent under the cephalothorax. Crabs are chiefly marine, but some are terrestrial for long periods. They are omnivorous, some are scavengers and others predators. The abdomen of the female, wider and flatter than that of the male, forms an apronlike structure that continuously circulates water over the eggs that are carried on her underside. The free-swimming larva, which hatches in about two weeks, is easily recognized by the large spine that projects from its carapace. After several molts, the young crab settles to the bottom and begins to take on adult features. Crabs tend to move sideways, although they are capable of locomotion in all directions. Swimming crabs have the last pair of legs flattened to form paddles, of these the BLUE CRAB of the Atlantic coast of the United States is much used for food. It is marketed as a soft-shelled crab after it has molted and before the new shell has hardened. Females of the oyster and mussel crabs live inside the shells of bivalve mollusks. Often seen scurrying about near their burrows in muddy banks are the FIDDLER CRABS, the males of which have one much enlarged claw used in defense and in courtship rituals. The sand, or ghost, crabs build burrows high up on the sand into which they seem to vanish. The sluggish, long-legged spider crabs are often disguised by the algae, barnacles, and sea anemones that attach themselves to the carapace. The giant spider crab of Japan, the largest living arthropod, has legs about 4 ft (22 cm) long and a carapace over 1 ft (30 cm) wide. The closely related kelp crabs are found in kelp beds in the Pacific. The name king crab is applied to the largest (up to 15 lb/6.8 kg) of the edible crabs, found in the N Pacific and marketed canned or frozen, and also to the HORSESHOE CRAB, which is not a crustacean. True crabs are classified in the phylum ARTHROPODA, class Crustacea, order Decapoda. See also HERMIT CRAB.

Crab, The, English name for CANCER, a CONSTELLATION.

crabapple: see APPLE.

Crabb, George, 1778–1851, English writer and philologist. He is known for his *Dictionary of English Synonyms* (1816) and his *History of English Law* (1829).

Crabbe, George, 1754–1832, English poet, b. Aldeburgh, Suffolk. After practicing medicine for a short time, he went to London in 1780, hoping to earn money by his writing. He was befriended by Edmund Burke, whose generous assistance aided in the publication of *The Library* (1781). He took orders in 1781 and held various livings, becoming rector at Trowbridge in 1814. *The Village* (1783), his most famous work, is a grim picture of rustic life, written partly in reply to Goldsmith's nostalgic *Deserted Village*. His bleak, realistic descriptions of life led Byron to call him "nature's sternest painter, yet the best." His other works include *The Parish Register* (1807), *The Borough* (1810), *Tales* (1812), and *Tales of the Hall* (1819). See biographies by his son (ed. by E. M. Forster, 1932, repr. 1949) and R. L. Chamberlain (1965), study by Arthur Pollard (1972).

crabgrass, name for any of several GRASS species of the genus *Digitaria*, and especially the species *D. sanguinalis*. Crabgrass is a common lawn weed, especially in the S and E United States. The grass has branching stems that may reach a length of 3 ft (91 cm) and flowers borne on purple spikes. It is sometimes cut for hay.

Crab Nebula, diffuse gaseous NEBULA in the constellation Taurus, cataloged as M1 or NGC 1952. It is the remnant of a SUPERNOVA observed in 1054 by the Chinese and Japanese. The nebula is a strong emitter of radio waves and X rays. At its center is an optical PULSAR.

Crabtree, Lotta, 1847–1924, American actress, b. New York City. A protégée of Lola MONTEZ, she became, while still a child, a favorite in California mining camps with her sprightly singing, dancing, and reciting. In 1867 she scored her first success in New York City in a dramatization of Dickens's *Old Curiosity Shop*, and thereafter she performed in burlesque and comic pieces, captivating large audiences. She retired in 1891. See biography by David Dempsey (1968).

cracking of petroleum: see PETROLEUM.

Craddock, Charles Egbert, pseud. of Mary Noailles Murfree, 1850–1922, American novelist, b. near Murfreesboro, Tenn. She wrote her best works about the mountain people of Tennessee, most notably *The Prophet of the Great Smoky Mountains* (1885). Her novels combined romantic

descriptions of landscape with realistic rendering of local dialect. She also wrote a series of Southern historical novels, including *Where the Battle Was Fought* (1884). See biography by E. W. Parks (1941), study by Richard Cary (1971).

Craddock, town (1970 pop. 22,329), Cape Province, SE South Africa, on the Great Fish River, founded as a frontier outpost in 1811. It is a trade and distribution center. Craddock's Dutch Reformed church was built (1868) as a replica of St. Martin's-in-the-Fields in London. Olive Schreiner, the South African author and feminist, lived in Craddock and is buried outside the town.

crafts: see ARTS AND CRAFTS.

Craig, Edward Gordon, 1872–1966, English scene designer, producer, and actor. The son of Ellen Terry, Gordon Craig began acting with Henry Irving's Lyceum company (1885–97). Feeling that the realism in vogue was too limiting, he turned to scene design and developed new theories. He strove for the poetic and suggestive in his designs in order to capture the essential spirit of the play. His ideas gave new freedom to scene design, although many were impractical in execution. Among his notable productions were *The Vikings* and *Much Ado about Nothing* (both in 1903 for Ellen Terry) and *Hamlet* (with the Moscow Art Theatre in 1912). At Florence, Italy, he founded (1913) the Gordon Craig School for the Art of the Theatre, he also edited a magazine, *The Mask* (1908–29). He wrote *On the Art of the Theatre* (1911, rev. ed. 1957), *The Theatre Advancing* (1921), *Scene* (1923), and biographies of Henry Irving (1930) and Ellen Terry (1931). See his memoirs (1957), biographies by his son Edward Craig (1968) and by Denis Babelt (1966).

Craig, James: see CRAIGAVON, JAMES CRAIG 1ST VISCOUNT.

Craig, Sir James Henry, 1748–1812, British soldier, governor of Canada (1807–11), b. Gibraltar. He served in the British army from 1763, fighting in the American Revolution and later holding posts in Africa and India. In 1807 he was appointed governor of Canada and lieutenant governor of Lower Canada (Quebec). His lack of sympathy with representative government and with the French Canadians found expression in his dissolution (1809) of the assembly of Lower Canada and in the imprisonment of the sponsors of the newly established journal *Le Canadien*. His arbitrary methods served only to consolidate the position of the French Canadians. Craig was replaced for reasons of health by Sir George Prevost.

Craig, John, 1512?–1600, Scottish minister of the Reformation. He joined the Dominican order, but through reading the *Institutes* of Calvin, he adopted Protestantism. Imprisoned at Rome for heresy, he escaped (1559) and went to Vienna, where he preached before Archduke Maximilian. Returning to Scotland in 1560, he shortly became the colleague of John Knox in Edinburgh. Chaplain to James VI after 1579, he was the author of the *King's Confession* (1581), upon which was based the National Covenant of 1638. See Craig's Short Summe of the Whole Catechisme (1581, ed. by T. G. Law, 1883).

Craigavon, James Craig, 1st Viscount (krägvä'vən), 1871–1940, Irish statesman. He worked with Edward CARSON in rousing the Protestants of Ulster against HOME RULE in the crisis preceding World War I. He organized the Ulster Volunteers to resist any attempt to enforce Home Rule. In 1921 he became prime minister of the newly established government of Northern Ireland, a position he held until his death. He was created a viscount in 1927. See biography by St. John Ervine (1949).

Craigavon, urban district (1971 pop. 12,594), Co. Armagh, S. central Northern Ireland. Craigavon was designated one of the NEW TOWNS in 1962, primarily to stimulate economic growth. Rubber products are made there.

Craigie, Sir William A., 1867–1957, British lexicographer, b. Dundee, Scotland. Educated at the Univ. of St. Andrews, Craigie studied Scandinavian languages at Copenhagen before beginning in 1893 his career as lecturer at St. Andrews and as lecturer and professor at Oxford. Generally considered the foremost lexicographer of his time, he was engaged on the *New English Dictionary* (commonly called the *Oxford Dictionary*) after 1897 and was joint editor from 1901 to 1933. Craigie was persuaded to come to the United States and was the chief editor of *A Dictionary of American English on Historical Principles* (issued in parts after 1936, published as 4 vol., 1938–43). He also edited other dictionaries, made critical editions of texts, and wrote monographs and textbooks on the English language.

Craik, Dinah Maria Mulock (kräk), 1826–87, English author. She is best known for the moralistic novel *John Halifax, Gentleman* (1856) and for the children's classics *The Adventures of a Brownie* (1872) and *The Little Lame Prince* (1875).

Craiova (kräyö'vā), city (1970 est. pop. 175,000), SW Rumania, in Walachia, on the Jiu River, a tributary of the Danube. It is the administrative and industrial center of the agricultural and mineral-rich Oltenia region and is an important market for grain. Machine building, food processing, and the manufacture of electrical equipment are the chief industries. Built on the site of a Roman settlement, Craiova became the capital of Oltenia in 1492. It was destroyed by an earthquake in 1790 and burnt by the Turks in 1802. An agreement signed in the city in 1940 returned S. Dobruja to Bulgaria. Craiova has a university (est. 1966) and other institutions of higher learning, a state philharmonic orchestra, and several museums containing prehistoric and Roman relics. The 17th-century St. Demetrius church (restored 18th cent.) and the 19th-century palace are also of interest.

crake: see RAIL.

Cram, Ralph Adams, 1863–1942, American architect, b. Hampton Falls, N.H. An ardent exponent of Gothic architecture, Cram produced many collegiate and ecclesiastical works in a neo-Gothic style. Among these are part of the reconstruction of the Cathedral of St. John the Divine in New York City, the graduate school and chapel at Princeton, and buildings at Williams, Phillips Exeter Academy, Rice Univ., and the U.S. Military Academy at West Point. After the withdrawal of B. G. GOODHUE in 1914, the architectural firm with which he was associated was known as Cram and Ferguson.

Cramer, Johann Baptist (yöhan' bäptist' kräm'är), 1771–1858, German pianist and piano teacher. He studied (1779–81) with Clementi in London. From 1788 he toured as a pianist, achieving international distinction. After teaching (1832–45) in Munich and Paris, he returned to London. He wrote many sonatas and several piano concertos, but he is remembered for 84 technical studies (1804).

cramp, painful uncontrollable contraction of a muscle or group of muscles. The type that results from cold, strain, or disturbance of circulation (as experienced by swimmers) is eased by massage and the application of heat. Cramp in the abdominal or skeletal muscles brought on by hard physical exertion in extremely high temperatures (e.g., in miners, stokers, or firemen) because of loss of salt from the body during profuse perspiration can last for hours or days if untreated. Such cramps are considered to be a type of HEAT EXHAUSTION. A cool atmosphere and the replacement of salt and water orally or intravenously is required, and application of heat is not recommended. Heat cramps in persons who do heavy labor can be prevented by the addition of salt to drinking water or by taking salt tablets. Contraction of muscles in a hollow organ is known as COLIC. A stitch in the side is due to a cramp in the muscles between the ribs.

Cranach or Kranach, Lucas (both löö'käs krä'näkh), the Elder, 1472–1553, German painter and engraver. He settled in Wittenberg c. 1504 and was court painter successively under three electors of Saxony. There he maintained a flourishing workshop and was twice burgomaster. Cranach was a friend of Luther, whose doctrine he upheld in numerous paintings and woodcuts, and he has been called the painter of the Reformation. He was a rapid and prolific painter, and the work turned out by his studio is uneven in excellence. Naïve and fanciful, often awkward in draftsmanship, it has, nonetheless, freshness and originality and a warm, rich color. His portraits are particularly successful. Among his best-known works are *Repose in Egypt* (Gemäldgalerie, Staatliche Mus., Berlin-Dahlem), *Judgment of Paris* (Staatliche Kunsthalle, Karlsruhe); *Adam and Eve* (Courtauld Inst., London), and *Crucifixion* (Weimar). This last contains figures of Luther and Cranach. His many famous portraits include those of Elector John Frederick and *Self-Portrait* (Uffizi). Cranach was also an accomplished miniaturist. He produced a few copperplates and designs for woodcuts. See study ed. by E. Ruhmer (1963). His son and pupil Lucas Cranach, the Younger, 1515–86, continued the tradition of his father whose workshop, signature, and popularity he inherited. Their work is often indistinguishable.

cranberry, name for low creeping evergreen BOG plants of the genus *Oxycoccus* of the family Ericaceae (HEATH family). Cranberries are considered by some botanists to be species of the blueberry genus

Vaccinium The tart red berries are used for sauces, jellies, pies, and beverages. The European or small cranberry is found in North America, but the cranberry of commercial cultivation is the native American or large cranberry (*O. v. macrocarpus*). This cranberry has been in cultivation since c 1840, chiefly in New Jersey, Massachusetts, and Wisconsin bogs that are especially prepared for annual flooding. The cranberry is prevalent on Cape Cod and is the chief export crop of Massachusetts. The serving of cranberry sauce with the Thanksgiving turkey is traditional in the United States. Other species of the genus are also called cranberry, but are of less importance. The unrelated high-bush cranberry or cranberry tree belongs to the family *Caprifoliaceae* (*Honeysuckle* family). Cranberries of the heath family are classified in the division *Magnoliophyta*, class *Magnoliopsida*, order *Ericales*, family *Ericaceae*. The family *Caprifoliaceae* is in the order *Dipsacales*.

Cranbrook, city (1971 pop. 12,000), SE British Columbia, Canada. It is a lumbering center.

Cranbrook Foundation, at Bloomfield Hills, Mich., est. and endowed by George G. and Ellen Booth in 1927. It includes a noted academy of art, an institute of science, Christ Church (Episcopal), Brookside School (elementary, coeducational), Cranbrook School (preparatory, for boys, 1927), Kingswood School (preparatory, for girls, 1931). Most of the buildings were designed by Eliel Saarinen, many statues by Carl Milles are also there.

Crandell, Prudence, 1803-89, American educator and abolitionist, b. Hopkinton, RI. In 1831 she opened a school for girls in Canterbury, Conn. Her decision to admit a Negro was protested, and in 1833 she decided to devote the school entirely to the education of Negro girls. She was arrested and tried, the judgment against her being reversed on appeal in 1834. In that year she gave up her work, married the Rev. Calvin Philleo, and moved to the Middle West.

Crane, Hart (Harold Hart Crane), 1899-1932, American poet, b. Garrettsville, Ohio. He published only two volumes of poetry during his lifetime, but those works established Crane as one of the most original and vital American poets of the 20th cent. His extraordinarily complex poetry, with its rich imagery, verbal ingenuity, and meticulous craftsmanship, curiously combines ecstatic optimism with a sense of haunted alienation. *White Buildings* (1926), his first collection of poems, was inspired by his experience of New York City. His most ambitious work is *The Bridge* (1930), a series of closely related long poems on the United States in which the Brooklyn Bridge serves as a mystical unifying symbol of civilization's evolution. Crane's personal life was anguished and turbulent. After an unhappy childhood during which he was torn between estranged parents, he held a variety of uninteresting jobs, always, however, returning to New York City and his writing. An alcoholic and a homosexual, he was constantly plagued by money problems and was often a severe trial to friends who tried to help him. In 1931 he won a Guggenheim Fellowship and went to Mexico to work on a long poem about Latin America, a year later, returning to the U.S., the poem not even started, he jumped overboard from his ship and was drowned. His collected poems were published in 1933. See his letters ed. by T. S. W. Lewis (1974), biographies by Philip Horton (new ed. 1957) and John Unterecker (1969), studies by H. A. Leibowitz (1968) and M. D. Uroff (1974).

Crane, Stephen, 1871-1900, American novelist, poet, and short-story writer, b. Newark, N.J. Often designated the first modern American writer, Crane is ranked among the authors who introduced realism into American literature. The 14th child of a Methodist minister, he grew up in Port Jervis, N.Y., and briefly attended Lafayette College and Syracuse Univ. He moved to New York City in 1890 and for five years lived in poverty as a free-lance writer. His first novel, *Maggie: A Girl of the Streets* (1893), a grimly realistic story of slum life, was unpopular but gained the young writer the friendship of Hamlin Garland and William Dean Howells. Crane's next novel, *The Red Badge of Courage* (1895), brought him wide and deserved fame. Set during the Civil War, the novel traces the development of a young recruit, Henry Fleming, through fear, illusion, panic, and cowardice, to a quiet, humble heroism. This remarkable account of the emotions of a soldier under fire is all the more amazing since Crane had never been in battle. On the strength of the novel he served as a foreign correspondent in Cuba and in Greece. Around 1897 he married Cora Taylor, who

ran a brothel in Florida, this marriage, coupled with Crane's unorthodox personality, aroused scandalous rumors including those that he was a drug addict and a satanist. Because of this unfair slander Crane spent his last years abroad, he died of tuberculosis in Germany at the age of 28. Crane was a superb literary stylist who emphasized irony and paradox and made innovative use of imagery and symbolism. Thus, although realistic, his works are highly individual. In addition to his novels he wrote superb short stories and poems. The title stories of *The Open Boat and Other Tales* (1896) and *The Monster and Other Stories* (1899) are considered among the finest stories in English. His two books of epigrammatic free verse, *The Black Rider* (1895) and *War Is Kind* (1899), anticipated several strains of 20th-century poetry. Crane's collected works were published in 12 volumes (1925-26). See his letters, ed. by R. W. Stallman and Lillian Gilkes (1960), biographies by John Berryman (1950) and R. W. Stallman (1968), studies by D. G. Hoffman (1957), Eric Solomon (1966), Milne Holton (1972), and R. M. Weatherford, ed. (1973), bibliography by R. W. Stallman (1972).

Crane, Walter, 1845-1915, English designer, illustrator, and painter. As a painter he is grouped with the later Pre-Raphaelites, but he is better known for his illustrations of the works of Spenser and of Hawthorne's *Wonder Book* and Grimm's *Fairy Tales*. Seeking with William Morris to ally art with everyday life, he designed textiles, glass windows, tapestries, and house decorations. Crane's interest in socialism is expressed in his cartoons for *Commonweal* and *Justice*. In 1888 he founded the Arts and Crafts Exhibition Society of London. See his memoirs, *An Artist's Reminiscences* (1907), study by P. G. Konody (1902).

crane, large wading bird found in marshes in the Northern Hemisphere and in Africa. Although sometimes confused with herons, cranes are more closely related to rails and limpkins. Cranes are known for their loud trumpeting call that can be heard for miles and for the rhythmic dances they perform during mating season, when both males and females can be seen jumping high into the air. They eat small animals, grain, and other vegetable matter. The North American whooping crane, a white bird almost 5 ft (152 cm) tall, is nearly extinct, partly because the population increases slowly, even in protected environments, the female crane lays only two eggs per year. The sandhill crane, about 4 ft (122 cm) tall with gray plumage, is becoming rare; it winters W of the Mississippi River. The little brown crane breeds mainly in N and W North America. The Florida crane is brownish gray with a reddish, warty head. Cranes are classified in the phylum *CHORDATA*, subphylum *Vertebrata*, class *Aves*, order *Gruiformes*, family *Gruidae*.

crane, hoisting machine for lifting heavy loads and transferring them from one place to another, ordinarily over distances of not more than 200 ft (60 m). For longer distances a truck or trailer is apt to prove more economical, the chief advantages of a crane are its long reach and the great heights to which it can lift loads. Cranes actuated by either manual or animal power have been in use from early times. Modern cranes are of varied types and sizes, they may be actuated by steam, electricity, diesel, or hydraulic power as well as by manual power, and they are indispensable in industries where heavy materials are handled constantly. The overhead traveling crane, a type of bridge crane, is used inside buildings or in outdoor storage yards. Two or more parallel girders span its working area. Another girder, called the bridge, stretches between them and rolls along them on wheels; this girder, in turn, supports a carriage from which a lifting attachment is lowered by pulleys. On a stacking crane the pulleys are replaced by a stiff, rotating column on which a pair of forks ride up and down. The gantry crane, another type of bridge crane, has a bridge supported by vertical structures that move along tracks. Ganties are used on piers or in shipyards. The jib crane has a horizontal load-supporting boom fastened to a rotating vertical column, either attached to a wall or extending from floor to ceiling, when the column is held only at the bottom it is called a pillar crane. The derrick is a crane equipped either with a vertical mast held by struts, as on barges, or with guy wires, as in building construction. The boom is attached to the bottom of the mast by a pivot and is raised and lowered by a cable reaching from the top of the mast to the end of the boom. A crawler crane is a self-propelled crane that moves on caterpillar treads.

crane fly, true FLY resembling a mosquito, often called daddy longlegs because of its six long, delicate legs (The *HARVESTMAN*, also called daddy long-legs, belongs to an unrelated order.) Most species of crane flies have a single pair of wings and slender bodies. They feed upon plant substances and frequent damp places in pastures and meadows. Crane flies belong to the phylum *ARTHROPODA*, class *Insecta*, order *Diptera*, family *Tipulidae*.

cranial index: see *CEPHALIC INDEX*

cranium: see *SKULL*

crank, mechanical linkage consisting of a bar attached to a pivot at one of its ends in such a way that it is capable of rotating through a complete circle about the pivot. One of the principal uses of a crank is to turn reciprocating, or back and forth, motion into rotary motion or vice versa. A bell crank is one designed to change the direction of a linear motion.

Cranmer, Thomas (krän'mər), 1489-1556, English churchman under HENRY VIII, archbishop of Canterbury. A lecturer in divinity at Jesus College, Cambridge, he is said to have come to the attention of the king in 1529 by suggesting that Henry might further his efforts to achieve a divorce from KATHARINE OF ARAGON by collecting opinions in his favor from the universities. Cranmer went (1530) to Rome to argue the king's case and was (1532) an ambassador to Holy Roman Emperor Charles V. In 1533, Henry named him archbishop of Canterbury, and as soon as the appointment was confirmed by the pope, Cranmer proclaimed that Henry's marriage to Katharine was invalid. A few days later he crowned Anne BOLEYN as Henry's queen. Completely subservient to the king's will, Cranmer declared Anne's marriage invalid in 1536. He promoted Henry's marriage (1540) to Anne of Cleves and the divorce from her, and was later (1542) one of the accusers of Catherine Howard. Cranmer was strongly influenced by the German Reformation. With his friend Thomas CROMWELL, he endorsed the translation of the Bible into English and was influential in procuring a royal proclamation (1538) providing for a copy in every parish church. However, as long as Henry VIII lived, the archbishop could promote no significant doctrinal changes. The situation changed with the accession (1547) of the young EDWARD VI, and Cranmer shaped the doctrinal and liturgical transformation of the Church of England during Edward's reign. He was responsible for much of the first *BOOK OF COMMON PRAYER* (1549) and compiled the revised prayer book of 1552, which contains the most famous examples of Cranmer's sonorous prose, with the aid of prominent reformers from the Continent. His Forty-two Articles (1553), though never formally adopted, formed the basis of the Thirty-nine Articles (see *CRED 5*). Cranmer supported the claims of Lady Jane GREY after Edward's death. Upon the accession (1553) of the Roman Catholic Queen Mary I, he was tried for treason, then convicted of heresy, stripped of his preferments, and condemned. A few days before his death he recanted, but when asked to repeat the recantation in public at the stake, he refused and thrust the hand that had written it into the fire. See biographies and studies by F. C. Hutchinson (1951, repr. 1966), Theodore Maynard (1956), and J. G. Ridley (1962, repr. 1966).

Cranston, industrial city (1970 pop. 73,037), Providence co., central R.I., a residential suburb of Providence, inc. as a town 1754, as a city 1910. Its manufactures include machinery, chemicals, textiles, and beer. The city was named for Samuel Cranston, a colonial governor of Rhode Island. In the 19th cent. Cranston was an important textile center. The Friends Meeting House (1729) and several pre-Revolutionary buildings remain standing.

Crapsey, Adelaide (krăp'sē), 1878-1914, American poet, b. Brooklyn, N.Y., grad. Vassar, 1901, daughter of Algernon Sidney Crapsey. After teaching in girls' schools she became an instructor at Smith College. A slender volume, *Verse*, which won high praise from critics, appeared a year after her early death from tuberculosis, a new edition with 20 additional poems was issued in 1934. Her special contribution to verse form is the cinquain—a compressed five-line verse resembling the Japanese haiku in its fragile precision and expressive delicacy. See biography by M. E. Osborn (1933).

Crapsey, Algernon Sidney, 1847-1927, American Episcopal clergyman, b. Fairmont, Ohio. In 1879 he became rector of St. Andrew's Church, Rochester, N.Y., which under his administration was known for its social work. In 1906 he was expelled from the ministry for heresy because of beliefs concerning the physical being and life of Christ. His books include *Religion and Politics* (1905), *The Rise of the Working Class* (1914), *The Ways of the Gods* (1920), and the autobiographical *Last of the Heretics* (1924).

craquelure (kräklōō'), hairline surface cracking of paintings into characteristic patterns determined by age, climatic conditions, and the materials used in the work. Cracking was so common in works by 18th-century English painters that it became known as *craquelure anglaise*. Forgers and restorers often imitate craquelure to enhance the look of authenticity in their works.

Crashaw, Richard (krāsh'ō), 1612?-1649, one of the English METAPHYSICAL POETS. He was graduated from Cambridge in 1634 and remained there as a fellow at Peterhouse until the Puritan uprising, when he fled to the Continent (1643). Though he was the son of an ardent Puritan clergyman, by 1646 he had converted to Roman Catholicism. He served for several years as an attendant to Cardinal Palotto, who finally procured him a minor post at the shrine of Loreto, Italy, in April, 1649. Four months later Crashaw died of a fever. Although he wrote secular poetry in Latin and Greek as well as English, his fame rests on his intense religious poetry. His strange mixture of sensuality and mysticism is unusual in English literature and has been compared to the baroque art of Italy and Spain. The principal volume of his work is *Steps to the Temple* (1646), enlarged to include *Delights of the Muses* (1648). See his complete poems ed. by G. W. Williams (1972), studies by Austin Warren (1957), G. W. Williams (1963), and M. F. Bertolasco (1971).

Crassus (krās'ēs), ancient Roman family, of the plebeian Lucian gens. It produced men who achieved great note in the 2d cent. and 1st cent. B.C. One of the well-known members was **Lucius Licinius Crassus**, d. 91 B.C., a noted orator and lawyer (much admired by Cicero). He was a strict follower of constitutional forms, and he and Scaevola as consuls in 95 B.C. proposed a law—called the Lucian Law, the Lex Lucina, or the Lex Licinia Mucia—to banish from Rome Latins who had gained Roman citizenship by illegal means (or what the law set as illegal means). This greatly aggravated anti-Roman sentiment among the allies and helped bring on the Social War. **Publius Licinius Crassus**, d. 87 B.C., was consul in 97. He was the financial backer of the Roman colony of Narbo (modern Narbonne) in Gaul and achieved fame by his victories in Spain after his consulship. He was a partisan of SULLA and, after being proscribed by the followers of Marius, committed suicide. His son, **Marcus Licinius Crassus**, d. 53 B.C., was the best-known member of the family. He was a man of considerable charm and almost unbounded avarice and ambition. He was a partisan of Sulla and commanded some of Sulla's forces. He was also a highly successful dealer in real estate, and bought property that was confiscated or deserted in the period of the bloody Sullan proscriptions. He became the principal landowner in Rome by organizing his private fire brigade, buying burning houses cheap, and then putting out the fire. He gained immense prestige—along with POMPEY—for suppressing the uprising of SPARTACUS. They were both consuls together in 70 B.C., and Crassus' rivalry and jealousy of Pompey grew. He was involved in plotting against Catiline, apparently secretly encouraging the conspiracy but not directly participating in it. He and Julius CAESAR drew closer together, Crassus hoping to use Caesar's ability, Caesar (deep in debt) hoping to use Crassus' money. Caesar, seeing that he needed stronger support than Crassus, created (60 B.C.) the First Triumvirate—Crassus, Pompey, and Caesar. With Crassus' envy of Pompey and Pompey's scorn of Crassus, the arrangement worked only because of Caesar's consummate ability in handling men. Crassus seems to have backed the political maneuvers of the notorious Clodius, and trouble was stirred up between Crassus and Pompey. Caesar called both of them to Lucca, where in 56 B.C. a conference reaffirmed the alliance. Crassus and Pompey were again consuls together in 55. Crassus managed to get Syria assigned for his proconsular service in 54. Avid for military glory, he left even before his term as consul was up to undertake a campaign against the Parthians. His ambition outran his ability. After early successes, his army was completely routed at Carrhae (modern Haran) by Parthian archers in 53 B.C. Crassus in this disgrace

was treacherously murdered, and Caius Cassius Longinus had difficulty in saving even the remnants of the army.

crater, circular, bowl-shaped depression on the earth's surface. (For a discussion of lunar craters, see MOON.) Many of the largest craters are formed by the impact of meteorites. Impacting at speeds in excess of 10 mi/sec (16 km/sec), a meteorite creates pressures on the order of millions of atmospheres, creating shock waves that blast out a circular hole and often destroy the meteorite. Berringer Crater, Arizona, c. 3/4 mi (1 1/2 km) in diameter and 600 ft (180 m) deep, is probably the best-known crater of this type. Others include Chubb Crater, Quebec, Lake Bosumtwi, Ghana, and Brent Crater, Ontario. Two major impact events have occurred in the 20th cent., both in Siberia. In 1908 near Lake Baykal one occurred that caused vast destruction of timber from its blast, and the other in 1947 at Sikhote-Alin also caused great damage. Craters are also commonly formed at the surface opening, or vent, of erupting volcanoes, particularly of the type called cinder cones, where the lava is extruded rather explosively. Virtually all volcanoes display a crater, called a sink, around the vent that is believed to be a collapse feature caused by molten lava subsiding as an eruption phase diminishes. Volcanic craters formed in these ways are relatively small, usually less than 1 mi (1.6 km) in diameter, and represent only a small fraction of the cone's diameter at the base. A caldera is a much larger crater, ranging from 3 to 18 mi (5-30 km) in diameter, and represents a considerable fraction of the volcano's basal diameter. Most calderas are formed by the collapse of the central part of a cone during great eruptions. A few small calderas have been formed by explosive eruptions in which the top of a volcano was blown out. Some volcanic craters are created by a combination of these events. Formed thousands of years ago, the caldera that contains Crater Lake, Oregon, is 6 mi (9.7 km) in diameter. In recent times, caldera-producing eruptions occurred at Krakatoa, Indonesia, in 1883 and Katmai, Alaska, in 1912. See ASTROBLEME, TEKITE, VOLCANO.

Crater Lake National Park, 160,290 acres (64,869 hectares), SW Oregon, in the Cascade Range, est. 1902. Crater Lake, 20 sq mi (52 sq km), lies in a huge pit that was created when the top of a prehistoric volcano was blown off by a violent eruption. The second-deepest lake (1,932 ft/589 m) in North America, Crater Lake is 6 mi (9.6 km) wide, lies 6,164 ft (1,879 m) above sea level, and is surrounded by cliffs that are from 500 to 2,000 ft (152-610 m) high. Having no inlet or outlet, the lake was formed by rain and snowfall, and its waters are maintained by precipitation. The lake was discovered in 1853 by prospectors, who called it Deep Blue Lake because of the intense blue of the water, it was renamed Crater Lake in 1869. A scenic highway follows the rim of the crater. Wizard Island, a cinder cone 776 ft (237 m) high, near the lake's western shore, was also formed by volcanic activity.

Craters of the Moon National Monument, 53,545 acres (21,665 hectares), S central Idaho, est. 1924. This region, composed of several closely grouped volcanoes, is suggestive of a telescopic view of the moon. Volcanic activity dating back c. 20,000 years has left behind cinder cones, tree molds, craters, and other interesting formations. At one time Indians used the lava caves.

Crates (krā'tēz), fl. 449 B.C., Athenian comic poet. He is said to have introduced into comedy themes other than those of personal satire, and he was one of the first to show the comic possibilities of the drunkard. Fragments of his plays survive.

Cratinus (krātī'nās), d. c. 419 B.C., Athenian comic poet. He won the prize at the Athenian drama contest when Aristophanes competed with *The Clouds* and was regarded with Aristophanes and Eupolis as one of the greatest comic poets. He attacked Pericles violently in his plays. Fragments of his plays survive.

craton (krā'tōn) see CONTINENT

Craven, Avery Odelle, 1886-, American historian, b. Randolph co., N.C. He received his Ph.D. at the Univ. of Chicago in 1923 and taught at several colleges in the Midwest before he returned in 1928 to Chicago, becoming professor of American history in 1929. Craven is a leader of that school of American historians that holds that the Civil War could have been avoided. His chief works are *Soil Exhaustion as a Factor in the Agricultural History of Virginia and Maryland, 1606-1860* (1926), *Edmund Ruffin, Southerner: a Study in Secession* (1932), *The Repressible Conflict, 1830-1861* (1939), *The Coming of the Civil*

War (1942, 2d ed. 1957), *The Rise of Southern Nationalism* (1953), *The Civil War in the Making 1815-1860* (1959), and *An Historian and the Civil War* (1964).

crawfish, see CRAYFISH

Crawford, Francis Marion, 1854-1909, American novelist, b. Bagni di Lucca, Italy, son of Thomas Crawford. He was educated in the United States and Europe and lived most of his adult life in Italy. The best of his romantic novels of Italy and other countries abroad include *Saracinesca* (1887), *Santi Ilario* (1889), and *Don Orsino* (1892). He also wrote romances set in the United States.

Crawford, Isabella Valancy, 1850-87, Canadian poet, b. Dublin, Ireland. The remote woodland region of her childhood in Upper Canada is depicted in her long, sentimental poem, "Malcolm's Katie." She died in poverty at age 37, and 20 years after her death her *Collected Poems* (1905) brought recognition of her talent.

Crawford, Joan, 1908-, American movie star, b. San Antonio, Texas, as Lucille Le Sueur. Crawford began her career as a Broadway chorus dancer, and in 1926 she began making films. In 1945 she won an Academy Award for her performance in *Mildred Pierce*. Crawford was a top box office attraction for many years. Her best-known films include *Grand Hotel* (1932), *The Women* (1939), and *Humoresque* (1954). Her later films, mostly in the horror genre, include *Berserk* (1967). See her autobiographies (1962 and 1972), study by L. J. Quirk (1970).

Crawford, Ralston, 1906-, American painter, b. St. Catherine's, Ont. Crawford's paintings are marked by precise detail, flat color, and the simplification of form. His works portray the American city and industrial machinery. *Steel Foundry* (1936) and *Grain Elevators from the Bridge* (1942) are in the Whitney Museum, New York City.

Crawford, Ruth, 1901-53, American composer, b. East Liverpool, Ohio. Crawford attended music schools in Jacksonville, Fla., and Chicago. Her most frequently performed composition is a string quartet (1931). She also collected and published American folk music with her husband, the musicologist and composer Charles Seeger, father of the folk singer Pete Seeger.

Crawford, Thomas, 1813-57, American sculptor, b. New York City. He was apprenticed to a wood carver and later worked for a firm of tombstone cutters. He achieved his first success with decorations for the Capitol at Washington, which include the figure above the dome entitled *Armed Freedom*, and the bronze doors and pediment statues for the Senate wing. He designed the Washington monument, Richmond, Va., for which he executed the equestrian figure and the figures of Patrick Henry and Jefferson. A pupil of Thorvaldsen, Crawford was a leading exponent of the Greek Revival movement. He lived and worked in Rome most of his life. He married Louise Cutter Ward, sister of Julia Ward Howe. The novelist Francis Marion Crawford was their youngest son.

Crawford, William Harris, 1772-1834, American statesman, b. Amherst co., Va. (his birthplace is now in Nelson co.). He moved with his parents to South Carolina and later to Georgia. After studying law he practiced at Lexington, Va., and served (1803-7) in the state legislature. In the stormy state political battles of the time, he was the leader of the upcountry forces and allied with the followers of James Jackson and later George M. Troup, leaders of the tide-water region. In a duel Crawford killed a partisan of John Clark, head of the opposite faction, and in another duel was wounded by Clark. In the U.S. Senate (1807-13), Crawford staunchly advocated rechartering the Bank of the United States. From 1813 to 1815 he was minister to France. He was then appointed Secretary of War by President Madison, but in 1816 he was made Secretary of the Treasury, a post he held through both of Monroe's administrations. He had strong support for the presidency in 1816 but disavowed his candidacy. In the presidential election of 1824, Crawford, a leading candidate, finished third in the voting. Since no candidate received a majority of the electoral votes, the election went to the House of Representatives, and John Quincy Adams was finally chosen. Crawford later served as a judge in Georgia. See biographies by P. J. Green (1965) and C. C. Mooney (1974).

Crawford Notch, water gap in the White Mts., N. central N.H., through which the Saco River flows. It is named for Abel Crawford, an early settler. The area is a state park (est. 1911).

Crawfordsvile, city (1970 pop. 13,842), seat of Montgomery co., W. central Ind., inc. 1866. It is the

trading center of an agricultural and dairy region. Major industries include printing and binding and the manufacture of nails and wire, plastic, and metal products. Wabash College and the Lew Wallace Study are in Crawfordsville.

Crawley, new town and urban district (1971 pop. 67,240), Sussex, SE England. Crawley was designated one of the NEW TOWNS in 1946 to alleviate overpopulation in London. There are many industries, including precision engineering. It is a regional retail shopping center. Crawley College of Further Education is there. In 1974, Crawley became part of the new nonmetropolitan county of West Sussex.

Crazer, Gaspar de (gas'par da kri'ar), c1584-1669, Flemish religious and portrait painter. He was greatly influenced by Rubens. While lacking the genius of Rubens, Crazer almost rivaled him in productivity and maintained a high standard of work. His paintings are to be seen in countless Flemish provincial churches and in the museums and churches of Brussels and Ghent.

crayfish or **crawfish**, freshwater CRUSTACEAN smaller than but structurally very similar to its marine relative the LOBSTER, and found in ponds and streams in most parts of the world except Africa. Crayfish grow some 3 to 4 in (7.6-10.2 cm) in length and are usually brownish green, some cave-dwelling forms are colorless and eyeless. They are scavengers, feeding on decayed organic matter and also on small fish. The swamp crayfish digs a burrow up to 3 ft (91 cm) deep with a water-filled cavity at the bottom in case of drought. The eggs develop while attached to the swimming legs of the female and look like miniature adults when hatched. Although crayfish are not eaten in most parts of the United States, they are consumed in areas in the Mississippi River basin and are used in the Louisiana area in a thick soup called crayfish bisque. They are agricultural pests in the Mississippi Delta area, where they feed on sprouting wheat and corn. A red-clawed species is considered a delicacy in Europe. Crayfish are classified in the phylum ARTHROPODA, class Crustacea, order Decapoda.

crayon, any drawing material available in stick form. The term includes charcoal, conte crayon, chalk, pastel, grease crayon, litho crayon, and children's wax colors. The pigment is often bound with gum tragacanth or wax, and the sticks are wrapped in paper or embedded in wood.

Crazy Horse, d. 1877, Indian chief of the Oglala SIOUX INDIANS. He was a prominent leader in the Sioux resistance to the encroachment of whites in the mineral-rich Black Hills. When Crazy Horse and his people refused to go on a reservation, troops attacked (March 17, 1876) their camp on Powder River. The great war chief was victorious in that battle as well as in his encounter with Gen. George CROOK on the Rosebud River (June 17). Crazy Horse joined SITTING BULL and GALL in defeating George Armstrong CUSTER at the battle of the Little Bighorn (June 25). In Jan., 1877, Gen. Nelson Appleton Miles attacked his camp, and Crazy Horse and his followers spent the remainder of the winter in a state of near starvation. The group, numbering about 1,000, finally surrendered at the Red Cloud agency in May. Imprisoned because of a rumor that he was planning a revolt, Crazy Horse was stabbed to death with a bayonet when attempting to escape. His bravery and skill were generally acknowledged, and he is revered by the Sioux as their greatest leader. See biographies by Mari Sandoz (1942, repr. 1955) and E. A. Brinninstool (1949).

crazyweed. see LOCOWEED

cream cup. see POPPY

creamery: see DAIRYING

cream of tartar, white crystalline powder. Chemically it is potassium hydrogen tartrate, $KHC_4H_4O_6$, the acidic potassium salt of TARTARIC ACID. It is used as the leavening agent in baking powders. An impure form, called tartar or argol, forms naturally during the fermentation of grape juice into wine and crystallizes in the wine casks.

Crébillon, Prosper Jolyot de (prôspër' zhôlyô' da kräbëyôn'), 1674-1762, French dramatist. His tragic melodramas, marked by violent plots, include *Idoménée* (1705), *Électre* (1708), and *Rhadamiste et Zénobie* (1711), which is considered his best. After a long retirement he was persuaded by Mme de Pompadour, who was seeking a rival to Voltaire, to write *Catiline* (1748), which was performed with great success. His son Claude Prosper Jolyot de Crébillon, 1707-77, wrote witty, ribald tales, notably *Les Égaréments du cœur et de l'esprit* (1736) and *Le Sopha* (1742).

crèche (krësh, krăsh), representation of the Infant Jesus in the manger, usually surrounded by figures of Mary, Joseph, shepherds, animals, and the Wise Men, also called Christmas Crib. The crèche has been displayed in churches during the period from Christmas Eve to Jan. 6 since the Middle Ages, especially after St. Francis of Assisi instituted the custom in 1223 at Greccio, Italy. It is a Christmas tradition in many homes. The term *crèche* is also applied to a DAY NURSERY.

Crecy (kräsë'), officially Crecy-en-Ponthieu (-a-N-pôNtyô'), village, Somme dept., N France. A nearby forest is popular for camping. At Crecy, on Aug. 26, 1346, Edward III of England defeated Philip VI of France in the HUNDRED YEARS WAR. The French forces were armed with crossbows and, although outnumbering the English troops, were overwhelmed by the English longbows. The victory enabled the English to reach Calais. Among the combatants were Edward the Black Prince of England and the blind John of Luxembourg, king of Bohemia, who, fighting for the French, died in the battle. Crecy is also known in English as Cressy.

Credi, Lorenzo di: see LORENZO DI CREDI

credit, granting of goods, services, or money in return for a promise of future payment. Most credit is accompanied by an INTEREST charge, which usually makes the future payment greater than an immediate payment would have been. The credit system is founded upon the lender's confidence in the borrower or in his COLLATERAL and general possessions. Credit may be classified according to the industry using it, its quality or liquidity, or the length of time for which it is extended. Basically there are two kinds, business and consumer. The chief function of business credit is the transference of capital from those who own it to those who can use it, in the expectation that the profit from its use will exceed the interest payable on the loan. Thus business credit increases the productive power of capital. Consumer credit permits the purchase of retail commodities without the use of cash or with the use of relatively little cash. It is estimated that some 90% of all wholesalers' and manufacturers' sales, and more than 30% of all retail sales are made on a credit basis. In the larger banks, credit-analysis departments determine the amount of credit that may safely be given to loan applicants. Data as to credit risk are supplied by agencies organized for that purpose. The chief agency in the United States is Dun and Bradstreet, formed by a merger (1933) of R. G. Dun & Company (1841) and the Bradstreet Company (1849). If more credit is granted than the community can liquidate, there is inflation, if too little is granted, there is deflation. A lack of business confidence may cause credit to dissolve, thereby contributing to economic crises, panics, and depressions. In BOOKKEEPING, the credit side is the side of the account on which payments are entered, hence, the term *credit* is sometimes applied to the payments themselves. See CREDIT CARD, DEBT, DEBT, PUBLIC, INSTALLMENT BUYING AND SELLING. See F. T. Juster, *Household Capital Formation and Financing, 1897-1962* (1966), W. E. Dunkman, *Money, Credit, and Banking* (1970).

credit, letter of, commercial instrument through which a bank or other financial institution instructs a correspondent institution to advance a specified sum of money to the bearer. The document is called a circular letter of credit when it is not addressed to any particular correspondent. In effect, a letter of credit is a DRAFT, save that the amount is merely stated as a maximum not to be exceeded. Letters of credit, mainly used by travelers, greatly simplify nonlocal business transactions. Those who issue such letters are usually so well known that any bank will honor the letter upon proper identification. Travelers' checks are a modified form of a letter of credit. They are issued in coupons, upon whose face a value is usually expressed in terms of the currency of a particular country. In the United States they are issued by express companies and banks. Circular letters of credit require that each payment, as it is made, be endorsed by the firm making payment so that other banks may know how much of the total credit has been used.

credit card, device used to obtain consumer credit at the time of purchasing an article or service. Credit cards may be issued by a local retailer, such as a department store, or a national retailer, such as one of the major oil companies. They may also be issued by third parties, such as a bank or group of banks, or an express or so-called travel and entertainment company. First popular in California, credit cards spread throughout the United States and much of

Western Europe during the late 1960s, between 1965 and 1970 the number of such cards grew from less than 5 million to more than 50 million. Through the revolving charge plan, card holders are able to postpone payment on their purchases by accepting a monthly interest charge. Consumers may also use the major bank cards to obtain short-term personal loans. Credit card issuers get revenue from fees paid by stores that accept their cards and from interest charged on unpaid credit balances. Concern has been voiced over widespread, sometimes unsolicited, distribution of bank credit cards, costly losses and theft of cards, and possible excessive encouragement of consumer debt at high interest rates.

Credit Mobilier of America (krë'dit möbilyä', krädë'), ephemeral construction company, connected with the building of the Union Pacific RR and involved in one of the major financial scandals in American history. Oakes Ames, Thomas C. DU RANT, and a few other influential stockholders of the Union Pacific organized the Credit Mobilier under an existing Pennsylvania charter, which they took over. Acting for both the Union Pacific and for their newly created construction company, they made contracts with themselves. Oakes Ames, as head of the Credit Mobilier, in 1867 assigned contracts to seven trustees to build the remaining 667 mi (1,074 km) of road for a total sum that brought profits variously estimated at from \$7 million to \$23 million. This process depleted generous congressional grants to the Union Pacific and left it under a heavy debt by the time of its completion in 1869. The scandal became political when Ames (a U.S. Representative), to forestall investigation or interference by Congress, sold or assigned shares of the Credit Mobilier stock to members of Congress at par, although the shares were worth twice as much at the time. He wrote to Henry S. McComb, an associate, that he had placed the stock "where it will produce the most good to us" and subsequently forwarded a list of Congressmen who had received or were to receive shares. Later friction between Ames and McComb facilitated the publication of these letters in Charles A. Dana's New York Sun in the midst of the presidential election campaign of 1872. A subsequent investigation by Congress badly smirched the political reputations of Vice President Schuyler Colfax, Senator James W. Patterson of New Hampshire, Representative James Brooks of New York, and others—most of all, of course, Ames himself. Ames and Brooks were censured by Congress, but there were no prosecutions. See study by J. B. Crawford (1880, repr. 1969).

credit union, cooperative financial institution that makes low-interest personal loans to its members. It is usually composed of persons from the same occupational group or the same local community. Funds for lending come from the sale of shares to members and from the members' savings deposits. Cooperative banking originated in Germany in the middle of the 19th cent.; it was developed by Hermann Schulze-Delitzsch and later was particularly adapted to rural communities by F. W. Raiffeisen. In the United States, the Credit Union National Association (founded 1934) has been instrumental in organizing credit unions. Credit unions are important because they provide loans to blue-collar workers and small farmers, who would otherwise have difficulty securing credit at reasonable interest rates. Under provisions of the Credit Union Act of 1934, U.S. credit unions are chartered by their respective states or by the Federal government. See R. F. Bergengren, *Credit Union, North America* (1940), Jack Dublin, *Credit Unions: Theory and Practice* (2d ed. 1971), J. C. Moody and G. C. Fite, *The Credit Union Movement* (1971).

creed [Lat. *credo*=I believe], summary of basic doctrines of faith. The following are historically important Christian creeds. 1 The Nicene Creed, beginning, "I believe in one God the Father Almighty, maker of heaven and earth, and of all things visible and invisible, and in one Lord Jesus Christ." It is usually described as a revision by the First Council of Constantinople (381) of the creed adopted at Nicaea in 325, although there are good grounds for the belief that it represents substantially a creed written or used by Eusebius of Caesarea. In the Western Church since the 9th cent. it has differed from the original by the addition of the *Filioque* clause "And in the Holy Ghost. Who proceedeth from the Father and the Son." ("qui ex Patre *Filioque* procedit.") Over this addition there has been a long controversy between the Orthodox Eastern and Roman Catholic churches. The Nicene Creed is an official creed of Orthodox Eastern, Roman Catholic, and some Protestant churches. 2 The ATHANASIAN

CREED, which is a partial statement of doctrine dealing especially with the Trinity and the Incarnation 3 The Apostles' Creed, beginning, "I believe in God the Father Almighty, Creator of heaven and earth And in Jesus Christ" It does not appear in its present form before 650, but its predecessors probably arose in Rome in the 2d or 3d cent It has two material differences from the Nicene Creed the phrase, "He descended into hell," is omitted in the Nicene, and the words "resurrection of the body" are changed to "resurrection of the dead" in the Nicene It is used by Roman Catholics at various daily services and at baptism, it is also much used by Protestants 4 The Augsburg Confession (1530), the official statement of the Lutheran churches It was mainly the work of Philip Melancthon and was endorsed by Martin Luther for the Diet of Augsburg 5 The Thirty-nine Articles, which are official in the Church of England They date in their present form from Elizabeth I's reign, when they were written by a group of bishops They are Calvinistic in theological emphasis and enounce clearly the royal supremacy in the Church of England They are included, with occasional modifications, in the prayer books of other churches of the Anglican Communion, including that of the Protestant Episcopal Church of the United States 6 The Westminster Confession (1645-47), the most celebrated pronouncement of English-speaking Calvinism It is official in the Church of Scotland, with occasional changes in most of its daughter churches (usually Presbyterian), and among Congregationalists See P T Fuhrmann, *Introduction to the Great Creeds of the Church* (1960), J H Leith, *Creeds of the Churches* (1963, repr 1973)

Cree Indians, North American Indians whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see AMERICAN INDIAN LANGUAGES) They formerly inhabited Manitoba S of the Churchill River Members of one branch of the Cree, allying themselves with the Siouan Assiniboin Indians, moved southwestward into buffalo territory and became the Plains Cree It is probable that they introduced the method of hunting buffalo by driving them into enclosures, since the Woodland Cree used this method in hunting deer The culture and language of the Woodland Cree greatly resembles that of the Ojibwa Indians A warlike tribe, the Cree were nevertheless friendly toward French and English fur traders, and their history is closely connected with the activities of the Hudson's Bay and the North West companies They were powerful in the late 18th cent until smallpox drastically reduced their population See Leonard Mason, *The Swampy Cree* (1967)

Creek Indians, North American Indian confederacy The peoples forming it were mostly of the Muskogean branch of the Hoka-Siouan linguistic stock (see AMERICAN INDIAN LANGUAGES) The Creek received their name from early white traders because so many of their villages were located at rivers and creeks They lived primarily in Alabama and Georgia and were settled, agricultural people There were more than 50 towns, generally called tribes, in the confederacy, which was formed chiefly for protection against the tribes to the north Certain villages were set aside for war ceremonies, others for peace celebrations Each had its annual green corn dance This festival was a time for renewing social ties and was a period of amnesty for criminals, except murderers The Creek Confederacy was not ruled by a permanent central government The structure was a combination of democratic and communistic principles Decisions by the national council were not binding on towns or individuals who wished to dissent Nevertheless, civil strife was almost unknown among them Under this system there was no private ownership of land, although crops were privately owned to a degree Each owner was required to contribute a certain portion for public use The Creek impressed the early white men (Hernando De Soto saw them in 1540) by their height, their proud bearing, and their love of ornament They were hostile to the Spanish and therefore friendly to the British in colonial days, but, frightened by white encroachment and fired by the teachings of the Shawnee chief TECUMSEH, they rebelled in the Creek War of 1813-14 They massacred a large number of whites and blacks at Fort Mims, and Andrew Jackson won part of his reputation by defeating them at the battle of Horseshoe Bend By a treaty signed in 1814 the Creek ceded approximately two thirds of their land to the United States, and subsequent cessions further reduced their holdings Eventually they were moved to the Indian Territory, where they became one of the Five Civilized Tribes A treaty signed by

the confederacy in 1889 permitted white settlement of their lands, and there was great bitterness among the Creek By the early 1970s there were some 17,000 Creek, most of them living in Oklahoma See J R Swanton, *The Early History of the Creek Indians* (1922) and *Social Origins and Social Usages of the Indians of the Creek Confederacy* (1928, repr 1970), Grant Foreman, *The Five Civilized Tribes* (new ed 1953, repr 1966), D H Corkran, *The Creek Frontier, 1540-1783* (1967)

Creeley, Robert, 1926-, American poet, b Arlington, Mass He has lived and worked in Europe and Latin America and taught English at various universities in the United States For a time he was editor of the *Black Mountain Review* Creeley's poems have an effect of purity and elegance, with their intentional reticence, brevity of development, and spare lyricism His works include *The Island* (1963), a novel, *Poems 1950-1965* (1965), *Selected Writings* (1966), and *Pieces* (1969)

creeper, common name for members of a family of small, inconspicuous birds related to wrens and nuthatches They are found in wooded regions of the temperate Northern Hemisphere A creeper spirals up a tree trunk using its long, stiff tail as a prop and searches out minute insects with its long, downward-curved beak, it then swoops to the base of another tree to begin again The most widely distributed member of the family is the brown creeper, *Certhia familiaris*, found in North America and Eurasia It is S in (13 cm) long, brown above and white below Other North American creepers are the Rocky Mt, Sierra, and California creepers Some WARBLERS are also called creepers, e.g., the honey creeper Creepers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Certhiidae

Creevey, Thomas (kré'vè), 1768-1838, English diarist His journals and letters record, from the viewpoint of a Whig member of Parliament and minor officeholder, the history and manners of the late Georgian period See the edition by John Gore (1948)

Creighton, Mandell (mān'dəl krī'tən), 1843-1901, British historian and churchman He was professor of ecclesiastical history at Cambridge from 1884 until his appointment (1891) as bishop of Peterborough In 1896 he was made bishop of London He was a founder of the *English Historical Review* and wrote biographies of Cardinal Wolsey, Queen Elizabeth I, and Simon de Montfort His masterwork was his *History of the Papacy during the Period of the Reformation* (5 vol, 1882-94, new ed, with title *History of the Papacy from the Great Schism to the Sack of Rome*, 6 vol, 1897, repr 1968) See biographies by his wife, Louise Creighton (2 vol, 1904), and W G Fallows (1964)

cremation, disposal of a corpse by fire It is an ancient and widespread practice, second only to BURIAL Although cremation was not practiced in ancient China or Egypt because of religious beliefs, it was noted in Greece as early as 1000 B C and was the predominant mode of disposition by the time of Homer Until the advent of Christianity as the dominant religion in the latter part of the Roman civilization, cremation was widely accepted Its use is often related to a belief in the properties of fire as a purifying agent Its object may also be to light the way of the deceased to another world, or to prevent the return of the dead More practical considerations include the fear of depredation by enemies and, in the modern world, the shortage of land in urban areas The earliest known method of cremation is the log pyre In more elaborate practices, pitch and gums are added to the wood In modern crematories the corpse is exposed not to flames but to intense heat that reduces the body to ashes Disposal of the ashes varies in different parts of the world Hindus, for whom cremation is the typical form of disposal, place them in urns or put them in a river, preferably the sacred Ganges Other methods include burial or scattering In the Western world the practice of cremation gained new favor with the rise of large cities and of the health hazard associated with crowded cemeteries In the late 19th cent the practice was legalized in several European countries and the first crematory in the United States was built Cremation is expressly forbidden by the Roman Catholic Church See SUTTEE For bibliography see FUNERAL CUSTOMS

Crémazie, (Joseph) Octave (zhōzé'f' òktāv' krāmāzé'), 1822-79, French Canadian poet, b Quebec, considered the father of French Canadian poetry With his brothers he was proprietor of a Quebec bookshop, the gathering place for a literary group that included such figures as F X GARNEAU

and H R CASGRAIN He and his friends founded a monthly magazine, *Les Soirées canadiennes*, devoted to the perpetuation of French Canadian folklore In 1855 his poem "Le Vieux Soldat canadien" appeared, bringing Crémazie instant fame His subsequent poems, which show the influence of French romanticism, are filled with patriotic feeling In 1862 the poet suffered business difficulties and fled to France, where he lived in poverty under an assumed name He wrote a journal of the siege of Paris (1870) and died at Le Havre See his *Œuvres complètes* (1883)

crème de menthe (krēm də mīnt, fr krēm də mānt), a mint-flavored LIQUEUR, either green or white, and often served with finely crushed ice

Cremer, Sir William Randal (krē'mər), 1828-1908, English pacifist At first active in trade unionism, he gradually expanded his work and interests, becoming one of the most active advocates of international arbitration In 1871 he became secretary of the Workmen's Peace Association, a position he held until his death For his efforts in the cause of international arbitration Cremer was awarded the 1903 Nobel Peace Prize He gave most of the stipend in trust to the International Arbitration League He was knighted in 1907 See biography by Howard Evans (1909, repr 1973)

Crémieux, (Isaac) Adolphe (ēsāk' ädōlf' krāmyō'), 1796-1880, Jewish-French statesman and political writer A lawyer, he served briefly as minister of justice in the provisional government of 1848 after the overthrow of King Louis Philippe He supported Louis Napoleon (later Napoleon III) for president, but opposed his coup d'état (Dec, 1851) and as a result was imprisoned temporarily in 1851 In 1870, after Napoleon III's fall, he became minister of justice in the government of national defense In this position he eliminated the death penalty for political offenders, abolished slavery in the colonies, and extended full French citizenship rights to the Jews of Algeria He was president (1876) of the Alliance Israélite Universelle, through which he advocated international Jewish emancipation and founded Jewish schools in Cairo and Alexandria

Cremin, Lawrence Arthur, 1925-, American educator and historian, b New York City He received his Ph D from Columbia in 1949 and began teaching at Teachers College, Columbia He became a member of the history department at Columbia in 1961 In that year Cremin also became Frederick A P Barnard professor of education at Teachers College, and in 1974 he was named president of the college An expert in the field of American educational history, he was commissioned by the U S Office of Education to write a comprehensive history of education in the United States The first volume, *American Education The Colonial Experience*, appeared in 1970 His other works include *Transformation of the School* (1961) and *The Genius of American Education* (1965)

Cremona (krīmō'nə, Ital krāmō'na), city (1971 pop 81,983), capital of Cremona prov, Lombardy, N Italy, on the Po River It is an agricultural market and an industrial center Originally (3d cent B C) a Roman colony, Cremona was in the Middle Ages an independent commune frequently at war with Milan until its surrender to that city in 1344 It was known in the Middle Ages as a center of learning, in the late Renaissance for a school of painting founded (16th cent.) by Giulio CAMPI, and later (17th-18th cent.) for the violins made by the AMATI, the GUARNERI, the STRADIVARI, and their successors The cathedral (12th-16th cent.), the tall campanile, the baptistery, the city hall (13th cent.), and the Soldiers' Loggia (13th cent.) adorn Cremona's impressive main square

creole (crē'ōl), Span criollo (crēōl'yō) [probably from crío=child], term originally applied in West Indies to the native-born descendants of the Spanish conquerors The term has since been applied to certain descendants in the West Indies and the American continents of French, Portuguese, and Spanish settlers The creoles were distinguished from the natives, the Negroes, and from people born in Europe A sharp distinction of interest always lay between the creoles, whose chief devotion was to the colony, and the foreign-born officials, whose devotion was to the mother country Never precise, the term acquired various meanings in different countries It has biological and cultural connotations The term was early adopted in the United States in Louisiana, where it is still used to distinguish the descendants of the original French settlers from the Cajuns, who are at least partially descended from the Acadian exiles The word is also commonly applied to things native to the New

World, such as creole cuisine and creole horses. The term is also used in places distant from the Americas, such as the island of Mauritius, but there it has lost much of its original meaning. The picturesque life of the Louisiana creoles has been ably depicted in the works of Lafcadio Hearn, George Washington Cable, and Grace King. See F. J. Woods, *Marginality and Identity* (1972).

creole language (krē'ōl'), any language that began as a PIDGIN but was later adopted as the mother tongue by a people in place of the original mother tongue or tongues. Examples are the GULLAH of South Carolina and Georgia (based on English), the creole of Haiti (based on French), and the Papiamentu of Curaçao (developed from pidgin Spanish and Portuguese).

Creon (krē'ōn), a name given to several minor legendary Greek kings. In the legend of Oedipus, Creon is the brother of Jocasta and after the death of Oedipus' sons becomes king of Thebes. In Euripides' *Medea*, Creon is the king of Corinth and is murdered by the vengeful Medea. Apollodorus portrays him as an early king of Thebes who purifies Amphitryon after the murder of his uncle.

creosote (krē'asōt), volatile, heavy, oily liquid obtained by the distillation of coal tar or wood tar. Creosote derived from beechwood tar has been used medicinally as an antiseptic and in the treatment of chronic bronchitis. Creosote obtained from coal tar is poisonous. It is used chiefly as a preservative for wood, e.g., in fence posts, railroad ties, and telephone poles, it provides protection against fungi, shipworms, and termites. Although wood may be treated by dipping it in hot creosote, greater protection is obtained if the creosote is forced into the wood under pressure.

crepe, thin fabric of crinkled texture, woven originally in silk but now available in all major fibers. There are two kinds of crepe. The hard-finished, typically dyed black and used for mourning (which tends to retain the old spelling *crape*), is made of hand-twisted silk yarn and finished by a rather complex trade process after weaving; the soft crepes include the Canton, or Oriental, weaves (crepes de Chine) in plain or damask weaves. Their crimped or wavy appearance results from the peculiar arrangement of the weft, which is formed of yarn from two different bobbins twisted together in opposite directions or uses alternately a right-twisted and a left-twisted thread.

crepe myrtle: see LOOSESTRIFE

Crépy, Treaty of (krāpē'), 1544, concluded by Holy Roman Emperor Charles V and King FRANCIS I of France at Crépy-en-Laonnois (formerly spelled Crespy), Aisne dept., N France. The emperor renounced his claim to the duchy of Burgundy and the king renounced his pretensions to Naples, Flanders, and Artois. In a secret treaty signed at the same time, Francis agreed to help the emperor suppress the German Protestants and to restore Geneva, where Calvin had established his state, to the duke of Savoy. He also agreed to support Charles against King Henry VIII.

Créquy or Créquy, François, chevalier de (frā'nsā' shavalyā' dā krākē'), c. 1629-87, marshal of France. Having fought in the Thirty Years War and on the government side in the Fronde, he conducted brilliant campaigns in the War of Devolution (1667-68) and conquered Lorraine in 1670. He refused (1672) to serve under Marshal Turenne in the third Dutch War (1672-78) and was exiled but soon submitted. In 1675, he was captured after his defeat at Konzer Brücke near Trier. Released shortly after, he achieved military renown in Alsace. In 1684, Créquy occupied Luxembourg.

Crerar, Henry Duncan Graham (krēr'ār), 1888-1965, Canadian general in World War II. He fought in World War I and later headed the Royal Military College. In 1940 he was made chief of the Canadian general staff. In 1941 he was given command of the Canadian 2d Division Overseas, in 1944 he became commander of the 1st Canadian Corps and was made a full general, serving with distinction during the campaigns in Europe. He retired in 1946.

Crerar, John (krēr'ār), 1827-89, American capitalist and philanthropist, b. New York City. Crerar was a manufacturer in Chicago, and gave liberally to many causes. He is remembered chiefly for the John Crerar Library, a scientific and technical reference library in Chicago, for which he provided in his will. The library has special collections on medicine, Chinese literature, Dutch history, floriculture, the history of the women's movement, trade unions, and social science in general. It is noted for its fine bibliographical work.

Crerar, Thomas Alexander, 1876-, Canadian political leader. Under his able direction the United Grain Growers, Ltd., of which he was president (1907-29), became one of the most successful farmers' cooperative movements in W. Canada. A Liberal, Crerar served (1917-19) as minister of agriculture in Sir Robert Borden's coalition cabinet, he resigned in protest against the government's high tariff policy. He was leader (1920-21) of the new National Progressive party and of the Progressives in the House of Commons, retiring in 1922 to private life. He reentered the political scene as minister of railways and canals (1929-30) in Mackenzie King's Liberal government and later served (1935-45) as minister of mines and resources in King's cabinet. In 1945, Crerar was appointed to the Canadian Senate, serving until 1966.

Cres (tsarēs'), Ital. *Cherso*, island (1961 pop. 4,113), 158 sq. mi. (409 sq. km), in the Adriatic Sea, off Croatia, NW Yugoslavia. Formerly in Austria-Hungary, it passed to Italy in 1918 and to Yugoslavia in 1947. Fruit growing, fishing, and sheep raising are the chief occupations.

Cresap, Michael (krēs'āp), 1742-75, American frontiersman and soldier, b. Allegany co., Md. An Indian fighter, he was accused by Thomas Jefferson and others of massacring the family of the friendly Indian chief Logan and thus starting (1774) Lord Dunmore's War. But this is denied by most modern historians who accept a letter from George Rogers Clark stating that Cresap was with him at the time of the massacre. Cresap fought in the war, and after the American Revolution began he became (1775) captain of a company of riflemen. Cresap drove his men at such a hard pace to support the patriots at Boston—traveling 550 mi. (885 km) in 22 days—that he died of exhaustion as a result. See biography by J. J. Jacob (1826, repr. 1971).

Crescents (krēs'anz), companion of Paul, a missionary in Galatia. 2 Tim. 4:10.

crescent, emblematic representation of the quarter moon. The crescent and star, ancient Byzantine symbols that became the emblems of Constantinople, were assumed as the standard of the Ottoman Turks after their capture of that city. The crescent surmounted by a cross indicates the origin of the Eastern Orthodox Church. The crescent appears on the flags of various present-day Muslim nations. The emblem is also used in blazonry.

Cresilas or Kresilas (both krēs'ilās), fl. c. 450 B.C., Greek sculptor, b. Crete. He worked at Athens. His statue of Pericles is the earliest Greek portrait statue that has been identified.

cresol (krēs'ōl), $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$, any one of three aromatic alcohols present in coal tar. The three compounds are structural isomers, they may be thought of as hydroxy derivatives of TOLUENE or as methyl derivatives of PHENOL. The names of the three compounds indicate which of the hydrogens on the benzene ring portion of the molecule have been replaced. Two adjacent hydrogens are replaced, one with a methyl group and one with a hydroxyl group, to form *ortho*-cresol, also called 2-hydroxytoluene, or 2-methylphenol. When a single unreplaced hydrogen lies between the two that are replaced, the compound formed is *meta*-cresol, 3-hydroxytoluene, or 3-methylphenol. When the replaced hydrogens lie opposite one another on the ring, the compound formed is *para*-cresol, 4-hydroxytoluene, or 4-methylphenol. Because the boiling points of these three compounds are nearly the same, a separation of a mixture of the three into its pure components is impractical. The mixture of cresols obtained from coal tar is called cresylic acid. The cresols are used in the manufacture of disinfectants and synthetic resins.

Crespi, Giovanni Battista (jōvān'ē bat-tēs'ta krās-pē), c. 1575-1632, Italian painter, sculptor, and architect of the Milanese school. He was also called Il Cerano. His paintings are imbued with a highly dramatic religious fervor, described by broad areas of light and shadow and a warm palette. Much of his work is in the Cathedral of Milan, for which he executed paintings of the life of St. Charles Borromeo, and where he became head of the statuary works in 1629.

Crespi, Giuseppe Maria (jōzēp'pā mārē'a), 1665-1747, Italian painter of the Bolognese school, called Lo Spagnuolo. He is well represented in and around Bologna. His best-known works are the imposing paintings of the *Seven Sacraments* (1712, Dresden), but he is also noted for his spontaneous rendering of genre scenes. The National Gallery of Art, Washington, D.C., has his *Cupids with Sleeping Nymphs* and other paintings.

Crespi, Juan (hwan), 1721-82, Spanish explorer in the Southwest, a Franciscan. He came to America in 1749, and in 1767 he went to the peninsula of California in charge of Mission Purísima Concepción. In 1769 he joined the expedition of Gaspar de Portolá to occupy San Diego and Monterey and continued up the coast with Portolá. The following year he founded the Mission San Carlos Borromeo, in the present-day Carmel-by-the-Sea, which became his headquarters. He was chaplain of the expedition to the N. Pacific conducted by Juan Pérez in 1774. His diaries, published in H. E. Bolton's *Fray Juan Crespi* (1927, repr. 1971), provided valuable records of these expeditions.

Crespin, Régine (rāzhēn' krēs-pān'), 1927-, French soprano. She made her debut at the Paris Opera in 1951 as Elsa in Wagner's *Lohengrin*. The range, flexibility, and richness of her voice were critically acclaimed after her performance as Kundry in Wagner's *Parsifal* at Bayreuth in 1958. In 1962 she made her American debut at the Metropolitan Opera, singing the Marschallin in Richard Strauss's *Der Rosenkavalier*. She is also noted for her performances in such roles as Charlotte in Massenet's *Werther* and Dido in Berlioz's *The Trojans*.

Crespo, Joaquín (hwakēn' krās-pō), 1841?-1898, president of Venezuela (1884-86, 1894-98). He served his first term under the dominance of Antonio GUZMAN BLANCO. In 1892 he led a revolt and established a military dictatorship. His second term was noted for the bitter feelings between the United States and England brought about by the Venezuela Boundary Dispute. When he chose his successor, revolts occurred, and Crespo was killed in the fighting. The next year Cipriano Castro came into power.

Crespy: see CRÉPY, TREATY OF

cross, name for several plants often used for salads, e.g., the WATERCRESS, garden cress or PEPPERGRASS, and Indian cress or NASTURTIUM.

Cressent, Charles (sharl krēsān'), 1685-1768, French cabinetmaker, one of the chief creators of the RÉGENCE STYLE. Although at first a sculptor and bronze craftsman, he studied under the furniture designer Boulle and became official cabinetmaker to the regent Philippe II, duc d'Orléans. Examples of his furniture display a strong and majestic beauty, with subtly curving supports and swelling surfaces. Against their veneers of mahogany and ebony stand lavish relief adornments in superbly modeled gilt bronze—the scrolls, shells, female busts, and dragons typical of regence decoration. Pieces by Cressent are in the Louvre and in the Wallace Collection, London.

Cressida: see TROILUS and CRESSIDA

Cressy, Hugh Paulinus (krēs'sē), 1605-74, English Benedictine monk. He was educated at Oxford and converted to Roman Catholicism in Rome in 1646. His *Exomologesis* (1647) is an apologia for his conversion. His most ambitious work, however, is his *Church History of Brittany, or England* (1668), one of the first attempts at objective church history. He edited the work of several Catholic mystics—Walter Hilton's *Scale of Perfection*, Friar Augustin Baker's *Sancta Sophia*, and the *Revelations of Divine Love* by Juliana of Norwich. Cressy served as chaplain to Catherine of Braganza, wife of Charles II.

crest, in feudal livery, an ornament of the headpiece that afforded protection against a blow. The term is incorrectly used to mean family coat of arms. Crests were widely used in the 13th cent. by feudal chiefs, as they had been by ancient Greek warriors and the Roman centurions. The earlier forms were usually of stuffed leather, gilded, silvered, or painted, later they were of wood or metal. The crest came to be used in HERALDRY, first only by persons of high rank, then by all those entitled to a coat of arms. It surmounts the escutcheon, its colors are those of the coat of arms. The dragon, wyvern, and plume of feathers are common crests. The lion, used by Edward III of England, remains the crest of the English sovereigns. See also BLAZONRY.

crested swift: see SWIFT

Creston, Paul, 1906-, American composer, b. New York City as Joseph Guttoveggio. Creston was largely self-taught in composition. His music is generally tonal and conservative. Among Creston's many works are five symphonies (1941-56), *Two Choric Dances* (1938) for orchestra, two violin concertos (1956, 1970), a concerto for marimba (1940), and a concerto for alto saxophone (1944). Creston is the author of *Principles of Rhythm* (1964).

Crestwood, city (1970 pop. 15,398), St. Louis co., E. central Mo., a suburb of St. Louis, inc. as a city 1949. Located in a truck-farming area, it is mostly residential with some light industry. The Thomas Sapping-

ton House (1808, restored 1965) is a good example of Federal architecture

Creswell, John Angel James, 1828–91, US Postmaster General (1869–74), b Port Deposit, Md He was a lawyer, US Representative (1863–65), and US Senator (1865–67), but his important work was done later as Postmaster General He reorganized the Post Office Dept to meet the expanding needs of the United States One-cent post cards were introduced, postal treaties were revised, postal laws were recodified, money-order business was facilitated, free delivery was extended, methods of contracting with railways were improved, and the franking privilege was limited Some reforms that Creswell advocated, such as a postal savings bank and postal telegraph, were adopted later

Cretaceous period (krĭt'ā'shəs), third and last period of the MESOZOIC ERA of geologic time (see GEOLOGIC ERA, table) The Cretaceous was marked, both in North America and in Europe, by extensive submergences of the continents Changes both in the earth's surface and in its flora and fauna brought the Mesozoic to a close At the beginning of the Lower Cretaceous in North America, the Mexican sea of the late JURASSIC PERIOD spread over Texas, depositing the Trinity sandstone and limestone Retreating at the end of Trinity time, it returned in Fredericksburg time and inundated Texas, Oklahoma, New Mexico, and parts of Arizona, Kansas, and Colorado It reached its maximum late in Fredericksburg or early in Washita time, and was drained by a general emergence of land, which brought the Lower Cretaceous to a close Fredericksburg and Washita deposits were chiefly limestone, but some continental sediments (i.e., sandstone, shale, and conglomerate) mark the late Washita emergence The Comanchean series of rocks (Trinity, Fredericksburg, and Washita) reaches a thickness of some 1,500 ft (460 m) in central Texas, and is several times as thick in Mexico The Comanchean seas were probably separated by a land barrier from contemporaneous seas in the California area, where 26,000 ft (7,925 m) of Shastan shales, with sandstone and thin limestone, were laid down The sediments were by rapid erosion from the recently elevated Sierra Nevada and Klamath mts In Montana, Alberta, and British Columbia the Kootenai deposits of sandstone and sandy shale, which contain workable deposits of good coal, were formed, along the Atlantic coast the unconsolidated sandy clay, gravel, and sand of the Potomac series were deposited The Upper Cretaceous opened in W North America with the deposition of continental sands (now the Dakota sandstone) over the surface exposed by the Washita retreat Some of these sands were redistributed by the Colorado sea, which, advancing from Mexico, finally extended to the Arctic The eastern border of this, the greatest of North American Mesozoic seas, passed through Texas, Kansas, NW Missouri, Iowa, Minnesota, SW Ontario, Manitoba, Saskatchewan, and Mackenzie, while the western border crossed Arizona, Utah, E Idaho, W Montana, British Columbia, Yukon, and NE Alaska Branches extended eastward into the Gulf and Atlantic coast regions and southward over Mexico and Yucatan The Colorado deposits are composed chiefly of shales and limestone, but there is chalk in Kansas and South Dakota Slight shifting of the sea was followed by the deposition of the Montana shale and sandstone and then by withdrawal of the sea In Laramide time conditions in the West were similar to those of the CARBONIFEROUS PERIOD in other regions swamps and bogs were formed which later became valuable deposits of COAL In the Gulf region the Upper Cretaceous progression of rocks is from nonmarine sand and clay, with lignite, to marine sands, chalk or soft limestone, and continental sand, with clay On the Atlantic coast the late Upper Cretaceous is represented by continental sands, gravel, and clay, with lignite, followed by clays and sands with glauconitic greensands The Pacific Coast Upper Cretaceous is marine sandstone and shale, with local conglomerate and coal At the close of the Cretaceous occurred the Laramide revolution—at least two different epochs of mountain building and one of relative quiet In this disturbance the Rockies and the E Andes were first elevated, and there were extensive flows of lava The Appalachians, which had been reduced almost to base level by erosion, were rejuvenated, and the seas retreated from all parts of the continent The intermittent character of the Laramide disturbance makes difficult the demarcation of the Mesozoic and the succeeding CENOZOIC ERA The lower Cretaceous opened in NW Europe with the deposition of a continental and freshwater formation the Wealden sand and clay, best displayed in

England The sea, meanwhile, expanded from the Mediterranean, finally overlaying successive Wealden strata with limestone There was at the same time an extensive sea in N Europe At the close of the Lower Cretaceous, there was probably some recession of the seas In the Upper Cretaceous, a great transgression of seas submerged lands which had been emergent since the Paleozoic The striking feature of the European Upper Cretaceous is a great chalk deposit, now exposed in the cliffs of the English Channel In India, the late Upper Cretaceous was marked by an overflow of lava in the Deccan plateau The area covered by igneous rocks dating from this period now comprises over 200,000 sq mi (518,000 sq km) and was formerly much larger, having been reduced by erosion Near Bombay the formation is 10,000 ft (3,000 m) thick The Lower Cretaceous is characterized by a revolution in the plant life with the sudden appearance of flowering plants (angiosperms), such as the beech, fig, magnolia, and sassafras By the end of the Cretaceous such plants were dominant, the willow, elm, grape, laurel, birch, oak, and maple having made their appearance, besides grass and the sequoias of California This prepared the way for the dominance of mammals in Cenozoic animal life The marine invertebrates of the Cretaceous included nautilus, barnacles, lobsters, and crabs, sea urchins and foraminifers were common, ammonites, though plentiful, were increasingly degenerate Reptiles reached their climax New kinds of dinosaurs were Triceratops, Tyrannosaurus, Stegosaurus, Brontosaurus, and Iguanodon Flying reptiles were highly developed, while in the sea there were ichthyosaurs, plesiosaurs, and mosasaurs However, by the end of the Cretaceous the dinosaurs became extinct The rather abrupt disappearance of dinosaurs and other forms of Cretaceous life remains a mystery The decline in dinosaurs was accompanied by a rise in the mammals, but since the mammals were initially small, it does not appear likely that they were superior predators Changes in vegetation suggest that the ecological food chain for the large reptiles was disrupted, although this hypothesis is difficult to reconcile with the simultaneous disappearance of huge sea-dwelling reptiles A worldwide atmospheric change in the oxygen-carbon dioxide ratio may have occurred, caused by the rapid rise of modern plants and other life forms and resulting in climatic changes with which the large dinosaurs could not cope Of other reptiles there were crocodiles and turtles, while snakes and lizards made their first appearance The climate of the Cretaceous was apparently fairly mild and uniform, but it is possible that toward the end of the period some variant zones of climate had appeared By the end of the Cretaceous period, South America and Africa had separated, with the consequent widening of the S Atlantic The N Atlantic continued to widen, although it appears that Europe, Greenland, and North America were still connected Madagascar had separated from Africa, while India was still drifting northward toward Asia Antarctica and Australia had yet to separate

Cretan bull, in Greek mythology, giant bull that Hercules captured as his seventh labor Some versions of the legend state that this bull was the same one that carried Europa to Crete, others claim that it was the beautiful white bull loved by Pasiphaë

Crete (krĕt), Gr *Krīti*, island (1971 pop 456,642), c 3,235 sq mi (8,380 sq km), SE Greece, in the E Mediterranean Sea, c 60 mi (100 km) from the Greek mainland The largest of the Greek islands, it extends c 160 mi (260 km) from east to west and marks the southern limit of the Aegean Sea, the southern part of which is also called the Sea of Crete IRÁKLION is the capital of the Crete governorate and is the island's largest city, KHANIA is the only other large city The rocky northern coast of Crete is deeply indented, and the interior is largely mountainous, culminating in Mt Ida (8,058 ft/2,456 m) Crete has many small farms, whose chief crops are grains, olives, and oranges, and food processing is its main industry Sheep, goats, and dairy cattle are also raised The island has few mineral deposits Transportation facilities are very limited Crete had one of the world's earliest civilizations, the MINOAN CIVILIZATION, named after King Minos, the legendary author of Cretan institutions, in the ruined palace at CNOSSUS invaluable finds have been made The Cretan kingdom reached its greatest power, prosperity, and civilization c 1600 B C Later, for reasons still obscure, its power suddenly collapsed, but Crete flourished again after the Dorian Greeks settled on the island in large numbers and established city-states Among the most powerful of the cities (110 in num-

ber, according to Homer) were Cnossus and Cydonia (modern Khania) Although important as a trade center, Crete played no significant part in the political history of ancient Greece It became a pirate haven in the 3d cent B C but was conquered (68 B C–67 B C) by the Romans under Quintus Metellus It passed (A D 395) to the Byzantines, fell (824) to the Arabs, but was reconquered by Nicephorus Phocas (later Nicephorus II) in 961 As a result of the Fourth Crusade, the island passed to Venice in 1204, and in 1212, after expelling rival Genoese colonists, the Venetians set up a new administration, headed by a duke Under Venetian rule Crete was generally known as Candia (Iraklion) for the duke's residence Insurrections against the arbitrary Venetians were frequent, and the Cretans were not displeased at changing masters when the Ottoman Turks conquered (1669) virtually the whole island after a 24-year war Two offshore island fortresses remained in Venetian hands until 1715 A series of revolts against the Turks in the 19th cent reached a climax in the insurrection of 1896–97 that led to war (1897) between Greece and Turkey The European powers intervened in the war, forcing Turkey to evacuate (1898) Crete An autonomous Cretan state was formed under nominal Turkish rule, but it was governed by a high commission of the occupying powers (England, France, Russia, and Italy) The Cretan national assembly, led by Eleutherios VENIZÉLOS, declared in favor of union with Greece, but the powers rejected its demand The Young Turk revolution of 1908, however, enabled the Cretans to proclaim their union with Greece, and in 1909 foreign occupation troops were withdrawn Cretan representatives were admitted to the Greek parliament in 1912, and in 1913, as a result of the Balkan Wars, Crete was officially incorporated into Greece The followers of Venizelos controlled Crete during their uprising (1935) against the imminent restoration of the monarchy but were defeated by Gen George Kondylis A new revolt (1938) against the dictatorship of John Metaxas was also suppressed In World War II, Crete was used as a British military and naval base late in 1940 The British and Greek forces on the Greek mainland evacuated to Crete in 1941, but they were quickly overwhelmed by the Germans in a large-scale airborne invasion, the first of its kind Late in 1944, British ships isolated the German occupation troops, who eventually surrendered In the postwar period there was some Communist guerrilla activity on the island See R F Willetts, *Ancient Crete* (1965), J S Bowman, *Crete* (1969), K Bramgan, *The Foundations of Palatial Crete* (1970) See also bibliographies under AEGEAN CIVILIZATION and MINOAN CIVILIZATION

Créteil (krā'tē), city (1968 pop 49,233), capital of Val-de-Marne dept., N central France, on the Marne River Gold and silver items, pencils, and varnish are produced A church built in the 12th and 13th cent is in Créteil

cretinism, condition produced in infants and children due to lack of thyroid hormone It usually results from a congenital defect (e.g., absence of the thyroid, presence of only a rudimentary gland, inability of the gland to produce thyroxine) However, it can develop later if there is a lack of iodine in the diet, or if the thyroid is diseased or surgically removed Cretinism causes very serious retardation of physical and mental development, if the condition is left untreated, growth is stunted and the physical stature attained is that of a dwarf In addition, the skin is thick, flabby, and waxy in color, the nose is flattened, the abdomen protrudes, and there is a general slowness of movement and speech If discovered early enough and treated with thyroid extract and sufficient iodine intake throughout life, growth may become normal and mental facility greatly improved If the condition commences after adulthood is reached it is called MYXEDEMA

Creusa (krēō'sa), in Greek mythology 1 Daughter of Erechtheus and wife of Xuthus Her sons, Achilles by Xuthus, and Ion by Xuthus or Apollo, are the ancestors of the Achaeans and the Ionians 2 Princess of Corinth see JASON and MEDEA 3 Daughter of Priam and wife of Aeneas She died fleeing from Troy

Creuse (krōz), department (1968 pop 156,876), central France, in the MASSIF CENTRAL GUÉRET (the capital) and AUBUSSON are the chief towns

Creusot, Le (lə krōzō'), city (1968 pop 34,102), Saône-et-Loire dept., E central France, in Burgundy Situated in a coal-mining region, it is the site of the large Schneider iron and steel mills and munitions factories (founded 1837)

crevasse (kravās'), large crack in the upper surface of a GLACIER, formed by tension acting upon the brittle ice. Transverse crevasses occur where the grade of the glacier bed becomes suddenly steeper, longitudinal crevasses, where the glacier spreads over a wider valley or plain. Marginal crevasses are due to the strain built up when the central part moves faster than the sides.

Crevecoeur, J Hector St. John (krēv'kor'), 1735-1813, American author and agriculturist, b. France as Michel Guillaume Jean de Crèvecoeur. It is believed that he served under Montcalm in Canada. After traveling in the Great Lakes region and in the Ohio valley and working as a surveyor in Pennsylvania, he settled (c 1769) on a farm in Orange co., N.Y., where he wrote *Letters from an American Farmer* (1782). Other letters, found in 1922, were published as *Sketches of Eighteenth Century America* (1925). The two books give outstanding descriptions of American rural life of the period. He wrote, over the signature Agricola, agricultural articles for American newspapers. He introduced the culture of European crops, notably alfalfa, into America and of the American potato into Normandy. As French consul in New York City (from 1783) he sought to improve commercial relations between France and the United States. He lived in France from 1790. See biography by T. L. Philbrick (1970).

Crewe, Robert Offley Ashburton Crewe-Milnes, 1st marquess of (krōo'milz'), 1858-1945, British statesman. He succeeded (1885) his father as Baron Houghton and was created earl (1895) and later marquess (1911) of Crewe. A Liberal, he held a succession of high offices, including those of lord lieutenant of Ireland (1892-95), colonial secretary (1908-10), and secretary for India (1910-15). As Liberal leader in the House of Lords from 1908 he played an important role in securing passage of the Parliament Act of 1911, which deprived the Lords of its veto. He was later ambassador to France (1922-28). See biography by James Pope-Hennessy (1955).

Crewe (krōē), municipal borough (1971 pop 51,302), Cheshire, W central England. It is an important railroad junction with large locomotive and car works.

cribbage (krīb'ij), card game played by two persons with a deck of 52 cards and a scoring (pegging) device known as a cribbage board. The board contains four rows of 30 holes each (two rows for each player), plus additional holes, called game holes. Each player gets two pegs to keep the score. The English poet Sir John Suckling (1609-42) is credited with inventing and naming the game. Each king (high card), queen, jack, and ten represents a count of 10 points, each ace, a count of 1, each other card, its index value. Each player receives six cards and lays away two face down to form the crib. The stock is cut by the dealer to produce the starter. Cards are placed face up alternately, nondealer first, in front of the player, who announces the total count. The object of each series is to carry the total of the cards to 31 or as close as possible without exceeding it. A player pegs 1 for laying down the last card in a series before reaching 31, or he pegs 2 for adding a card that makes exactly 31. Points also are scored for making the count 15 and for playing cards in sequence or in pairs. When all the cards have been played, each player pegs additional points for the pairs, sequences, and counts of 15 that can be arranged from the cards in his hand and the starter, the dealer also pegs the score in the crib. Several hands are played until the game is reached when one player pegs 61 points (once around the board) or 121 points (twice around). See Douglas Anderson, *All about Cribbage* (1971).

Crichton, James (krī'ton), 1560?-1583?, Scottish adventurer and scholar, called the Admirable Crichton. A graduate of the Univ. of St. Andrews, he spent some time in France, possibly in military service. By 1579 he was in Italy, where he attracted attention by his scholarly accomplishments and personal charm. Reputedly he spoke 12 languages and displayed amazing erudition and powers of memory in public disputations. He entered the service of a Mantuan nobleman as tutor to his son and was slain by his charge in a street brawl. His fame is due to the extravagant praise given him by Aldus Manutius (grandson of the famous printer of the same name) and by his 17th-century biographer, Sir Thomas Urquhart.

Crick, Francis Harry Compton, 1916-, English scientist, grad. University College, London, and Caius College, Cambridge. From 1940 to 1947 he served as a scientist in the admiralty. He was a visiting lecturer at several institutions in the United States including

Brooklyn Polytechnic (1953-54), Harvard (1959), Univ. of Rochester (1959), and Johns Hopkins school of medicine (1960). He shared the 1962 Nobel Prize in Medicine and Physiology with Maurice Wilkins and James Watson for their work in establishing the structure and function of deoxyribonucleic acid (DNA), the key substance in the transmission of hereditary characteristics from generation to generation. See his *Of Molecules and Men* (1967) and J. D. Watson, *The Double Helix* (1968).

cricket, common name of the slender, chirping, hopping INSECTS forming the family Gryllidae in the order Orthoptera. Most crickets have long antennae, muscular hind legs for jumping, and two pairs of fully developed wings. In some subfamilies the wings are reduced or absent. In most subfamilies the males have song-producing, or stridulatory, organs on the front wings. Both sexes possess auditory organs on the forelegs. The stridulatory apparatus is most highly developed in the field crickets and the tree crickets. Members of these subfamilies have a ridged region, which acts as a file, and a hardened region, which acts as a scraper, on each front wing, sound is produced by rubbing the wings together. Crickets occur mostly in the temperate climates. The common field crickets of the United States are species of the genus *Gryllus*, all are brown to black, about 1 in. (2.5 cm) long, and are found in fields and meadows and often in houses. The tree crickets are slender, pale green or whitish insects of trees and shrubs, most U.S. species belong to the genus *Oecanthus*. The rate of chirping of tree crickets increases with increasing temperature. In the snowy tree cricket, *Oecanthus fultoni*, this variation is so regular that if the number 40 is added to the number of chirps per 15-sec interval, the sum is a fair approximation of the temperature in degrees Fahrenheit. Ant-loving crickets are tiny wingless forms $\frac{1}{8}$ in. to $\frac{1}{4}$ in. (3-5 mm) long that occur in ant nests, where they feed on an oily secretion produced by the ants. Unusual crickets are the mole crickets of the genus *Gryllotalpa*. These nocturnal insects have strong front legs adapted for digging and burrowing rather than strong hind legs for jumping. They live in moist soil. Crickets reproduce sexually, producing from one to three generations per year. The females usually lay eggs in the ground or in soft-stemmed plants during the late summer or fall. The eggs hatch in the spring and the emerging young are similar to the adults except for their smaller size and lack of wings. In addition to the true crickets of the family Gryllidae, some insects of the long-horned GRASS HOPPER family (Tettigoniidae) are also called crickets. These are the cave, or camel, crickets, found throughout the world in dark, moist places, and the stone, sand, or Jerusalem crickets of W North America, found under stones in sandy soil. True crickets belong to the phylum ARTHROPODA, class Insecta, order Orthoptera, suborder Ensifera, family Gryllidae.

cricket, summertime ball and bat game played chiefly in Great Britain and the Commonwealth countries. It is played by two opposing teams of 11 men each on a level, closely cut, green turf preferably measuring about 525 ft (160 m) by about 550 ft (170 m). Two wickets are placed 66 ft (20.12 m) apart near the middle of the field. A wicket consists of two small wooden crosspieces known as bails resting on three wooden stumps 28 in. (71.1 cm) high. At each wicket stands a batsman. If the bowler of the opposing team knocks down the bails of the wicket opposite him, the batsman defending that wicket is retired. In bowling the hard, leather-covered ball, the bowler may not bend his arm, and the ball usually approaches the batsman on one bounce. When the bowler has bowled the ball six times (eight in Australia and South Africa) to the batsman at one wicket, an umpire (there is one at each wicket) calls "over," and another bowler begins bowling to the batsman's partner at the other wicket. The players in the field shift their positions according to which batsman is batting. For his part, the batsman tries to hit the ball with his paddle-shaped bat far enough so that he and his partner may run to exchange places, thereby scoring a run. When the ball is hit for a long distance (in any direction, since there are no foul lines in cricket), several exchanges or runs may be made. (If the ball reaches the boundary of the field on the ground, four runs are scored without the batsmen having to run, similarly, if the ball clears the boundary in the air, six runs are added to the score.) However, if the opposing team recovers the ball in time to knock down the bails of a wicket before the batsman reaches it, he is out. A batsman is also retired if the ball he hits is caught on the fly (as in baseball), and

he may be retired for several other more technical reasons. An outstanding batsman may score more than 100 runs, a "century," before being retired, and totals in the 400s have been posted. A game consists of two innings, in one inning all the men of each team bat once in a fixed order (unless a team chooses to retire without completing its batting order), it may take several days to complete one game. The team scoring the most runs wins. Except in case of serious injury, no substitutions are allowed. The origin of cricket is obscure. Some contend that it was invented in France as a derivative of croquet. Most evidence, however, suggests that cricket was developed in medieval England (c 12th-13th cent.). In 1744 the London Cricket Club drew up the first authoritative set of rules. The Marylebone Cricket Club (founded 1787) is one of the world's oldest cricket organizations and is still the international governing body of the game. In Great Britain the principal cricket matches are those between the universities (especially Oxford and Cambridge) and between the largely professional teams representing the English counties. International, or test, matches are played annually, the most famous contest being that between Australia and Britain for the "Ashes." After Australia's surprising victory in the 1882 competition, London's *Sporting Times* displayed an obituary for British cricket whose final lines read "The body will be cremated, and the ashes taken to Australia." The following year the British vowed to retrieve "the ashes," thus was born the unusual name of this famous sporting event. In the United States the game was supplanted in popular favor by baseball, a sport derived in part from cricket. See *Wisden Cricketers' Almanack* (1864-), Rowland Bowen, *Cricket: A History* (1970), John Ford, *Cricket: A Social History, 1700-1835* (1972), Gordon Ross, *The History of Cricket* (1972), Peter Smith, *The Observer's Book of Cricket* (1973).

Crile, George Washington (krīl), 1864-1943, American surgeon, b. Coshocton co., Ohio, M.D. Univ. of Wooster medical school (later merged with Western Reserve Univ.), 1887. He taught at the Univ. of Wooster (1889-1900) and at Western Reserve Univ. (1900-1924) and was a founder and director (from 1921) of the Cleveland Clinic Foundation. He worked on hemorrhage and transfusion, surgery of the thyroid, and shock, developing the technique of anociassociation to prevent surgical shock. His works include *Diseases Peculiar to Civilized Man* (1934), *Phenomena of Life* (1936), and *Intelligence, Power, and Personality* (1941).

Crillon, Louis des Balbes de Berton de (lwē dā balb dā bērtōn' dā krēyōn'), c 1541-1615, French soldier. He fought under François de Guise in the retaking (1558) of Calais, served in the first wars against the Huguenots (1562-70), and fought under John of Austria in his Turkish campaign. Crillon distinguished himself at Lepanto (1571). He sided with King Henry III against the Catholic LEAGUE and was one of the best captains of King Henry IV, under whom he took part in the battle of Ivry and the siege of Paris.

Crime, see CRIMINAL LAW, CRIMINOLOGY, GANG JUVENILE DELINQUENCY, ORGANIZED CRIME.

Crimea (krīmē'ə), Rus and Ukr. *Krym*, peninsula (1970 pop 1,814,000), c 10,000 sq mi (25,900 sq km), extreme S European USSR, linked with the mainland by the Perekop Isthmus. The peninsula, administratively part of the Ukraine, is coterminous with the Crimea oblast, of which SIMFEROPOL is the capital. Other major cities include SEVASTOPOL, KERCH, FEO DOSIYA, YALTA, and YEVPAATORIYA. The peninsula is bounded on the S and W by the Black Sea. The eastern tip of the Crimea is the Kerch peninsula, separated from the Taman peninsula (a projection of the mainland) by the Kerch Strait, which connects the Black Sea with the Sea of Azov. Along the Crimea's northeast shore are a series of shallow, stagnant, but mineral-rich lagoons, known collectively as the Sivash or Putrid Sea, which are linked to the Sea of Azov by the Arabatskaya Strelka. The northern part of the Crimea is a semiarid steppe, drained by a few streams, this region supports fine wheat, corn, and cotton crops. In the south rises the Crimean or Yaila Range (Yailinskaya Yaila), with its extensive meadows and forests. The tallest peak rises to c 5,000 ft (1,520 m). Protected by steep mountain slopes, the Black Sea littoral, called the "Soviet Riviera," has a subtropical climate and numerous resorts, notably at Yalta and Sochi. In this region are vineyards and fruit orchards, fishing, mining, and the production of essential oils are also important. Heavy industry in the Crimea includes ironworks and plants producing machinery, chemicals, and building materials. In the Crimean Range is one of the USSR's chief

astronomical observatories. Known in ancient times as Tauris, the peninsula was the home of the Cimmerian people, called the Tauri. Expelled from the steppe by the Scythians in the 7th cent. B.C., they founded (5th cent. B.C.) the kingdom of Cimmerian Bosphorus, which later came under Greek influence. Ionian and Dorian Greeks began to colonize the coast in the 6th cent., and the peninsula became the major source of wheat for ancient Greece. In the 1st cent. B.C., the kingdom of Pontus began to rule the Greek part of the peninsula, which became a Roman protectorate in the 1st cent. A.D. Its Greek name was then Latinized into Chersonesus Taurica. During the next millennium the area was overrun by Ostrogoths, Huns, Khazars, Cumans, and in 1239, by the Mongols of the Golden Horde. Meanwhile, the southern shore was mostly under Byzantine control from the 6th to the 12th cent. Trade relations were established (11th-13th cent.) with Kievan Russia. In the 13th cent. Genoa founded prosperous coastal commercial settlements. After Tamerlane's destruction of the Golden Horde, the Tatars established (1475) an independent khanate in N and central Crimea. In the late 15th cent. both the khanate and the southern coastal towns were conquered by the Ottoman Empire, the Turks called the peninsula Crimea. Although they became Turkish vassals, the Crimean Tatars were powerful rulers who became the scourge of the Ukraine and Poland, exacted tribute from the Russian czars, and raided Moscow as late as 1572. Russian armies first invaded the Crimea in 1736. Empress Catherine II forced Turkey to recognize the khanate's independence in 1774, and in 1783 she annexed it outright, the annexation was confirmed by the Treaty of Jassy (1792). Many Tatars, with their Muslim religion and Turkish language, emigrated to Turkey, while Russians, Ukrainians, Bulgarians, Germans, Armenians, and Greeks settled in the Crimea. During the CRIMEAN WAR (1853-56), parts of the remaining Tatar population were resettled in the interior of Russia. After the Bolshevik Revolution (1917) an independent Crimean republic was proclaimed, but the region was soon occupied by German forces and then became a refuge for the White Army. In 1921 a Tatar Autonomous Soviet Socialist Republic was created (Tatars then constituted about 25% of the population). During World War II, German invaders took the Crimea after an eight-month siege. Accused by the Soviet government of collaborating with the Germans, the Crimean Tatars were forcibly removed from their homeland after the war and resettled in distant parts of the Asian USSR. The republic itself was dissolved (1945) and made into an oblast of the Russian Soviet Federated Socialist Republic, in 1954 it was transferred to the Ukraine. Russians and Ukrainians now constitute most of the Crimea's population.

Crimean War (krīmē'ən), 1853-56, war between Russia on the one hand and Turkey, England, France, and Sardinia on the other. The causes of the conflict were inherent in the unsolved EASTERN QUESTION. The more immediate occasion was a dispute between Russia and France over the Palestinian holy places. Challenging the claim of Russia to guardianship of the holy places, France in 1852 secured from Sultan ABD AL-MAJID certain privileges for the Latin churches. Russian counterdemands were turned down (1853) by the Turkish government. In July, 1853, Russia retorted by occupying the Turkish vassal states of Moldavia and Wallachia, and in October, after futile negotiations, Turkey declared war. In March, 1854, England and France, having already dispatched fleets to the Black Sea, declared war on Russia. Sardinia followed suit in Jan., 1855. Austria remained neutral, but by threatening to enter the war on the Turkish side forced Russia to evacuate Moldavia and Wallachia, which were occupied (Aug., 1854) by Austrian troops. In Sept., 1854, allied troops landed in the Crimea, with the object of capturing SEVASTOPOL. The Russian fortress, defended by TOTLEBEN, resisted heroically until Sept., 1855. Allied commanders were Lord RAGLAN for the British and Marshal Saint-Arnaud, succeeded later by Marshal Canrobert, for the French. Military operations, which were marked on both sides by great stubbornness, gallantry, and disregard for casualties, remained localized. Famous episodes were the battles of BALAKLAVA and INKERMAN (1854) and the allied capture (1855) of MALAKHOV and Redan, which preceded the fall of Sevastopol. On the Asiatic front the Russians gained advantages and occupied Kars. The accession (1855) of Czar Alexander II and the capture of Sevastopol led to peace negotiations that resulted (Feb., 1856) in the Treaty of Paris (see PARIS CONGRESS OF). The Crimean War ended the dominant role of Russia in SE Europe, the cooling of Aus-

tro-Russian relations was an important factor in subsequent European history. The scandalous treatment of the troops, particularly the wounded, depicted by war correspondents, prompted the work of Florence NIGHTINGALE, which was perhaps the most positive result of the war. See Peter Gibbs, *Crimean Blunder* (1960), W. B. Pemberton, *Battles of the Crimean War* (1962), J. Langdon-Davies, *Crimean War* (1964), A. J. Barker, *The War Against Russia 1854-6* (1970).

criminal law, the branch of law that defines crimes, treats of their nature, and provides for their punishment. A TORT is a wrong committed against an individual, a crime, on the other hand, is regarded as an offense committed against the public, even though only one individual may have been wronged. The real distinction lies in the way a remedy for the wrong is pursued. A tort is a wrong for which the remedy is pursued by, and at the discretion of, the injured individual or his representative, while a crime is a wrong for which the wrongdoer is prosecuted by the state for the purpose of punishment. However, the fact that a particular act has been or may be prosecuted as a crime does not necessarily preclude an injured party from seeking recovery from the offender in a civil action. Crimes are usually classified as TREASON, FELONY, and MISDEMEANOR. The fundamental distinction between felonies and misdemeanors rests with the penalty and the power of imprisonment. In general, a misdemeanor is an offense for which a punishment other than death or imprisonment in the state prison is prescribed by law. The term "degree of crime" refers to distinctions in the culpability of an offense because of the circumstances surrounding its commission. Crimes are sometimes divided according to their nature into crimes mala in se and crimes mala prohibita, the former class comprises those acts that are thought to be immoral or wrong in themselves, or naturally evil, such as murder, rape, arson, burglary, larceny, and the like, the latter class embraces those acts that are not naturally evil but are prohibited by statute because they infringe on the rights of others (e.g., acts in restraint of trade that have been made criminal under antitrust legislation). In the United States, the power to define crimes and set punishment for them rests with the legislatures of the United States, the several states, and the territories, the principal authority being that of the individual states. This power in the states is restricted by the Federal constitution, e.g., in the Fourteenth Amendment and in prohibitions against acts of attainder (an act of attainder is a legislative declaration that a particular individual is guilty of a crime) and against ex post facto laws (laws declaring certain actions to be criminal with retroactive effect). State constitutions may also limit state legislative action. The courts cannot look further into the propriety of a penal statute than to ascertain whether the legislature has the power to enact it. Administrative rules may have the force of law, and violations of such rules are punishable as public offenses, provided that the legislature has made such violations misdemeanors. A common law crime is one punishable under common law, as distinguished from crimes specified by statute. In many U.S. jurisdictions, including some in which comprehensive criminal statutes have been enacted, the common law in relation to crimes and criminal procedure has been recognized by the courts as in force, except insofar as it has been abrogated or repealed, expressly or impliedly, by statute. Thus the state may prosecute crimes that were indictable at common law even though they may not be denominated as such or be provided for by statute. In many other jurisdictions the courts have held the common law as to crimes as being abolished, and no act is punishable as a crime unless it is made so by statute, or unless the act is made punishable as a crime by the constitution, criminal procedure is entirely regulated by statute. There are no common law offenses against the United States, and one may be subject to punishment for crime in a Federal court only for the commission or omission of an act defined by statute or regulation having legislative authority, and then only if punishment is authorized by Congress. In general, crimes must be defined in a penal statute with appropriate certainty and definiteness, the constitutional requirement of due process of law is violated by a criminal statute that fails to give a person of ordinary intelligence fair notice that his contemplated conduct is forbidden by the statute. Except as otherwise provided by statute, to constitute a crime an overt act (actus reus) must be accompanied by a criminal intent (mens rea) or by such negligence as is regarded by law as equivalent to a criminal intent. Motive, or that which leads or

tempts the mind to indulge in a criminal act, as distinguished from intent, is neither a crime nor an essential element of a crime. The motive with which an offense was committed is immaterial. Proof of motive may be material in proving that the defendant committed a particular crime, but it is not essential to a conviction. Every accused has the right to avail himself of any and all defenses the law recognizes and permits—e.g., insanity, mistake of fact, or self-defense. An accused having the right to resort to several defenses may make an election as to the one on which he will rely. The fact that one undertakes a crime on the advice, or as the agent, of another is not a defense, on the other hand, except in the case of HOMICIDE, an act that would otherwise constitute a crime may be excused when committed under duress or compulsion that is present, imminent, and impending, and that produces a well-grounded apprehension of death or serious bodily harm if the act is not done (see COERCION). Religious belief is not ordinarily a justification or excuse for the commission of a crime (see BIGAMY). The procedure in criminal cases is substantially the same throughout the United States. The person suspected of crime is taken into custody by a police officer, usually by service of a WARRANT of arrest. The case is first presented to a grand jury, which draws up an INDICTMENT if there is sufficient evidence to justify trial, otherwise it discharges the accused. While action is pending, the party charged may be released on BAIL. Trial is by jury or before a judge alone. The government presents its case (i.e., attempts to prove the allegations of the indictment), through the public prosecutor, usually called the district attorney, while the accused is represented by counsel chosen by himself or appointed by the court. The legal presumption of innocence puts the burden of proving guilt beyond a reasonable doubt on the prosecution, unless, of course, the defendant pleads guilty to the charge. Special rules restricting the introduction of EVIDENCE in criminal trials further protect the defendant. If the accused is adjudged innocent, he is discharged, if he is found guilty, the judge pronounces sentence upon him. (For types of criminal penalties, see CAPITAL PUNISHMENT, CORPORAL PUNISHMENT, PRISON.) If the defendant is convicted, he may file for an APPEAL, if he is acquitted, however, the prosecution cannot appeal the verdict. Generally speaking, this procedure is confined to felonies, misdemeanors, being relatively less serious offenses, are handled in a more summary fashion. It is generally accepted that no court will enforce the criminal law of another jurisdiction, but by means of EXTRADITION a fugitive from justice may be delivered to the competent authorities. For an account of criminal law in ancient and medieval times, see COMPOSITION, VENDETTA. See also MILITARY LAW, MARTIAL LAW, INTERNATIONAL LAW, PIRACY, WAR CRIMES. See Glanville Williams, *Criminal Law* (2d ed., 1961), W. J. Chambliss, ed., *Crime and the Legal Process* (1969), S. H. Kadish, *Criminal Law and Its Processes* (1969).

criminology, the study of crime, its causes, its correction, and its prevention. Although it is generally considered a subdivision of SOCIOLOGY, it also draws on the findings of psychology, economics, and other disciplines that investigate humans and their environment. Most criminologists regard crime as a violation of social rules that have been codified into laws (see CRIMINAL LAW). Since cultures vary in organization and values, what is considered criminal may also vary, although most societies, preliterate or otherwise, have restrictive laws or customs. Crimes against property, long a major concern of Western criminology, acquired new definitions in Communist countries, where private property is limited to consumer goods. In examining the evolution and definition of crime, criminology aims to remove from this category acts that no longer conflict with society's norms and acts that violate the norms without imperiling society. Criminology as a study also embraces environmental, hereditary, or psychological causes, modes of investigation and conviction, and the efficacy of punishment (see PRISON). Determination of the prevalence of crime is difficult because of varying definitions and the fact that much crime is unreported. In the last few decades recorded crime in Western countries has risen. Offenses against property (burglary and theft) have risen in the United States and in other urbanized countries, as have crimes of violence (murder, rape, aggravated assault). Crime rates tend to fluctuate with social trends, rising in times of depression, after wars, and in other periods of disorganization. In the United States ORGANIZED CRIME first became significant during prohibition. Within cities, poverty areas have the highest rates of reported crime, espe-

cially among young people (see JUVENILE DELINQUENCY). The high incidence of recidivism (repeated criminality) has led criminologists to suggest the need for more effective penal systems and better analyses of causation. The causes of crime are complex. The idea that criminals can be detected by their physical structure (shape of head, ear lobes, and the like) has been largely discredited. Hereditary physical and psychological traits are generally ruled out as independent causes of crime, but psychological states are believed to determine an individual's reaction to potent environmental influences. Some criminologists assert that certain offenders are born into environments (such as extreme poverty or minority groups in areas where they are discriminated against) that tend to generate criminal behavior. Others argue that since only some persons succumb to these influences, there are additional stimuli. Perhaps the most widely accepted theory in criminology is Edwin Sutherland's theory of differential association, which argues that criminal behavior is learned in small groups. Psychiatry generally considers crime to result from emotional disorders, usually stemming from maladjustment in childhood. The criminal symbolically enacts a repressed wish, or desire, and such crimes as pyromania or kleptomania are specific expressions of personality disorders. Therefore, psychiatrists hold, crime prevention and the cure of offenders are matters of treatment rather than coercion. Criminologists are nearly unanimous in advocating that acts involving narcotics, alcohol, and sexual preferences (known among criminologists as crimes without victims) be removed from the category of crime. In dealing with crime in general the emphasis has gradually shifted from punishment to rehabilitation. Criminologists have worked to increase the use of probation and parole, psychiatric treatment, education in prison, and betterment of living conditions. One major area of crime that was relatively ignored until recent decades is that of white-collar crime, i.e., crimes committed by people of relatively high social status in the regular course of their professional or business careers. The President's Commission on Law Enforcement and Administration of Justice in 1967 concluded that about three times as much property is stolen by white-collar criminals as by other criminals outside of organized crime. See Sheldon Glueck and Eleanor Glueck, *Criminal Careers in Retrospect* (1943, repr. 1966), Hermann Mannheim, ed., *Pioneers in Criminology* (2d ed. 1960, repr. 1972) and *Comparative Criminology* (2 vol., 1965), Don Gibbons, *Society, Crime, and Criminal Careers* (1968), Jürgen Thorwald, *Crime and Science* (1968), Roger Hood, *Key Issues in Criminology* (1970), Edwin Sutherland and Donald Cressey, *Criminology* (8th ed. 1970), Richard Quinney, *The Social Reality of Crime* (1971), Stephen Schafer and William Knudten, *Reader in Criminology* (1973).

Crinoidea* see ECHINODERMATA, SEA LILY

Cripple Creek, city (1970 pop. 425), alt. 9,375 ft (2,858 m), seat of Teller co., central Colo., inc. 1892. Now a summer resort, it was once a great gold-mining town. The discovery of gold (1891) on a cattle ranch created one of the richest camps of a major gold-producing area, with a rough and exciting town life. In 1901 the district had an estimated population of 50,000. Although gold production declined after that year, the opening of a drainage tunnel in 1941 reactivated formerly flooded mines and led to the discovery of new veins. Violence marked miners' strikes there in 1893 and 1904. Today the old mines are tourist attractions.

Cripps, Sir Stafford, 1889–1952, British statesman. A brilliant and successful patent and corporation lawyer, he joined the Labour party in 1929 and became solicitor general in 1930, being knighted the same year. He resigned on the formation (1931) of the National government but won a seat in Parliament. He became a leading spokesman of the left wing of the Labour party and in 1939 was expelled from the party for urging a united front with the Communists. Sir Winston Churchill appointed (1940) him ambassador to the Soviet Union and on Cripps's return to England in 1942 made him lord privy seal and leader of the House of Commons. In the same year Cripps was sent to India with a self-government plan (which was rejected by India). Shortly thereafter he became minister of aircraft production. In 1945, Cripps was readmitted to the Labour party and appointed president of the Board of Trade in the new Labour government. He returned to India to negotiate independence in 1946, and the failure of his mission (because of the antagonism between Hindus and Muslims) is often seen as the point at

which the partition of India became inevitable. In 1947, Cripps was appointed to the newly created office of minister of economic affairs and within the same year became, in addition, chancellor of the exchequer. Great Britain was in the throes of a severe economic crisis, which Cripps sought to counter with his policy of austerity. By continuing rationing and imposing strict economic controls, he was able to slow inflation while maintaining full employment and without cutting back the government's welfare programs. Despite a vigorous export drive, however, Britain's balance of payments situation remained serious, and in 1949, Cripps most reluctantly devalued the pound by 30%. He retired in 1950. See biography by Colin Cooke (1957).

Cris: see KÖRÖS, river, Rumania

Crișana-Maramureș (krīshā'na-maramōō'rīsh), historic province, NW Rumania, between Transylvania and Hungary. It covers approximately the present-day regions of Crișana (4,725 sq mi/12,238 sq km) and of Maramureș (4,053 sq mi/10,497 sq km). ARAD, ORADEA, and SATU-MARE are the chief cities. The region occupies the easternmost part of the Hungarian plain and the western foothills of the Transylvanian Alps. It is largely agricultural. Crișana-Maramureș was part of Hungary until 1919 and retains a sizable Hungarian minority.

crisis, economic* see DEPRESSION

Crispi, Francesco (franchās'kō krēs'pē), 1819–1901, Italian premier (1887–91, 1893–96), b. Sicily. After participation in the Sicilian revolt of 1848 against the repressive rule of Ferdinand II of Sicily, he went into exile to Piedmont, then to Malta and England, where he met Mazzini, and to France. He returned to Italy and joined GARIBOLDI in his expedition to Sicily, which resulted in the proclamation of the kingdom of Italy (1861). A deputy to the Italian parliament from 1861, he was at first a republican, but later became an outspoken monarchist. He was minister of the interior (1877–78) and later premier. Through his personal relations with Bismarck, friendship with Germany was furthered, while Italian relations with France deteriorated. He was much interested in colonial policies, Eritrea in NE Africa was organized under him. Crispi was again premier, when the victory of the Ethiopians over the Italians at Adowa forced him from office.

Crispus, prominent Corinthian Jew converted by St. Paul. Acts 18, 1 Cor 1, 14.

Cristóbal (krēstō'bal), town (1970 pop. 388), Panama Canal Zone, near the Caribbean end of the canal. Cristóbal is the American residential suburb of Colón.

Cristus, Petrus* see CHRISTUS, PETRUS

Critias (krīsh'ēas, krītēās), c. 460–403 B.C., Athenian political leader and writer. A relative of Plato, he was an aristocrat and had early training in philosophy with Socrates and wrote poems and tragedies. He is best remembered, however, as one of the Thirty Tyrants imposed on Athens by the Spartans. He was soon at odds with Tharmenes, who was put to death. Critias earned a name for rapacity and bloodthirstiness, although Plato seems to have admired him, using him as a speaker in the dialogues *Protagoras*, *Timaeus*, and *Critias*. When THRASYBULUS led his forces against the Thirty, Critias was killed in battle.

criticism, the interpretation and evaluation of literature and the arts. It exists in a variety of literary forms: dialogues (Plato, John Dryden), verse (Horace, Alexander Pope), letters (John Keats), essays (Matthew Arnold, W. H. Auden), and treatises (Philip Sydney, Percy Bysshe Shelley). There are several categories of criticism: theoretical, practical, textual, judicial, biographical, and impressionistic. One of the most laborious and exacting kinds is textual criticism, which is the comparison of different texts and versions of particular works with the aim of arriving at an incorrupt "master version." This has been perhaps most familiar over the centuries in biblical criticism. Textual critics of note include St. Augustine and St. Jerome (the Bible), Samuel Johnson and H. H. Furness (Shakespeare), and F. J. Furnival (early English texts). From its beginning criticism has concerned philosophers. Plato raised the question of the authenticity of poetic knowledge in the *Ion*, in which both poet and performer are forced to admit ignorance about the source of their inspiration or the function of their craft. In his *Poetics*, Aristotle focused on tragic drama to discover its effect—the purgation of the audience's emotions (see TRAGEDY). Roman civilization produced two critics

who were poets rather than philosophers. Horace declared in the *Ars Poetica* (c. 13 B.C.) that poetry must be "dulce et utile"—"sweet and useful." In his *On the Sublime* (1st cent. A.D.) the Greek Longinus presented the view that poetry must be the divinely inspired utterance of the poet's impassioned soul. Interestingly, each of these pronouncements was an accurate description of the author's own work rather than a set of rules for all poetry. Thus, the ancients can be credited with delineating the two major types of criticism: theoretical, which attempts to state general principles about the value of art (Plato, Aristotle), and practical, which examines the particular works, genres, or writers in light of theoretical criteria (Horace, Longinus). Renaissance critics ignored their recent heritage—the medieval attitude toward art as a form of prayer—and looked to the classics, Aristotle's works in particular, for usable models. Philip Sidney maintained in his *Defense of Poetry* (1595) that poetry must engage and uplift the emotions of its audience with "heart ravishing knowledge." In his *Poetics* (1561) the Italian critic Julius Caesar Scaliger transformed Aristotle's description of the dramatic unities of time, setting, and plot into exigencies, strictly adhered to by the neoclassical dramatists of 17th-century France and England. John Dryden, the master critic of Restoration England, upheld neoclassical standards, adding his own emphases. In his *Essay of Dramatic Poesy* (1668) he justified the use of rhyme in tragedy by arguing that drama was the work of a poet, not a transcription of random conversation. In his *Essay on Criticism* (1711) Alexander Pope added an important section on the criticism of critics: those who do their job best always "survey the Whole, not seek slight faults to find." Because the general tone of criticism of this period was prescriptive, it is called judicial criticism. Samuel Johnson's *Lives of the Poets* (1779–81) was the first thorough-going exercise in biographical criticism, the attempt to relate a writer's background and life to his works. The revolution from neoclassicism to romanticism was first outlined by William Wordsworth and Samuel Taylor Coleridge, who emphasized the importance of emotion and imagination in literature. In his Preface to the Second Edition of the *Lyrical Ballads* (1800), Wordsworth described the lyric as "emotion recollected in tranquility," whereas Coleridge, in his *Biographia Literaria* (1817) defined imagination as "the repetition in the finite mind of the eternal act of creation," rather than as a mere mechanical flight of fancy. The radical shift in emphasis was further delineated by John Keats in his letters and by Percy Bysshe Shelley in his *Defense of Poetry* (1821)—"poets are the unacknowledged legislators of the world." Diverse trends marked the criticism of the mid-19th century. The didacticism of Matthew Arnold, who held that the aims of literature should be "high seriousness" and a "criticism of life," was countered by Edgar Allan Poe in *The Poetic Principle* (1850), by Walter Pater in *Studies in the History of the Renaissance* (1873), and by Arthur Symonds in *The Symbolist Movement in Literature* (1899). These critics celebrated art for art's sake, with no moral strings attached. Henry James, an important novelist and critic of the novel, stressed the possibilities of point of view for further developing the narrative form in his essay "The Art of Fiction" (1893). The emphasis in criticism of this period on the reaction of the critic to the work under scrutiny led to the use of the term impressionistic criticism. However, as the American critic M. H. Abrams has pointed out in *The Mirror and the Lamp* (1953), all criticism, no matter what its form, type, or provenance, emphasizes one of four relationships: the mimetic, the work's connection to reality, the pragmatic, its effect on the audience, the expressive, its connection to the author, and the objective, the work as an independent, self-sufficient creation. The 20th cent. has been called the Age of Criticism. Such major disciplines as psychology and anthropology, and such ideologies as Christian theology and Marxist dialectic, were found to have valid application to works of literature. Freudian analysis became a tool for literary biographers. Carl Jung's theory of the collective unconscious also became a tool, along with anthropological methodology, for critics like T. S. Eliot (in *The Sacred Wood*, 1920) and Northrop Frye (in *Anatomy of Criticism*, 1957), who sought to trace similarities of pattern in literatures of disparate cultures and ages. I. A. Richards used techniques of psychological measurement to examine reader response with new precision, notably in *Practical Criticism* (1929). By means of the so-called New Criticism—the technique of close reading—such

critics as Cleanth Brooks, Allen Tate, Lionel Trilling, John Crowe Ransom, and Robert Penn Warren revived the notion of a poem as an autonomous art object. Notable among academic and journalistic critics who used a combination of critical approaches to enlighten their readers are Edmund Wilson (in such works as *The Triple Thinkers*, 1938), W. H. Auden (in *The Dyer's Hand*, 1962), and George Steiner (in *Language and Silence*, 1970). There have been a variety of critical trends in music and art criticism also. The approach has ranged from practical to theoretical, from G. B. Shaw's music reviews in the London press of the 1880s to treatises like Alfred Einstein's *Mozart* (1945) and Charles Rosen's *Classical Style* (1971). And the spectrum of art criticism includes such works as Robin George Collingwood's *Principles of Art* (1938), André Malraux's *Voices of Silence* (1952), and John Canaday's weekly reviews of museum and gallery exhibits. With the decline of representational art and the rise of cubism, abstract expressionism, and minimal art, art critics seem to have proliferated, with critics like Clement Greenberg, Barbara Rose, and Hilton Kramer among the most influential. Newer areas for critical scrutiny include film, architecture, and urban planning. Notable film critics include James Agee, André Bazin, and Pauline Kael. Ada Louise Huxtable's architecture criticism and Louis Mumford's studies of the city have broken new ground for critical scrutiny. See George Saintsbury, *A History of Criticism* (3 vol., 1961), F. C. Crews, *The Pooh Perplex* (1963), René Wellek, *A History of Modern Criticism* (4 vol., 1955-65), W. C. Greene, *The Choices of Criticism* (1965).

Critius (krīsh'ās), or **Kritios** (krīt'ēōs), and **Nesiotos** (nēshēō'tēz), fl. 5th cent. B.C., Greek sculptors, in the time of the Persian Wars. They made statues of the Tyrannicides, Harmodius and Aristogiton, who slew the tyrant Hipparchus. The works replaced a group by Antenor taken from Athens by Xerxes and later returned. The originals have disappeared, but a number of Roman reproductions survive. The most complete marble copies are those in the national museum at Naples. Critius, probably a pupil of Antenor, established a school of sculpture at Athens.

Crittenden, George Bibb, 1812-80, Confederate general, b. Russellville, Ky., son of John J. Crittenden and brother of Thomas L. Crittenden. Upon the outbreak of the Civil War, he left the U.S. army to become a Confederate brigadier general. At MILL SPRINGS (Jan., 1862) he was badly defeated and resigned, but he reenlisted and served without rank for the rest of the war.

Crittenden, John Jordan, 1787-1863, U.S. public official, b. Woodford co., Ky. A Kentucky legislator (1811-17), Crittenden entered the U.S. Senate (1817-19) but resigned to resume state offices. He served as Attorney General under Presidents William H. Harrison and John Tyler (March to Sept., 1841) and Millard Fillmore (1850-53). He replaced Henry Clay when Clay resigned from his Senate seat (1842) and was reelected the next year. During his last term in the Senate (1855-61), Crittenden was foremost in attempting to conciliate North and South (see CRITTENDEN COMPROMISE) and was chairman of the Border States Convention (May, 1863). See study by A. D. Kirwan (1962).

Crittenden, Thomas Leonidas, 1819-93, Union general in the Civil War, b. Russellville, Ky., son of John J. Crittenden and brother of George B. Crittenden. He served in the Mexican War and was (1849-53) U.S. consul at Liverpool. A major general in the Kentucky militia when the Civil War began, Crittenden became a Union brigadier general (Sept., 1861) and was promoted to major general (July, 1862) for his service at Shiloh. He commanded under Rosecrans at Murfreesboro and in the Chattanooga campaign. After being exonerated for the rout of his corps at Chickamauga, he served for a time in the Army of the Potomac. Crittenden resigned his commission in Dec., 1864, but reentered the army in 1867 and served until 1881.

Crittenden, Thomas Theodore, 1832-1909, governor of Missouri (1881-85), b. Shelby co., Ky., nephew of John J. Crittenden. In the Civil War he served (1862-65) as lieutenant colonel of a Missouri cavalry regiment in the fighting in Missouri and Arkansas. He was state attorney general in Missouri for a brief period after the war and served in the U.S. House of Representatives (1873-75, 1877-79). As governor, Crittenden brought an end to outlaw activity in the state, especially by breaking up the Jesse James gang. In President Cleveland's second term (1893-97) he was consul general in Mexico City. See

The Crittenden Memoirs (comp. by H. H. Crittenden, 1936).

Crittenden Compromise, in U.S. history, unsuccessful last-minute effort to avert the Civil War. It was proposed in Congress as a constitutional amendment in Dec., 1860, by Sen. John J. Crittenden of Kentucky with support from the National Union party. Basically, it accepted the boundary between free and slave states that had been set by the MISSOURI COMPROMISE (1820-21), extended the line to California, and assured the continuation of slavery where it already existed. In addition, it advocated slavery in the District of Columbia, upheld the FUGITIVE SLAVE LAW (1850) with minor modifications, and called for vigorous suppression of the African slave trade. At a peace conference called by the Virginia legislature in 1861, the compromise gained support from four border state delegations. Nevertheless, it failed in the House of Representatives in Jan., 1861, by a vote of 113 to 80 and in the Senate in March by a vote of 20 to 19. Its defeat made clear the inevitability of the Civil War. See A. D. Kirwan, *John J. Crittenden: The National Union Party Struggle for the Union* (1962).

Crivelli, Carlo (krēv'ēl'ā), b. c. 1430, d. after 1493, Venetian painter, who worked chiefly in the Marches. His paintings, notable for their rather harsh conception, include the *Virgin and Child* in the Ascoli Cathedral, a large altarpiece (National Gall., London), and *Coronation of the Virgin* (Brera, Milan). His work reveals a crystalline, linear technique and a fondness for elegant decorative motifs. Works in the United States include three entitled *Pieta* (Mus. of Fine Arts, Boston; Fogg Mus., Cambridge; Detroit Inst. of Arts), several of the *Madonna* (Walters Art Gall., Baltimore; National Gall. of Art, Washington, D.C.; Metropolitan Mus.), and *St. George on Horseback* (Gardner Mus., Boston).

Crna Gora: see MONTENEGRO, Yugoslavia.

Croaghpatrick (krō'āpāt'rīk, krō'āk'h-), mountain, 2,510 ft (765 m) high, Co. Mayo, W. Republic of Ireland, near Clew Bay. Legend connects it with St. Patrick, and its summit has long been a place of pilgrimage.

croaker, member of the abundant and varied family Sciaenidae, carnivorous, spiny-finned fishes including the weakfishes, the drums, and the whiting. The croaker has a compressed, elongated body similar to that of the bass. The name describes the croaking or grunting sounds produced by members of most species, chiefly during the breeding season. Croakers are found in sandy shallows of all temperate and warm seas. They range in weight from the 1-lb (0.5-kg) Atlantic croaker to the 150-lb (68-kg) common drum. The Atlantic croaker, common from Cape Cod to Texas, is an important food fish. The spot-fin croaker is found in the Pacific. The drums, the largest and noisiest croakers, include the red drum, or channel bass, of which over 2 million lb (900,000 kg) are taken per year off Florida, the common, or black, drum, found from New England to the Rio Grande, and the freshwater drum, found in central North America. The whittings, or kingfishes, include the Northern, or king, whiting, or sea mink, the Southern kingfish, or king whiting, and the surf whiting and its Pacific counterpart, the corbina. All average 3 lb (1.4 kg) in weight and 2 ft (60 cm) in length. Croakers are bottom feeders, those mentioned above have sensitive chin barbels to aid in locating their prey. The weakfishes, named for their easily torn flesh, lack barbels, they are also called sea trout. The common weakfish, or squeteague, abundant along the Atlantic coast, grows to 12 lb (5.5 kg) in weight and 3 ft (90 cm) in length. The more southerly spotted weakfish is similar. The white sea bass, weighing up to 60 lb (27 kg), is a Pacific croaker found as far north as Puget Sound. The spot, a small croaker, is commercially important in Virginia and the Carolinas, where the annual catch is estimated at 10 million lb (4.5 million kg) or more. Croakers are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Sciaenidae.

Croatia (krōā'shā), Croatian *Hrvatska* (hārvāt'skā), constituent republic of Yugoslavia (1971 pop. 4,422,564; 21,824 sq mi [56,524 sq km]), NW Yugoslavia. ZAGREB is the capital. The second largest Yugoslav republic, it includes Croatia proper, SLAVONIA, DALMATIA, and most of ISTRIA. There are important seaports at RIJEKA (Fiume), OSIJEK, SPLIT, PULA, ZADAR, ŠIBENIK, and DUBROVNIK. Western Croatia lies in the Dinaric Alps, the eastern part, drained by the Sava and Drava rivers, is mostly low lying and agricultural. The Pannonian plain is the chief farming region. More than one third of Croatia is forested, and

lumber is a major export. The region is the leading coal producer of Yugoslavia, and also has deposits of bauxite, copper, petroleum, and iron ore. The republic is the most industrialized and prosperous area of Yugoslavia. Tourism, especially along the Adriatic coast, is important to the economy. The Croats are Roman Catholic and use the Latin alphabet, there are also Serbs, Slovenes, and other minorities in Croatia. A part of the Roman province of Pannonia, Croatia was settled in the 7th cent. by Croats, who accepted Christianity in the 9th cent. A kingdom from the 10th cent., Croatia conquered surrounding districts, including Dalmatia, which was chronically contested with Venice. Croatia's power reached its peak in the 11th cent., but internecine strife facilitated its conquest in 1091 by King LADISLAUS I of Hungary. In 1102 a pact between his successor and the Croatian tribal chiefs established a personal union of Croatia and Hungary under the Hungarian monarch. Although Croatia remained linked with Hungary for eight centuries, the Croats were sometimes able to choose their rulers independently of Budapest. In personal union with Hungary, Croatia retained its own diet and was governed by a ban, or viceroy. After the battle of MOHÁCS in 1526 most of Croatia came under Turkish rule. In 1527 the Croatian feudal lords agreed to accept the Hapsburgs as their kings in return for common defense and retention of their privileges. During the following century Croatia served as a Hapsburg outpost in the defense of central Europe from a Turkish onslaught. The centralizing and Germanizing tendencies of the Hapsburgs, however, severely weakened the power of the Croatian nobility and awakened a national consciousness. During the 19th cent. Hungary imposed Magyarization on Croatia and promulgated (1848) laws that seriously jeopardized Croatian autonomy within the Hapsburg empire. Joseph JELLACHICH, ban of Croatia, had the diet pass its own revolutionary laws, including the abolition of serfdom. Jellachich's forces also marched against the Hungarian revolutionaries in the 1848-49 uprisings in the Hapsburg empire. When the dual Austro-Hungarian monarchy was established in 1867, Croatia proper and Slavonia were included in the kingdom of Hungary, and Dalmatia and Istria in the Austrian empire. The following year Croatia, united with Slavonia, became an autonomous Hungarian crownland governed by a ban responsible to the Croatian diet. Despite the achievement of autonomy in local affairs, Croatia remained restless because of continuing Magyarization. Cultural and political Croat and South Slav organizations arose, notably the Croatian Peasant party, founded in the early 20th cent. With the collapse of Austria-Hungary (1918), the kingdom of Serbs, Croats, and Slovenes (see YUGOSLAVIA) was formed. Serbs dominated the new state, however, and promoted centralization, ignoring Croat desires for a federal structure. Agitation resulted in the assassination (1928) of Stefan RADICH, head of the Croatian Peasant party. After Radich's successor, Vladimir MAČEK, connived with fascist Italy to form a separate Croatian state, Yugoslavia allowed the formation (1939) of an autonomous *banovina* comprising Croatia, Dalmatia, and parts of Bosnia and Herzegovina. Nevertheless, many Croats, especially members of the Ustachi fascist terrorist organization, insisted on complete independence. When the Germans invaded Yugoslavia in 1941, the Ustachi seized power and declared Croatian independence under Ante Pavelić. Croatia was placed under Italian and later German military control, while the Ustachi dictatorship perpetuated brutal excesses, including the massacre of thousands of Serbs. A large part of the population joined the anti-fascist Yugoslav partisan forces under TITO, himself a native of Croatia. Pavelić fled in the wake of Germany's defeat in 1945, and Croatia became one of the six republics of reconstituted Yugoslavia. Croatian nationalism persisted in Communist Yugoslavia, however. The Ustachi and other émigré nationalist groups remained active abroad, in 1972 a small band of invaders waged a gun battle with Yugoslav border security forces. Meanwhile, the Yugoslav government hoped that a major decentralization reform that took effect in the early 1970s would satisfy Croat demands for increased republican autonomy and thus dampen secessionist sentiment. See Stephen Gazi, *A History of Croatia* (1973).

Croatoan, unexplained letters found (1590) carved on a tree on ROANOKE ISLAND off North Carolina by Governor John White when he returned to the colony from England and discovered the colonists gone. White took the letters to mean that the settlers had moved to Croatoan Island some 50 mi (80 km)

away, but no trace of them was ever found. The name, in the form Croatan, is popular in the region and is perhaps best known in the name of Croatan Sound, which connects Pamlico Sound with Albemarle Sound.

Croce, Benedetto (bānādēr'tō krō'chā), 1866–1952, Italian philosopher, historian, and critic. He lived mostly in Naples, devoting himself to studying and writing. He founded and edited (1903–44) *Critica*, a review of literature, history, and philosophy, which in 1944 became *Quaderni della critica*. Croce was made a senator in 1910 and was minister of education (1920–21). A staunch opposer of Fascism, he lived in retirement until 1943, when he became a leader of the Liberal party. Croce's system of philosophy is related to the idealistic school in that spirit, monistic in manifestation, constitutes the only reality. The general title of the work presenting his system is *Philosophy of the Spirit* (1902–17, tr. 1909–21), which is divided into four parts, *Aesthetic as Science of Expression and General Linguistic*, *Logic as the Science of Pure Concept*, *Philosophy of the Practical*, and *History: Its Theory and Practice*. Among his other works are *A History of Italy, 1871–1915* (1927, tr. 1929) and *History as the Story of Liberty* (1938, tr. 1941). See his essays, *My Philosophy* (tr. 1949), studies by A. A. De Gennaro (1961), G. N. G. Orsini (1961), and Bernard Bosanquet (1972).

crochet work (krōshā'), form of knitting done with a hook, by means of which loops of thread or yarn are drawn through other, preceding loops. Crochet stitches are all based on the chain or single crochet, i.e., a single loop. In double crochet the thread is thrown once about the hook before the loop is drawn. All other stitches and patterns are merely varying combinations of the single or double loop. The art finds its highest expression in Irish crochet, done with the finest thread and hooks in intricate patterns, usually displaying a motif of leaves or flowers set in an open weblike ground. Whole garments, as well as trimmings, hats, and bags are made by the skillful Irish needlewomen.

Crocker, Charles, 1822–88, American railroad builder, b. Troy, N.Y. In 1836 he moved with his family to Marshall co., Ind., where he later set up a small foundry. He joined a party to seek gold in California in 1849. He and a brother opened (1852) a store to sell supplies to miners, and as it prospered they started others, later consolidating them in Sacramento. There Crocker met Mark Hopkins, Hopkins's partner, Collis P. Huntington, and Leland Stanford, and with them he organized (1861) the Central Pacific Railroad Company of California. Crocker undertook responsibility for actual construction, completing it in 1869. His difficulty in maintaining an adequate labor force for the arduous work led to his employment of Chinese laborers, who were kept in a state of virtual slavery. In 1871, Crocker sold out his interest to his partners, but in the Panic of 1873 he returned as director and vice president. See Oscar Lewis, *The Big Four* (1938).

Crockett, Davy (David Crockett), 1786–1836, American frontiersman, b. Limestone, near Greeneville, Tenn. After serving (1813–14) under Andrew Jackson against the Creek Indians in the War of 1812, he settled in Giles co., Tenn., and in 1821 was elected to the state legislature. In 1823, Crockett, having moved to the extreme western part of the state, was reelected from his new constituency. When it was jokingly suggested that he should run for Congress, he took the proposal seriously and served three terms in the House (1827–31, 1833–35). His dress, language, racy backwoods humor, and naive yet shrewd comments on city life and national affairs made him a popular figure in Washington. Crockett became a political opponent of Jackson, and the Whigs took him up so assiduously that he became the showpiece of conservatism. Resenting his defeat for reelection in 1835, Crockett left Tennessee for Texas, where he heroically lost his life in the defense of the ALAMO. *A Narrative of the Life of David Crockett* (1834), *An Account of Col. Crockett's Tour to the North and down East* (1834), and *Col. Crockett's Exploits and Adventures in Texas* (posthumous, 1836) were supposedly written by Crockett himself in his own inimitable idiom, but they do not match, either in content or style, those letters which are definitely known to be his. See his *Narrative*, facsimile edition edited by J. A. Shackford and S. J. Folmsbee (1973), study by J. A. Shackford (1956).

crocodile, large, carnivorous REPTILE of the order Crocodylia, found in tropical and subtropical regions. Crocodiles live in swamps or on river banks and catch their prey in the water. They have flat-

tened bodies and tails, short legs, and powerful jaws. The eyes, ears, and nostrils are located near the top of the head and are exposed when the crocodile floats on the surface of the water. The ears and nostrils have valves that close when the animal is submerged. Most crocodiles are more aggressive than the related ALLIGATORS. The two forms are distinguished by the long lower fourth tooth in crocodiles, but not in alligators, this tooth protrudes on the side of the head when the mouth is closed. The snouts of most crocodiles are narrower than those of alligators. Small crocodiles feed on fish and small aquatic animals, larger ones also catch land mammals and birds that approach the water. Members of some large species sometimes attack and eat humans. The female crocodile deposits her eggs, usually about 20 in number, in a nest of rotting vegetation or in a shallow pit on the river bank, and digs them up when she hears them hatching. In most species the average adult length is between 6 and 10 ft (1.8–3 m). The largest crocodile (the saltwater crocodile) is often 14 ft (4.3 m) long and may exceed 20 ft (6 m) in length. The Nile, American, and Orinoco crocodiles are commonly 12 ft (3.7 m) long, and specimens up to 23 ft (7 m) long have been reported for the last two species. The smallest crocodile (the Congo dwarf crocodile) averages 3½ ft (1.05 m) long. With the exception of the two African dwarf crocodiles (*Osteolaemus*) and the so-called false gavia (*Tomistoma*) of Asia, crocodiles are classified in the genus *Crocodylus*, with about a dozen species. The Nile crocodile (*Crocodylus niloticus*) is found in fresh and salt water throughout S and central Africa. In early historic times it ranged N to the Nile delta and the Mediterranean coast. It sometimes attacks humans, as does the saltwater crocodile (*C. porosus*), found on islands and in straits from SE Asia to Australia and Melanesia. The marsh crocodile, or mugger (*C. palustris*), is a freshwater species of India and Ceylon, regarded as sacred in some regions. The American crocodile (*C. acutus*) is found in fresh and salt water in S Florida, the West Indies, Central America, and NW South America. It does not attack humans without provocation. The Orinoco crocodile (*C. intermedius*) is a freshwater species of the Orinoco basin of Colombia and Venezuela. Two smaller species are found in limited areas of Central America and Cuba. Crocodiles are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Crocodylia, family Crocodylidae. See also GAVIAL.

crocus see IRIS

Croesus (krē'sas), d. c. 547 B.C., king of Lydia (560–c. 546 B.C.), noted for his great wealth. He was the son of Alyattes. He continued his father's policy of conquering the Ionian cities of Asia Minor, but on the whole he was friendly to the Greeks, and he is supposed to have given refuge to the Athenian statesman Solon. Threatened by CYRUS the GREAT of Persia, Croesus allied himself with Amasis II of Egypt and Nabonidus of Babylonia against the Persian might, but the alliance was of no avail. Cyrus defeated and captured Croesus, and, according to Herodotus, Croesus cast himself upon a funeral pyre.

crofting see BLEACHING

Croghan, George (krō'gān), d. 1782, American Indian agent, b. Ireland. He migrated to North America in 1741 and became (1756) deputy superintendent of Indian affairs under Sir William Johnson. Croghan was to a large extent responsible for Johnson's success and reputation among the Indians. In the French and Indian War he caused many tribes to desert the French cause. See biographies by A. T. Volwiler (1926, repr. 1971) and N. B. Wainwright (1959).

Croghan, George, 1791–1849, American military officer, b. near Louisville, Ky., nephew of George Rogers Clark and William Clark. He won public acclaim and a congressional award for his defense of Fort Stephenson against almost overwhelming enemy forces in the War of 1812. Croghan later served under Zachary Taylor in the Mexican War. See *Army Life on the Western Frontier*, selections from Croghan's official reports ed. by F. P. Prucha (1958).

Croissy, Charles Colbert, marquis de (shārl kōlbēr mārķē dā krwāsē'), c. 1625–96, French diplomat, brother of Jean Baptiste Colbert. He entered the service of Cardinal Mazarin and filled many diplomatic posts in Europe in the 1650s and 60s. In 1668 he signed the peace treaty of Aix-la-Chapelle, which ended the War of Devolution. As ambassador to England (1668–74) he negotiated the first treaty of Dover with King Charles II (1670). In 1678 he became president for life of the Parlement of Paris. Becoming minister of state for foreign affairs in

1680, he worked to develop an alliance system for France and was probably instrumental in developing the "chambers of reunion" to aid Louis XIV's expansionist ambitions.

Croix, Carlos Francisco de Croix, marques de (kar'lōs franthēs'kō dā krawa' mārķās dā krawa'), 1699–1786, Spanish colonial administrator, b. Lille, France. As viceroy of New Spain (1766–71), he was a genial, honest, and industrious official, but the real ruler was Jose de GALVEZ, the Visitor-General. Many reforms were instituted, the Jesuits were expelled (1767), and the natives of NW Mexico were subdued in order to open the California frontier. His nephew, Teodoro de Croix, 1730–91, was military commander and provincial governor in Mexico before becoming viceroy of Peru (1784–90). He put into operation the reforms in Indian administration that resulted indirectly from the revolt of Tupac Amaru.

Croker, John Wilson (krō'kar), 1780–1857, British Tory politician and author, b. Ireland. He was a member of Parliament from 1807 to 1832 and secretary of the admiralty from 1810 to 1830. The most famous of his regular contributions as a critic to the *Quarterly Review* was his virulent attack (1818) on Keats's *Endymion*. Croker's best work was his careful edition (1831) of Boswell's *Life of Johnson*. See *Croker Papers* (ed. by L. J. Jennings, 3 vol., 1884, repr. 1972).

Croker, Richard, 1841–1922, American politician, head of TAMMANY HALL from 1886 to 1902, b. Co. Cork, Ireland. He became prominent as Democratic leader of New York City's East Side and as an aide of John KELLY. He was elected (1868) alderman and held minor appointive offices, which increased in importance after Kelly succeeded (1871) William M. Tweed as boss. Croker became Kelly's chief lieutenant, and after Kelly's death (1886) Croker was the acknowledged Tammany boss. Croker was (1889–90) city chamberlain and brought about the elections of Hugh Grant (1888), Thomas F. Gilroy (1892), and Robert Van Wyck (1897) as mayors. The election (1901) of Seth Low as mayor of New York caused Croker's abdication as Tammany leader, and he was succeeded by Charles F. MURPHY. Croker spent the remainder of his life in leisure in England and Ireland. See T. L. Stoddard, *Master of Manhattan* (1931).

Croker, Thomas Crofton, 1798–1854, Irish antiquary, b. Cork. One of the first to collect Irish folklore, he compiled *Fairy Legends and Traditions of the South of Ireland* (1825–28), *Legends of the Lakes* (1829), and *Popular Songs of Ireland* (1837).

Croly, Jane Cunningham, pseud. Jennie June, 1829–1901, American journalist and feminist, b. England. She came to the United States at the age of 12 and in 1857 married author and editor David Goodman Croly. She was one of the earliest American newspaperwomen, writing for various New York newspapers under the pseudonym Jennie June. From 1860 to 1887 she edited *Demorest's Quarterly Mirror of Fashion* (later *Demorest's Illustrated Monthly*) and later was part owner of *Godey's Lady's Book*. She specialized in women's features and was among the first journalists who syndicated their articles. In 1856 she called the first women's congress. Twelve years later, in 1868, she founded Sorosis, the only women's club of importance at that time, and in 1889, the New York Women's Press Club. She wrote *The History of the Woman's Club Movement in America* (1898).

Cro-Magnon man (krō'-māg'nōn), human being that lived about 35,000 years ago. Skeletal remains, associated with artifacts of the Aurignacian culture, were first found (1868) in the rock shelter of Cro-Magnon in Les Eyzies, Dordogne, France. Later finds, differing slightly from each other in skeletal characteristics, were made in a number of caverns in the Dordogne valley, Solutre, and in Spain, Germany, Czechoslovakia, and Poland. Cro-Magnon man is of the same species as modern man (*Homo sapiens*). Unlike NEANDERTHAL MAN, whom he superseded, Cro-Magnon stood straight and was 6 ft (180 cm) or more tall. The head was balanced as in modern man, the forehead was high, the brain large, and the chin well developed. Skillfully made flint and bone tools, shell and ivory jewelry, and polychrome paintings found on the walls of some caves in S. France and N. Spain indicate an advanced culture. See MAN, PREHISTORIC.

Cromarty, county, Scotland. See ROSS AND CROMARTY.

Cromarty Firth, deep narrow inlet of Moray Firth, c. 15 mi (25 km) long, in Ross and Cromarty co., N. Scotland. It provides excellent anchorage, its narrow

entrance being protected by the headlands of the Sutor rocks, more than 400 ft (122 m) high

Cromberger, Juan: see PABLOS, JUAN

Crome, John, 1768–1821, English landscape painter, b Norwich. Crome was the principal painter of the Norwich school. He is often called Old Crome to distinguish him from his son who painted in the same manner but with less mastery. He was born into poverty but rose to the position of a provincial landscape painter, earning his living by giving drawing lessons and selling an occasional picture. Crome's work was influenced by Gainsborough and by the Dutch masters. His landscapes are notable for simplicity and serenity. Beautiful examples are to be seen in many British galleries and private collections. *Mousehold Heath* and *Poringland Oak* are in the National Gallery, London. The Metropolitan Museum has *The Old Oak* and *Hautbois Common*. Crome's etchings were published after his death under the title *Norfolk Picturesque*. See studies by R. H. Motttram (1931) and D. and T. Clifford (1968).

Cromer, Evelyn Baring, 1st earl of (ēv'lin bār'ing krō'mar), 1841–1917, British administrator in Egypt. Appointed (1877) first British commissioner of the Egyptian public debt office, he directed investigations by France and England into the bankrupt administration of ISMAIL PASHA. After the deposition of Ismail and accession of TEWFIK PASHA, Baring became (1879) British controller general in Egypt. He was (1880–83) finance minister in India and returned to Egypt after Arabi Pasha's nationalist revolt to become British agent and consul general in 1883. Until his resignation in 1907, Baring (created Baron Cromer in 1892 and earl in 1901) was the virtual ruler of Egypt. Faced with the Mahdist rebellion in Sudan, he recommended Egyptian withdrawal and only reluctantly agreed to the appointment of Charles George GORDON to arrange the evacuation. He reformed Egyptian finances, administration, and education, improved the railroads, and developed methods of agriculture and irrigation. After the reconquest (1896–98) of the Sudan, he devised the Anglo-Egyptian system of government. Cromer was a Greek scholar and wrote books on imperial and Egyptian affairs. See biography by L. J. L. Zetland (1932), study by John Marlowe (1970).

cromlech (krōm'lēk) [Welsh or Breton, =crooked stone], term that has changed in meaning from its original equivalent to DOLMEN. It later came to be used for a single standing stone and now usually refers to a circle of such stones, as at STONEHENGE.

Crommelync, Fernand (fērnān' krōmalānk'), 1888?–, Belgian dramatist, b Brussels. Crommelync earned his living as an actor before the great success of his tragic farce about jealousy *Le Cocu magnifique* (1921, tr. 1966). Other plays that reveal his expert craftsmanship and strong lyric power include *Le Sculpteur de masques* (1908), *Le Marchand de regrets* (1913), and *Carne* (1930). See the translation of two plays by Marnit Gijzen (1966).

Crompton, Samuel, 1753–1827, English inventor of the mule spinner, or muslin wheel, an important step in the development of fine cotton spinning. Working as a young man in a spinning mill, he knew the defects of the Hargreaves jenny and determined to produce something better. After five years of secret work, he perfected (1779) a machine that combined the features of the jenny and Arkwright's frame and that, in one operation, by drawing, twisting, and winding the cotton, produced a very fine yarn. Crompton, however, was too poor to obtain a patent for his invention and sold his rights for £60. Later Parliament granted him £5,000.

Cromwell, Oliver, 1599–1658, lord protector of England. The son of a gentry family, he entered Cambridge in 1616 but probably left the next year. Cromwell entered Parliament in 1628, standing firmly with the opposition to CHARLES I, and was active in the Short and Long Parliaments (1640), although not a conspicuous leader. During the first civil war (see ENGLISH CIVIL WAR) he rose rapidly to leadership because of his military ability and his genius for organizing and inspiring the parliamentary armies. His own regiment, the Ironsides, distinguished itself at Marston Moor (1644) and in numerous minor engagements. In 1644 he pressed for a thorough reorganization of the parliamentary forces and was appointed (1645) second in command to Sir Thomas Fairfax (later Baron FAIRFAX OF CAMERON) in the resulting New Model Army, which defeated the king at Naseby in 1645. In the quarrel between the army and Parliament following the first civil war, Cromwell, himself an Independent, supported the sectarians in the army and approved the seizure (1647) of Charles from Parliament. However, he favored a

moderate settlement with the king (as opposed to the radical proposals of the LEVELERS) until Charles's flight to Carisbrooke (1647) and secret dealings with the Scots caused him to lose all hope of further negotiations with the king. In the second civil war he repelled the Scottish royalist invasion at Preston (1648). His political power was enhanced by the removal of Presbyterian leaders from Parliament in Pride's Purge (see under PRIDE, THOMAS), and at the king's trial (1649) his was the leading voice demanding execution. In 1649, after the proclamation of the republican Commonwealth, Cromwell led a punitive expedition into Ireland, remembered primarily for the massacre of the royalist garrison at Drogheda. He then initiated a policy of systematic dispossession of the Irish, transferring their lands to English landlords. In 1650 he invaded Scotland and routed the Scottish royalists at Dunbar; later he defeated the Scots and Charles II himself at Worcester (1651) and left the rest of the conquest of Scotland to Gen. George Monck. Cromwell, now virtual dictator of the Commonwealth, dissolved the Rump Parliament in 1653 after it had failed to effect reforms demanded by the army and had sought to perpetuate its power. His attempt to replace it by the Nominated (Barebone's) Parliament (see BAREBONE, PRAISE-GOD), appointed by himself from nominations of the Independent congregations, resulted in a reckless, hopelessly divided body that was finally forced to dissolve itself. A group of army officers then drew up the constitutional document known as the Instrument of Government (1653), by which Cromwell became lord protector (see PROTECTORATE). The Parliament of 1654, which was elected under the terms of the same document, wanted to prepare a new constitution and was soon dissolved. After that Cromwell resorted to open military government, dividing England into 11 districts, each administered by a major-general. Another, more amenable Parliament was summoned in 1656, and in 1657 it presented to Cromwell a new constitution known as the Humble Petition and Advice and offered him the crown. He declined the crown but accepted (with some modifications) the Humble Petition, which further increased his power and set up a second legislative chamber. The second session of this same Parliament, however, challenged the new constitution, and Cromwell dissolved it (1658) seven months before his death. Cromwell's foreign policy was governed by the need to expand English trade and prevent the restoration of the Stuarts, and by the desire to build up a Protestant league and enhance the prestige of the English republic. He approved the Navigation Act of 1651, which led to the first (1652–54) of the DUTCH WARS, and he pressed the war against Spain (1655–58) as a means of encroaching on Spanish rights of colonization in America. The Dutch war resulted in several important naval victories for the English under Admiral Robert BLAKE, but the Spanish war, apart from the sinking of a Spanish fleet (also by Blake), brought only Jamaica and imposed a great strain on English finances. Although Cromwell professed love for both toleration and constitutional government, only Jews and non-Anglican Protestants (excepting Quakers) were tolerated during his rule, and he found it impossible to cooperate with Parliament in governing. Opinions of Cromwell have always varied widely. His military skill and force of character are universally recognized. He met the task of holding together the gains of the civil wars and the disharmonious groups in the Puritan party in what seemed the only practical way. This involved cruelty, force, and intolerance, which were evidently alien to him personally. His government, dependent on his own strong character, costly in its foreign policy, and representing a break in English institutions and a minority religious viewpoint, could not survive him long. He was succeeded as protector by his son Richard. See the writings and speeches of Oliver Cromwell (ed. by W. C. Abbott and others, 4 vol., 1937–47), biographies by M. P. Ashley (1969), J. E. C. Hill (1970), C. V. Wedgwood (rev. ed. 1973), and Antonia Fraser (1973), M. P. Ashley, *The Greatness of Oliver Cromwell* (1957, repr. 1966), writings on the period by Samuel Rawson GARDINER and Sir Charles FIRTH.

Cromwell, Richard, 1626–1712, lord protector of England, third son of Oliver Cromwell. He was the eldest surviving son at the death of his father (Sept. 3, 1658), who had nominated him as his successor. Although he had served in Parliament and on the council of state, Richard lacked the energy and experience to manage complicated affairs of state. Army and Parliament struggled for power, and the army forced Richard to dismiss Parliament on April

22, 1659. His Protectorate had actually collapsed, but it continued in name until May 25, when the Rump Parliament, which had reassembled itself, reestablished the Commonwealth. He lived abroad (1660–80) and later in England under an assumed name. A man of integrity and dignity, he was unfortunate in being forced into a situation too difficult for his talents. See biography by R. W. Ramsay (1935), study by E. M. Hause (1972).

Cromwell, Thomas, earl of Essex, 1485?–1540, English statesman. While a young man he lived abroad as a soldier, accountant, and merchant, and on his return (c. 1512) to England he engaged in the wool trade and eventually became a lawyer. He entered Parliament in 1523 and soon became legal secretary to Cardinal WOLSEY, for whom he managed the suppression of minor monasteries. He avoided being disgraced with Wolsey in 1529, and by 1531 was serving HENRY VIII as a member of the privy council. By 1532 he had become the king's chief minister and was responsible for drafting most of the acts of Parliament by which the Reformation was effected. He probably originated the idea of making the king supreme head of the Church in England. As Henry's vicar-general after 1535, he supervised (1536–9) the visitation and suppression of monasteries and the confiscation of monastic lands and wealth. Much of Cromwell's unpopularity with the people, demonstrated by the PILGRIMAGE OF GRACE, derived from the ruthlessness of his agents in carrying out that project. He issued injunctions to the clergy, regulating their conduct and duties, assailed the worship of images and relics, and initiated a much-needed system of parish registers. He was made a baron and lord privy seal in 1536, lord great chamberlain in 1539, and earl of Essex in 1540. He negotiated the king's marriage to ANNE OF CLEVELAND as a means of securing the North German princes as allies against the Catholic Holy Roman emperor Charles V. When Anne proved unattractive and the alliance failed, Henry allowed charges of treason and heresy to be brought against Cromwell by his bitter enemy the duke of Norfolk. Cromwell was condemned by act of attainder and beheaded. See biographies by R. B. Merriman (1902), Theodore Maynard (1950), and A. G. Dickens (1959), G. R. Elton, *The Tudor Revolution in Government* (1953) and *Reform and Renewal* (1973).

Cronaca, Il' see POLLAIUOLO

Cronin, A. J. (Archibald Joseph Cronin), 1896–, Scottish novelist. He gave up his prosperous London medical practice to devote himself to writing after the success of his first novel, *Hatter's Castle* (1931). His novels, written in a direct simple style, reflect both his religious beliefs as a Roman Catholic and his medical training. He is best known for *The Citadel* (1937), *The Keys of the Kingdom* (1941), *The Green Years* (1944), *Shannon's Way* (1948), and *Pocketful of Rye* (1969).

Cronje, Piet Arnoldus (pēt arnōld'as krōn'yā), 1835?–1911, South African military commander. A Boer, he commanded the Transvaal forces that frustrated the raid against the Transvaal led by Sir Leander Starr Jameson. In the South African War (1899–1902), Cronje conducted the unsuccessful siege of Kimberley. Retreating west before the advance of Lord Roberts, he was surrounded (1900) at Paardeberg and forced to surrender.

Cronkite, Walter, 1916–, American radio and television newsman, b St. Joseph, Mo. He left the Univ. of Texas to write for the *Houston Press* and later for other Scripps-Howard newspapers. In 1939 he became a wire-service reporter with United Press, serving as a war correspondent (1942–45) and as a reporter at the Nuremberg trials. He joined the Columbia Broadcasting System in 1950 and in 1962 became managing editor and anchorman of "The CBS Evening News with Walter Cronkite." In 1973 a national poll indicated that he was the most trusted newsman in the United States. His books include *Challenges of Change* (1971).

Cronstadt: see KRONSTADT, USSR

Cronstedt, Axel Fredrik, Baron (āk'sal frā'drīk, krōn'stēt), 1722–65, Swedish mineralogist and chemist. In 1751 he discovered in niccolite an impure form of nickel, reported it as a newly discovered element, and proposed the name nickel for it. He was one of the first to recognize the importance of the chemical constituents of minerals and rocks and to use the blowpipe in the study of minerals. He wrote *An Essay towards a System of Mineralogy* (1758, tr. 2d ed., 1788).

Cronus (krō'nās), in Greek legend, the youngest Titan, son of Uranus and Gaea. With the help of his mother, he led the Titans in the revolt against Ura-

nus and ruled the world. He married his sister Rhea and fathered the great gods—Zeus, Poseidon, Demeter, Hera, Hades, and Hestia. Because he was fated to be overthrown by one of his children, he swallowed them all as infants until Rhea hid Zeus and presented Cronus with a stone wrapped in a blanket, which he ate. Later Zeus tricked him into disgorging his children. Zeus then led the Olympian gods in overthrowing Cronus in the battle called the Titanomachy, described by Hesiod. Cronus and all the defeated Titans, except Atlas, were exiled. Cronus is equated with the Roman Saturn and was probably a god of a pre-Hellenic people.

Crook, George, 1828–90, U.S. general, b. near Dayton, Ohio, grad. West Point, 1852. During the Civil War, Crook commanded a regiment of Ohio volunteers as colonel. After the war he operated so successfully against the Paiute and Snake Indians in Idaho and the Apache in Arizona that he was promoted (1873) to brigadier general in the regular army. Made commander of the Dept. of the Platte in 1875, he was engaged in the hard-fought Sioux War of 1876. In Arizona in 1883, Crook led an expedition into the mountains against a Chiricahua band of the Apache and finally succeeded in persuading GERONIMO to return to the reservation (1884). Later, Geronimo broke his pact and escaped, which led to censure of Crook's policies and his voluntary resignation. From 1888 until his death Crook was major general and commander of the Division of the Missouri. Although his fame rested upon his Indian campaigns, Crook also had a reputation for enlightened patience and integrity in dealing with Indian affairs, preferring negotiation to warfare. See his autobiography (ed. by M. F. Schmitt, 2d ed. 1960) and contemporary accounts by J. F. Finerty (1961) and Charles King (rev. ed. 1964).

Crooked Island: see BAHAMA ISLANDS

Crookes, Sir William, 1832–1919, English chemist and physicist. After serving at the Radcliffe Observatory, Oxford, and teaching chemistry at Chester Training College, he retired to work in his own laboratory in London. He discovered the element thallium and made special studies of radioactive substances in the course of which he invented the spintharoscope, used to make visible the flashes produced by bombarding a screen with the alpha rays of a particle of radium, and he devised the radiometer, which measures the intensity of radiant energy. He also intensively studied the rare earths and diamonds. Crookes devised spectacles to protect the eyes of glassworkers from damaging rays. One of his chief inventions is the Crookes tube, with which J. J. Thomson, W. C. Roentgen, R. A. Millikan, and others conducted important research. He founded the *Chemical News* in 1859 and was the author of numerous scientific papers and of *Select Methods in Chemical Analysis* (1871). Crookes was also interested in psychical research.

Crookes tube, device invented by Sir William Crookes (c.1875) consisting essentially of a sealed glass tube from which nearly all the air has been removed and through the walls of which are passed two electrodes. When a high voltage is applied between the two electrodes, electrons are emitted from the CATHODE and are accelerated toward the anode. Many of these electrons, or cathode rays (as they are usually called), miss the anode and strike instead the glass wall of the tube, causing it to exhibit fluorescence. The behavior of the rays indicates that they travel in straight lines and exert a pressure on any object placed in their path. The Crookes tube was used by Crookes in a number of experiments and was later used in experiments leading to the discovery of X rays by W. C. Roentgen (1895) and of the electron by J. J. Thomson (1897).

Cropsey, Jasper Francis, 1823–1900, American artist, b. Staten Island, N.Y. Trained as an architect, Cropsey designed two churches in Staten Island and several stations on the Sixth Ave. elevated railway in Manhattan. He was a founder of the American Water Color Society and is noted for his landscapes and Civil War scenes.

croquet (krōk'ā'), lawn game in which the players hit wooden balls with wooden mallets through a series of 9 or 10 wire arches, or wickets. The first player to hit the posts placed at each end of the field wins. The game developed in France in the 17th cent. and has been popular also, with varying rules, in Great Britain and the United States. *Rogue* (minus the first and last letters of *croquet*) is an American variant devised in 1899. See Paul Brown, *Croquet* (1957), A. G. F. Ross, *Croquet Handbook* (1959), J. W. Solomon, *Croquet* (1966).

Crosby, Bing, 1904–, American singer and film actor, b. Tacoma, Wash., as Harry Lillis Crosby. He sang with dance bands from 1925 to 1930, in 1931 he began work in radio and films and gained enormous popularity for his "crooning" style. In 1944 he won an Academy Award for his performance in *Going My Way*. Crosby's other notable films include *The Country Girl* (1955) and *Stagecoach* (1966). See his autobiography, *Call Me Lucky* (1953), Kathryn Crosby, Bing and Other Things (1967).

Crosby, municipal borough (1971 pop. 57,405), Lancashire, NW England, on Liverpool Bay. Formed in 1937 from the urban districts of Great Crosby and Waterloo-with-Seaforth, Crosby is primarily residential. The local history of Crosby dates back more than 1,000 years. The Merchant Taylor's School for boys was founded in 1620. In 1974, Crosby became part of the new metropolitan county of Merseyside.

Cross, Wilbur Lucius, 1862–1948, American educator and public official, b. Mansfield, Conn., grad. Yale (B.A., 1885, Ph.D., 1889). He was instructor (1894–97), assistant professor (1897–1902), and professor (1902–30) of English at Yale, where he also was dean (1916–30) of the graduate school. Cross became well known as a literary critic, edited the *Yale Review* for almost 30 years, and was the author of *The Life and Times of Laurence Sterne* (1909), *The History of Henry Fielding* (1918), and books on the English novel. After he retired (1930) from Yale he turned to politics. As Democratic governor of Connecticut (1931–39), he brought about much reform legislation—abolition of child labor, governmental reorganization, and improved factory laws. See his autobiography, *Connecticut Yankee* (1943).

cross, widely used symbol. In various forms, it can be found in such diverse cultures as those of ancient India, Egypt, and the American Indians. It is found in the megalithic monuments of Western Europe. The most important use is among Christians, to whom it recalls the crucifixion of Jesus and man's redemption thereby. The Christian form of blessing by tracing a cross over oneself or another person or thing originated before A.D. 200. The oldest Chris-

ture was painted or in bas-relief, a style surviving in the Christian East. Older Western crucifixes often presented the Savior reigning, in robe and crown, the realistic dying figure, dating from the Renaissance, is now universal in Roman Catholicism. Devotion to the cross as a symbol of the Passion is an outstanding development (from the 11th cent.) in the history of Christian thought; it has ever since been an essential part of the public and private religious life of Roman Catholics. Protestants have been generally sparing in using the cross, even in blessings, and have abandoned the crucifix, but the symbolism has been retained in their literature (e.g., in the hymn, *When I Survey the Wondrous Cross*). The cross was the badge of the Crusades and was adopted as the emblem of the Templars, of the Knights Hospitalers (Knights of Malta), and of the Teutonic Knights. It became important in HERALDRY, FLAG designs, and DECORATIONS. There are many shapes of crosses. The Latin cross, the commonest, has upright longer than transom. With two transoms it is called an archiepiscopal or patriarchal cross, with three it is a papal cross. A cross widely used by Slavs and by others of Eastern rites has two transoms and a slanting crosspiece below. The Greek cross has equal arms. St. Andrew's cross is like an X, and the tau cross is like a T. The Celtic, or Iona, cross bears a circle, the center of which is the crossing. The Maltese cross and the swastika (an ancient and widely diffused symbol) are still more elaborate. Examples of artistic effort spent on crosses are seen in the monumental crosses of market, town, and wayside in Europe (e.g., at Cheddar, Malmesbury, and Winchester, England) and in the wayside calvaries of Austria and Brittany. Some of the finest art products of the Celts were stone crosses. (For the later Eleanor Crosses, see ELEANOR OF CASTILE). Processional crosses (on poles) lend themselves to elaboration. Crosses are also worn for personal adornment. Pectoral crosses and necklace crosses have given scope for fine enameling.

crossbill, bird of the genus *Loxia*, in the FINCH family. Its bill, crossed at the tips, is specialized for pulling apart pine cones and picking out the seeds. Crossbills are found in the evergreen forests of the Northern Hemisphere, as far south as NW Africa and Guatemala. Two species occur in the United States. The red crossbill (*L. curvirostra*) is found in Europe and in N and central Asia as well as in North America. Males have orange to dull red plumage, with black wings. The white-winged crossbill (*L. leucoptera*) occurs in northern Russia and in North America; the male of this species is rosy red and both sexes are marked with white wing bars. Females of both species are olive-gray and yellow; they lay three to four pale green, brown-spotted eggs, in well-formed nests built in trees. Crossbills are not considered migratory, but they shift their breeding grounds erratically, probably in response to the availability of pine cones. Sometimes they suddenly appear in large numbers in areas where they are rarely seen. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Fringillidae.

crossing over, process in genetics by which the two CHROMOSOMES of a homologous pair exchange equal segments with each other. Crossing over occurs in the first division of MEIOSIS. At that stage each chromosome has replicated into two strands called sister chromatids. The two homologous chromosomes of a pair synapse, or come together. While the chromosomes are synapsed, breaks occur at corresponding points in two of the non-sister chromatids, i.e., in one chromatid of each chromosome. Since the chromosomes are homologous, breaks at corresponding points mean that the segments that are broken off contain corresponding GENES, i.e., alleles. The broken sections are then exchanged between the chromosomes to form complete new units, and each new recombined chromosome of the pair can go to a different daughter sex cell. Crossing over results in RECOMBINATION of genes found on the same chromosome, called linked genes, that would otherwise always be transmitted together. Because the frequency of crossing over between any two linked genes is proportional to the chromosomal distance between them, crossing over frequencies are used to construct genetic, or linkage, maps of genes on chromosomes. MUTATIONS,

Types of crosses

tian remains contain drawings of crosses and cruciform artifacts, and the fact that the cross was the Christian emblem before the toleration of Christianity is shown by the vision of CONSTANTINE I. His mother, St. HELENA, is supposed to have found the True Cross at Calvary in 327, and the event is commemorated on May 3 as the Finding of the Cross. Splinters of the relic are widely distributed and honored by Roman Catholics and Orthodox Eastern. In 614, to the scandal of Christendom, Khosru II of Persia took the largest piece of the relic from Jerusalem. It was restored by Heraclius I in 627, the anniversary of this event is Sept. 14, the Exaltation of the Cross. The relic was lost in the Muslim occupation of Jerusalem. Use of the cross was one of the popular practices attacked by Byzantine iconoclasm and vindicated (787) by the Second Council of Nicaea. The crucifix—the cross with the figure of Jesus upon it—had already been established in use, at first, the fig-

temperature changes, and radiation all affect crossing over frequency. Under the microscope, a crossover has the appearance of an X and is called a chiasma.

crossword puzzle, word game played on a rectangle marked with white and black squares that may or may not form a design, crossword puzzles typically appear in newspapers. Two lists of numbered definitions are given, one for horizontal words, the other for vertical words. The puzzle is solved when all the words are correctly supplied. In the diagramless puzzle, there is no key to the length of the words used. A crossword puzzle inscription has been found on an ancient tomb in Egypt; the puzzle first appeared in the modern world in Great Britain in the 19th cent. as a children's game, and after 1920 it became popular with adults there and in the United States. See ACROSTIC, ANAGRAM.

Croswell case, U.S. court case involving freedom of the press. In 1803, Harry Croswell, the editor of the *Wasp of Hudson, N.Y.*, was convicted of libeling President Thomas Jefferson in his newspaper. In his appeal of the conviction to the New York supreme court, Croswell was defended by Alexander Hamilton. In a famous brief, Hamilton argued that freedom of the press consisted in the right to print the truth, if with good motives and for justifiable ends, even if this truth reflected on "the government, magistracy or individuals." Although the court sustained the conviction, the legislature of New York incorporated Hamilton's position into law in 1805. It was the law of libel until 1964, when *New York Times Company vs. Sullivan* expanded the protection of the press.

Crothers, Rachel (krōth'arz), 1878-1958, American playwright and director, b. Bloomington, Ill., grad. Illinois State Normal Univ., 1892. Her plays, many of which were social comedies treating the ethical problems of women, were notable for their craftsmanship. Among her major successes were *The Three of Us* (1906), *A Man's World* (1909), *He and She* (1911), *Old Lady 31* (1916), *Let Us Be Gay* (1929), and *Susan and God* (1937).

Croton, Italy. See CROTONA.

Crotona (krōtō'na) or **Croton** (krō'tan), ancient city, S. Italy, on the east coast of Bruttium (now Calabria), a colony of MAGNA GRAECIA founded c. 708 B.C. There Pythagoras established his school, which exerted a notable political and moral influence. The nearby temple of Hera Lacinia was the religious shrine of Magna Graecia. Crotona's athletes won fame at the Olympic games. The height of the city's prosperity was reached after the army, led by the athlete Milo, destroyed the rival town of Sybaris (510 B.C.). Crotona then became involved in wars and soon declined. It was captured by the Romans in 277 B.C., until modern times it was never more than a provincial town. It was called Cotrone from the Middle Ages until 1928, when its name was changed to Crotona.

Croton Aqueduct (krō'tan), 38 mi (61 km) long, SE N.Y., carrying water from the Croton River basin to New York City, built 1837-42. It was one of the earliest modern aqueducts in the United States. Water impounded by New Croton Dam (completed 1905) is channeled S. to the Bronx, for most of its length in a covered trench along the surface. Water is carried over the Harlem River into Manhattan by Highbridge, a Roman-type aqueduct bridge. New Croton Aqueduct (built 1885-91), 30.5 mi (49 km) long, supplements the flow of Croton Aqueduct. Deep underground tunnels, including one under the Harlem River, channel water from this aqueduct to New York City.

Croton bug. See COCKROACH.

Crotone. See CROTONA.

croup (krōp), acute obstructive laryngitis in young children, usually between the ages of three and six. The manifestations are a high-pitched cough and difficulty in breathing, owing to a spasm or swelling of the larynx. The cause can be an acute infection (especially by the influenza virus or diphtheria bacterium), an allergy, a tumor of the larynx, or obstruction by a swallowed object. Treatment depends on the cause, e.g., antibiotics are used in the case of bacterial infections, epinephrine and similar drugs in the case of allergy. The inhalation of steam from a vaporizer or hot-water faucet relieves breathing difficulties in most cases. In severe cases oxygen may be administered, or it may be necessary to cut an opening in the trachea to prevent suffocation.

crow, partially migratory black bird of the same family as the raven, the magpie, the jay, and the rook and the jackdaw of Europe. The American, or com-

mon, crow, about 19 in (49 cm) long, has a wingspread of over 3 ft (92 cm). Crows eat some eggs and nestlings and grain, but destroy many harmful insects and rodents. In winter they gather at night by thousands in communal roosts. Crows, along with the other members of the family Corvidae, are considered to be the most intelligent of all birds. They are easily tamed and can learn to mimic some human sounds. Their throaty "caw" is familiar, although they can also produce a musical warble. The fish crow of the Atlantic and Gulf coasts is smaller than the common crow. The carrion crow of Great Britain is a flesh-eating bird 18 to 20 in (46-51 cm) long. Crows are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Corvidae.

crowberry, evergreen alpine and arctic shrub of the genus *Empetrum* (or, sometimes, other related species), bearing black, red, or purple berrylike fruits. Some are cultivated in rock gardens. Crowberry is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, family Empetraceae.

crowfoot, name for plants with the leaf or some other part resembling the foot of a crow, particularly the BUTTERCUP.

Crow Indians, North American Indians whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see AMERICAN INDIAN LANGUAGES) and who call themselves the Absaroka, or bird people. They ranged chiefly in the area of the Yellowstone River and its tributaries and were a hunting tribe typical of the Plains cultural area. Their only crop was tobacco, which they used for pleasure and religious purposes. Until the 18th cent. the Crow lived with the HIDATSA INDIANS on the upper Missouri River, after a dispute they migrated westward until they reached the Rocky Mts. The Crow developed a highly complex social system that included, among other things, great care and attention for children. They were enemies of the Sioux and helped the white men in the Sioux wars. See R. H. Lowie, *The Crow Indians* (1935, repr. 1956), Peter Nabokov, *Two Leggings: The Making of a Crow Warrior* (1967).

Crowley, city (1970 pop. 16,104), seat of Acadia parish, SW La., inc. 1888. It is a shipping, milling, and storing center for one of the nation's largest rice-growing areas and has a rice experiment station. Oil and natural gas wells are located nearby.

crown, circular head ornament, symbolizing sovereign dignity (for crowns worn by nobles, see CORONET). The use of the crown as a symbol of royal rank is of ancient tradition in Egypt and the Orient. In ancient Greece and Rome, however, crowns—sometimes made of leaves—were merely wreaths, awarded to victors in athletic or poetic contests or bestowed on citizens in recognition of an act of public service. The crown as used in medieval and modern times is an elaboration of the DIADEM and is generally made of metal, often gold inlaid with precious gems. The crown became thoroughly identified with the functions of monarchy, and the term crown is often used in a purely institutional sense, as in crown lands, crown colonies, and crown debt. Among famous crowns of historic interest are the Lombard iron crown, kept at Monza, Italy, the crown of Charlemagne, at Vienna, Austria, and the sacred crown of St. Stephen of Hungary. These are exceptional in that they were used repeatedly over centuries for coronation ceremonies. Most crowns are of recent origin, although the jewels they contain are often taken from older crowns. The ancient crowns of England were destroyed under Oliver Cromwell. There are two crowns used by the British sovereigns: the crown of Edward the Confessor (a much-altered replica of the original crown) is used for the coronation ceremony in Westminster Abbey, and the imperial state crown is worn on state occasions. Crowns are also worn by the consorts and families of sovereigns. The triple crown of the popes, known as a tiara, dates from the 14th cent. Regardless of their actual shape, crowns are usually represented in heraldry as closed at the top by four arched bars called diadems and surmounted by a globe and a cross. In religion and art, a crown symbolizes sovereignty (Rev. 19:12) and also honor, especially the reward of martyrdom (Heb. 2:9).

Crowne, John, c. 1640-c. 1703, English playwright. The favorite playwright of Charles II, he is remembered for several rather mediocre comedies. Crowne was influenced by the French tradition, particularly by Molière, and the mental states of his characters are more important than plot. Among his plays are *Pandion and Amphigenia* (1665), *Sir Courtly Nice* (1685), and *The Married Beau* (1694).

crown gall: see GALL.

Crown Point. 1 City (1970 pop. 10,931), seat of Lake Co., NW Ind., inc. 1868. Film is processed, and truck conveyors, golf balls, feed grinders, and cabinets are made. 2 Town (1970 pop. 1,857), Essex Co., NE N.Y., on Lake Champlain. Crown Point is a summer resort on a historic site. The French realized the strategic importance of this point on the route from New York to Canada and in 1731 began building Fort St. Frederic. In the French and Indian Wars the fort successfully resisted (1755-56) early English attacks but was demolished (1759) before the advance of Jeffrey Amherst. The British began to build Fort Amherst (renamed Fort Crown Point) in 1759. Early in the American Revolution, Crown Point was captured (May 12, 1775) by Seth Warner and a detachment of Green Mountain Boys. After twice changing hands, it was finally abandoned (June 22, 1777) to Gen. John Burgoyne in the Saratoga campaign. Crown Point Reservation, with bathing and fishing facilities, a museum, and ruins of colonial forts, is nearby.

Croydon, borough (1971 pop. 331,851) of Greater London, SE England. The borough was created in 1965 by the merger of the county borough of Croydon with the urban district of Coulsdon and Purley. It has the largest population of the London boroughs. Scientific instruments, internal-combustion engines, and electronic equipment are manufactured, but Croydon is largely residential. Several office buildings have been constructed in the borough, which also has a technical college and a college of art.

crucible, vessel in which a substance is heated to a high temperature, as for fusing or calcining. The necessary properties of a crucible are that it maintain its mechanical strength and rigidity at high temperatures and that it not react in an undesirable way with its contents. PORCELAIN and GRAPHITE are two refractory materials widely used for crucibles, but FIREBRICK can be used as well, especially when vessels of large capacity are needed. The chamber at the bottom of a metal-refining furnace, in which the molten metal collects to be drawn off, is also known as a crucible.

crucifix: see CROSS.

crucifixion, hanging on a CROSS, in ancient times a method of CAPITAL PUNISHMENT. It was practiced widely in the Near East but not by the Greeks. The Romans, who may have borrowed it from Carthage, reserved it for slaves and despised malefactors. They used it frequently, as in the civil wars and in putting down the Jewish opposition. Crucifixion was probably at first a modification of hanging on a tree or impaling on a pole, and from such a connection come the synonyms tree and rood (i.e., rod or pole) for Jesus' cross. The Romans used mostly the T cross, the Latin cross, or St. Andrew's cross. Most ancient sources describe the cross Jesus died on as a Latin cross, the type most common in the liturgy of the West. It was common practice among the Romans to scourge the prisoner and to require him to carry his cross to the place of crucifixion. The prisoner was either nailed or tied to the cross, and, to induce more rapid death, his legs were often broken. See Mat. 27:24-61, Mark 15:15-47, Luke 23:13-56, John 19:13-42. Crucifixion was abolished when the empire became Christian. See also CALVARY and GOOD THIEF.

Cruden, Alexander, 1701-70, author of a famous biblical concordance, b. Aberdeen, Scotland. He spent most of his life near London. In 1737 he published his *Complete Concordance to the Holy Scriptures*, which went through several editions and is the basis of later biblical concordances.

crude oil: see PETROLEUM.

cruelty, prevention of. In the 19th cent. many laws were passed in Great Britain and the United States to protect the helpless, especially children, lunatics, and domestic animals, from willful and malicious acts of cruelty. At first, cruelty to animals was deemed criminal only when severe enough to constitute a public nuisance. But in 1822 the British Parliament passed the Martin Act for animal protection, and two years later Richard Martin formed the Society for the Prevention of Cruelty to Animals. The Cruelty to Animals Acts of 1849 and 1854 firmly established protection for animals. Not until 1884 was the first British law passed to protect children from cruelty. This movement to protect the helpless soon spread throughout Europe and to the United States, where the American Society for the Prevention of Cruelty to Animals was formed (1866) by Henry Bergh in New York City. The American Humane Association, for the protection of animals and chil-

dren, was organized in 1877. In the United States, as in Great Britain, protection of children came after that of animals, the first Society for the Prevention of Cruelty to Children having been formed in New York City in 1875. In all states, parents guilty of bodily cruelty to, or moral corruption of, their children may now be lawfully punished, and the children may be taken from them to become wards of the state (see CHILD ABUSE). Societies of both types—for the protection of children and of animals—promote better legislation and enforcement, investigate and report alleged cruelties, establish shelters and sometimes (animal) hospitals, and carry on education against cruelty. While most of these societies are private, philanthropic organizations, some receive public funds. See R. C. McCrea, *The Humane Movement* (1910, repr. 1969), L. G. Housden, *The Prevention of Cruelty to Children* (1955), P. P. Hallie, *The Paradox of Cruelty* (1969), David Bakan, *Slaughter of the Innocents* (1971).

Cruikshank, George (krōōk'shāngk), 1792–1878, English caricaturist, illustrator, and etcher, younger son of Isaac Cruikshank (1756–1810), caricaturist. Self-taught, George early gained a reputation for his humorous drawings and political and social satires. He succeeded James Gillray as the most popular caricaturist of his day. Cruikshank illustrated more than 850 books and contributed to such publications as the *Meteor*, the *Scourge*, and the *Satirist*. Among the best of his many illustrations are the famous *Life in London* (in collaboration with his brother), his masterly etchings for Grimm's *German Popular Stories*, and the 12 etchings in Richard Bentley's miscellany, which include the notable illustrations of *Oliver Twist*. In his later years Cruikshank made many drawings depicting the evils of intemperance, such as *The Drunkard's Children*, *The Bottle*, and *The Gin Trap*. Collections of his works are in the British and the Victoria and Albert museums. See biographies by Blanchard Jerrold (1882) and William Bates (2d ed. 1972), catalogues by A. M. Cohn (1924) and M. D. George (1949), study, ed. by R. L. Patten (1973).

cruiser, large, fast, moderately armed warship, intermediate in type between the aircraft carrier and the destroyer. During World War II, battle cruisers operated as small battleships, combining in one vessel maximum qualities of gun caliber, armor protection, and speed. Upon the retirement of the BATTLESHIP from the major navies of the world, the cruiser became the largest of the conventionally armed warships in commission. The cruiser's primary mission in modern warfare is to provide antiaircraft defense and gunfire support for aircraft carriers. Light cruisers, lightly armed and very fast, are often employed in scouting, police duties, and other jobs where speed rather than defensive strength is important. The advent of guided missiles as the primary offensive weapon of modern warfare has led to the conversion of many cruisers into guided-missile cruisers. The guided-missile cruiser *Long Beach* (completed 1961) was the first ship since World War II to be constructed for the U.S. navy from keel up as a cruiser; it was also the first nuclear-powered surface fighting ship in the world. See *Jane's Fighting Ships* (pub. annually since 1897), study by S. L. Poole (1970).

cruisers: see DOUGHNUTS

crumhorn, J-shaped, double-reed musical instrument used throughout Europe from the 15th cent. through the 17th cent. It possesses a soft, reedy tone. The reed is enclosed by a wooden cap with a

Tenor crumhorn

hole at the top through which the player blows. The cap serves as a wind chamber, which causes the reed to vibrate. The crumhorn is one of the ancestors of the OBOE.

Crump, Edward Hull, 1876–1954, American politician, Democratic boss of Tennessee, b. near Holly Springs, Miss. At first (1905–9) a municipal administrator in Memphis, Tenn., he was later mayor (1909–16, 1939–41) and Congressman (1931–35) from Tennessee. Meanwhile, he built an efficient political machine that dominated the state elections.

Crump's boss rule was upset in the 1948 Tennessee Democratic primaries, when his favored candidates for Senator and governor were beaten. See biography by W. D. Miller (1964).

Crusades, series of wars undertaken by European Christians between the 11th and 14th cent. to recover the Holy Land from the Muslims. In the 7th cent., Jerusalem was taken by the caliph UMAR. Pilgrimages (see PILGRIM) were not cut off at first, but early in the 11th cent. the FATIMID caliph Hakīm began to persecute the Christians and despoiled the Holy Sepulcher. Persecution abated after his death (1021), but relations remained strained and became more so when Jerusalem passed (1071) from the comparatively tolerant Egyptians to the Seljuk Turks, who in the same year defeated the Byzantine emperor Romanus IV at Manzikert. Late in the 11th cent., Byzantine Emperor ALEXIUS I, threatened by the Seljuk Turks, appealed to the West for aid. This was not the first appeal of the kind, while it may have helped to determine the time and the route of the First Crusade, 1095–99, its precise import is difficult to estimate. Direct impetus was given the crusade by the great speech of Pope URBAN II at the Council

Crusader States (c. 1140)

of Clermont (now Clermont-Ferrand), in 1095. Urban exhorted Christendom to go to war for the Sepulcher, promising that the journey would count as full penance and that the homes of the absent ones would be protected by a truce. The battle cry of the Christians, he urged, should be *Deus volt* [God wills it]. From the crosses that were distributed at this meeting the Crusaders took their name. Bishop ADEMAR was designated as papal legate for the crusade, and Count RAYMOND IV of Toulouse was the first of the leaders of the expedition to take the cross. Preached by many wandering preachers, notably PETER THE HERMIT, the movement spread through Europe and even reached Scandinavia. The chief factors that contributed to this enthusiastic response were the increase in the population and prosperity of Western Europe, the high point that religious devotion had reached, the prospect of territorial expansion and riches for the nobles, and of more freedom for the lower classes, the colonial projects of the Normans (directed against the Byzantine Empire as much as against the Muslim world), the desire, particularly of the Italian cities, to expand trade with the East, and a general awakening to the lure of travel and adventure. The conflict between spiritual and material aims, apparent from the first, became increasingly serious. The organized host of the crusade was preceded in the spring of 1096 by several undisciplined hordes of French and German peasants. WALTER THE PENNILESS led a French group, which passed peacefully through Germany and Hungary but sacked the district of Belgrade. The Bulgarians retaliated, but Walter reached Constantinople by midsummer. He was joined there by the followers of Peter the Hermit, whose progress had been similar. A German group started off by robbing and massacring the Jews in the Rhenish cities and later so provoked the king of Hungary that he attacked and dispersed them. The bands that had reached Constantinople were speedily transported by Alexius I to Asia Minor, where they were defeated by the Turks.

The survivors either joined later bands or returned to Europe. Alexius began to take fright at the proportions the movement was assuming. When, late in 1096, the first of the princes, Hugh of Vermandois, a brother of Philip I of France, reached Constantinople, the emperor persuaded him to take an oath of fealty. GODFREY OF BOUILLON and his brothers Eustace and Baldwin (later BALDWIN I of Jerusalem), Raymond IV of Toulouse, BOHEMOND I, TANCRED, Robert of Normandy, and Robert II of Flanders arrived early in 1097. At Antioch all except Tancred and Raymond (who promised only to refrain from hostilities against the Byzantines) took the oath to Alexius, which bound them to accept Alexius as overlord of their conquests. Bohemond's subsequent breach of the oath was to cause endless wrangling. The armies crossed to Asia Minor, took Nicaea (1097), defeated the Turks at Dorylaeum, and took Antioch (1098). Their campaign was completed in July, 1099, by the taking of Jerusalem, where they massacred the Muslims and Jews. The election of Godfrey of Bouillon as defender of the Holy Sepulcher marked the beginning of the Latin Kingdom of Jerusalem (see JERUSALEM, LATIN KINGDOM OF). A Latin patriarch was elected. Other fiefs, theoretically dependent on Jerusalem, were created as the crusade's leaders moved to expand their domains. These were the counties of Edessa (Baldwin) and Tripoli (Raymond) and the principality of Antioch (Bohemond). The First Crusade, which thus ended in victory, was the only crusade that achieved more than ephemeral results. Until the ultimate fall (1291) of the Latin Kingdom the brunt of the fighting in the Holy Land fell on the Latin princes and their followers and on the great military orders, the KNIGHTS HOSPITALERS and the KNIGHTS TEMPLARS, that arose out of the Crusades. The later Crusades were for the most part only expeditions to assist those who already were in the Holy Land, they are a single current, and dates are given them only for convenience. The Second Crusade, 1147–49, was preached by St. BERNARD OF CLAIRVAUX after the fall (1144) of Edessa to the Turks. It was led by Holy Roman Emperor CONRAD III, whose army set out first, and by King LOUIS VII of France. Both armies passed through the Balkans and pillaged the territory of the Byzantine emperor, MANUEL I, who provided them with transportation to Asia Minor in order to be rid of them. The German contingent, already decimated by the Turks, merged (1148) with the French, who had fared only slightly better, at Acre (Akko). A joint attack on Damascus failed because of jealousy and, possibly, treachery among the Latin princes of the Holy Land. Conrad returned home in 1148 and was followed (1149) by Louis. The Second Crusade thus ended in dismal failure. The Third Crusade, 1189–92, followed on the capture (1187) of Jerusalem by SALADIN and the defeat of GUY OF LUSIGNAN, REGINALD OF CHÂTILLON, and RAYMOND of Tripoli at Hattin. The crusade was preached by Pope Gregory VIII but was directed by its leaders—RICHARD I of England, PHILIP II of France, and Holy Roman Emperor FREDERICK I. Frederick set out first, but was hindered by the Byzantine emperor, ISAAC II, who had formed an alliance with Saladin. Frederick forced his way to the Bosphorus, sacked Adrianople (Edirne), and compelled the Greeks to furnish transportation to Asia Minor. However, he died (1190) in Cilicia, and only part of his forces went on to the Holy Land. Richard and Philip, uneasy allies, arrived at Acre in 1191. The city had been besieged since 1189, but the siege had been prolonged by dissensions between the two chief Christian leaders, Guy of Lusignan and CONRAD, marquis of Montferrat, both of whom claimed the kingship of Jerusalem. The city was nevertheless starved out by July, 1191, shortly afterward Philip went home. Richard removed his base to Jaffa, which he fortified, and rebuilt Ascalon (Ashqelon), which the Muslims had burned down. In 1192 he made a three-year truce with Saladin, the Christians retained Jaffa with a narrow strip of coast (all that remained of the Latin Kingdom of Jerusalem) and the right of free access to the Holy Sepulcher. Antioch and Tripoli were still in Christian hands, Cyprus, which Richard I had wrested (1191) from the Byzantines while on his way to the Holy Land, was given to Guy of Lusignan. In Oct., 1192, Richard left the Holy Land, thus ending the crusade. Pope INNOCENT III launched the Fourth Crusade, 1202–4, which was totally diverted from its original course. The Crusaders, led mostly by French and Flemish nobles and spurred on by FULK OF NEUILLY, assembled (1202) near Venice. To pay some of their passage to Palestine they aided Doge ENRICO DANDOLO (see under DANDOLO, family) and his Venetian forces in recovering Zara (Zadar).

on the Dalmatian coast from the Hungarians. The sack of Zara (1202), violently denounced by the pope, prefaced more serious political schemes. Alexius (later ALEXIUS IV), son of the deposed Byzantine emperor Isaac II and brother-in-law of PHILIP OF SWABIA, a sponsor of the crusade, joined the army at Zara and persuaded the leaders to help him depose his uncle, ALEXIUS III. In exchange, he promised large sums of money, aid to the Crusaders in conquering Egypt, and the union of the Roman and the Eastern churches. The actual decision to turn on Constantinople was largely brought about by Venetian pressure. The fleet arrived at the Bosphorus in 1203, Alexius III fled, and Isaac II and Alexius IV were installed as joint emperors while the fleet remained outside the harbor. In 1204, ALEXIUS V overthrew the emperors. As a result the Crusaders stormed the city, sacked it, divided the rich spoils with the Venetians according to a prearranged plan, and set up the Latin Empire of Constantinople (see CONSTANTINOPLE, LATIN EMPIRE OF). There followed the pathetic interlude of the *Children's Crusade*, 1212. Led by a visionary French peasant boy, Stephen of Cloyes, children embarked at Marseilles, hoping that they would succeed in the cause that their elders had betrayed. According to later sources, they were sold into slavery by unscrupulous skippers. Another group, made up of German children, went to Italy, most of them perished of hunger and disease. Soon afterward Innocent III and his successor, Honorius III, began to preach the *Fifth Crusade*, 1217–21. King Andrew II of Hungary, Duke Leopold VI of Austria, JOHN OF BRIENNE, and the papal legate Pelagius were among the leaders of the expedition, which was aimed at Egypt, the center of Muslim strength. Damietta (Dumyat) was taken in 1219 but had to be evacuated again after the defeat (1221) of an expedition against Cairo. The *Sixth Crusade*, 1228–29, undertaken by Holy Roman Emperor FREDERICK II, was simply a peaceful visit, in the course of which the emperor made a truce with the Muslims, securing the partial surrender of Jerusalem and other holy places. Frederick crowned himself king of Jerusalem, but, occupied with Western affairs, he did nothing when the Muslims later reoccupied the city. THIBAUT IV of Navarre and Champagne, however, reopened (1239) the wars, which were continued by Richard, earl of Cornwall. They were unable to compose the quarrels between the Knights Hospitallers and Knights Templars. In 1244 the Templars, who advocated an alliance with the sultan of Damascus rather than with Egypt, prevailed. A treaty (1244) with Damascus restored Palestine to the Christians, but in the same year the Egyptian Muslims and their Turkish allies took Jerusalem and utterly routed the Christians at Gaza. This event led to the *Seventh Crusade*, 1248–54, due solely to the idealistic enterprise of LOUIS IX of France. Egypt again was the object of attack. Damietta fell again (1249), and an expedition to Cairo miscarried (1250), Louis himself being captured. After his release from captivity, he spent four years improving the fortifications left to the Christians in the Holy Land. The fall (1268) of Jaffa and Antioch to the Muslims caused Louis IX to undertake the *Eighth Crusade*, 1270, which was cut short by his death in Tunisia. The *Ninth Crusade*, 1271–72, was led by Prince Edward (later EDWARD I of England). He landed at Acre but retired after concluding a truce. In 1289 Tripoli fell to the Muslims, and in 1291 Acre, the last Christian stronghold, followed.

Heritage of the Crusades. After the fall of Acre no further Crusades were undertaken in the Holy Land, although several were preached. Already, however, the term crusade was also being used for other expeditions, sanctioned by the pope, against heathens and heretics. ALBERT THE BEAR and HENRY THE LION led (1147) a crusade against the WENDS in NE Germany. Hermann von SALZA in 1226 received crusading privileges for the Teutonic Knights against the Prussians; the pope proclaimed (1228) a crusade against Emperor Frederick II, and several crusades were fought against the ALBIGENSES and the HUSSITES (see HUSSITE WARS). War against the Turks remained the chief problem of Eastern Europe for centuries after 1291. Campaigns akin to crusades were those of JOHN HUNYADI, JOHN OF AUSTRIA (d. 1578), and JOHN III of Poland. In their consequences, the crusades in Europe were as important as those in the Holy Land. However, although the Crusades in the Holy Land failed in their chief purpose, they exercised an incalculable influence on Western civilization by bringing the West into closer contact with new modes of living and thinking, by stimulating commerce, by giving fresh impetus to literature and invention, and by increasing geographical knowledge.

The crusading period advanced the development of national monarchies in Europe, because secular leaders deprived the pope of the power of decision in what was to have been the highest Christian enterprise. In the Levant the Crusades left a lasting imprint, not least on the Byzantine Empire, which was disastrously weakened. Physical reminders of the Crusades remain in the monumental castles built by the Crusaders, such as that of AL KARAK. The chief material beneficiaries of the Crusades were Venice and the other great Mediterranean ports. The ideal of chivalry was also developed by the Crusades. The chief collection of sources is *Recueil des historiens des croisades* (ed. by the Académie des Inscriptions et Belle-Lettres, 16 vol., 1841–1906), several chronicles are translated in the "Records of Civilization" series. Outstanding among eyewitness accounts are those of WILLIAM OF TYRE, RICHARD OF DEVIZES, Geoffroi de VILLEHARDOUIN, Jean de JOINVILLE, ANNA COMNENA, and Nicetas Acominatus. Treatments in English include Ernest Barker, *The Crusades* (1923, repr. 1971), A. S. Atiya, *The Crusade in the Later Middle Ages* (1938, repr. 1970), Steven Runciman, *A History of the Crusades* (3 vol., 1951–54, repr. 1962–66), K. M. Setton, ed., *A History of the Crusades* (2 vol., 1955–62, repr. 1969).

Crusca, Accademia della: see ACCADEMIA DELLA CRUSCA.

crusher, machine used to reduce materials such as ore, coal, stone, and slag to particle sizes that are convenient for their intended uses. Crushers operate by slowly applying a large force to the material to be reduced. Generally this is accomplished by catching it between jaws or rollers that move or turn together with great force. Reduction in size is generally accomplished in several stages, as there are practical limitations on the ratio of size reduction through a single stage.

Crusius, Christian August (krī's'tēān ou'gōōst krōō'zēōōs), 1715–75, German philosopher and theologian. He was educated at the Univ. of Leipzig, where he became professor of philosophy (1744) and theology (1750). He opposed the philosophies of G. W. Leibniz and Christian Wolff and strongly influenced the early writings of Immanuel KANT. None of his many works has been translated into English.

crustacean (krūs'tā'shən), primarily aquatic arthropod of the class Crustacea. Most of the 26,000 crustacean species are marine, but there are many freshwater forms. The few groups that inhabit terrestrial areas have not been particularly successful in an evolutionary sense, most require very humid environments in order to survive. Crustaceans can be divided according to size into two main groups. The larger group includes the familiar SHRIMP, CRAYFISH, LOBSTERS, and CRABS, all belonging to the order Decapoda, as well as the BARNACLES that constitute the subclass Cirripedia. The smaller group includes species that are either microscopic or range up to a few inches (about 5 cm) in size. Most of the smaller marine forms can be found in plankton (see MARINE BIOLOGY) and thereby occupy an important position

in the marine food chain, for example, the very large crustacean order Copepoda supplies the food of a still larger crustacean order the Euphausiids, which in turn constitutes krill, the principal food of baleen whales. Other copepods supply food for small fish, and still others exist as parasites on the skin and gills of fish. Best known of the smaller freshwater crustaceans are members of the genus *Daphnia* (water fleas), the fairy shrimp (a phyllopod that swims inverted), and *Cyclops* (a copepod). The order Isopoda includes the only large group of truly terrestrial crustaceans. Known as wood lice, sow bugs, or pillbugs, these small animals can be found under the bark of trees, beneath stones and rocks, and in other damp places. When disturbed they curl up armadillo-like, withdrawing into the exoskeleton. All crustaceans have bilaterally symmetrical bodies covered with a chitinous exoskeleton, which may be thick and calcareous (as in the crayfish) or delicate and transparent (as in water fleas). Since it does not grow, the exoskeleton must be periodically molted when the animal undergoes metamorphosis (typically from free-swimming larva to adult) or simply outgrows its shell. The free-swimming larva characteristic of crustaceans, called a nauplius larva, has an unsegmented body, a median eye, and three pairs of appendages. Like other arthropods, adult crustaceans have segmented bodies and jointed legs, the segments are usually grouped into a recognizable head, thorax, and abdomen. In the majority of larger crustaceans the head and thorax are fused into a cephalothorax, which is protected by a large shield-like area of the exoskeleton called the carapace. The head bears two pairs of antennae, usually one median eye and two lateral eyes, and three pairs of biting mouthparts—the mandibles and the two pairs of maxillae. Crustacean appendages have undergone extensive adaptation for various tasks such as swimming, sensory reception, and walking. Many species have the first pair of thoracic appendages modified into claws and pincers. The gills are generally attached at the bases of the thoracic appendages, and the beating of the appendages creates a flow of water over the gills that facilitates respiration. Reproduction is sexual, and in most forms the sexes are separate. In many species the eggs are brooded beneath the abdominal segments of the female. Crustaceans constitute the class Crustacea of the phylum ARTHROPODA.

Cruveilhier, Jean (zhā'n kruv'ēyā'), 1791–1874, French physician. The first professor of pathology at the Univ. of Paris (from 1836), he introduced the descriptive method into the study of that field. He was the first to describe multiple sclerosis adequately. His works include *The Anatomy of the Human Body* (2 vol., 1829–42, tr. 1844).

Crux (krōōks) [Lat. = cross], small but brilliant southern CONSTELLATION whose four most prominent members form a Latin cross, the famous Southern Cross. The long arm of the cross, terminating in the brightest member, ACRUX (Alpha Crucis), points almost directly at the south celestial pole. Two other stars, MIMOSA (Beta Crucis) and Gacrux (Gamma Crucis) are also among the brightest in the sky. Also

Internal anatomy of a female crayfish, representative of the class Crustacea

in Crux is the Coalsack, a famous dark nebula. Crux reaches its highest point in the evening sky in May, its location in the far southern sky makes it visible most of the year to southern observers but not at all to observers north of about 25°N lat.

Cruz, Juana Inés de la: see JUANA INÉS DE LA CRUZ.

Cruz, Juan de la: see JOHN OF THE CROSS, SAINT.

Cruz, Ramón de la (ramón' dā la krōōth), 1731-94, Spanish dramatist. He wrote tragedies and adapted French and Italian plays, but he owes his fame to his *sainetes*, some 450 masterly one-act comedies that depict the life of the middle and lower classes. His work freed the awakening Spanish drama from foreign influence.

cryogenics: see LOW-TEMPERATURE PHYSICS.

cryolite or **kryolite** (both krī'ālīt) [Gr., = frost stone], mineral usually pure white or colorless but sometimes tinted in shades of pink, brown, or even black and having a luster like that of wax. Chemically, it is a double fluoride of sodium and aluminum, Na_3AlF_6 . Its principal use is as a flux in the smelting of aluminum. It is used also as a source of soda, aluminum salts, fluorides, and hydrofluoric acid (by the action of sulfuric acid). It was discovered in Greenland in 1794 and occurs almost nowhere else. Cryolite has been produced synthetically.

cryosurgery (krī'ōsūr'jārē), bloodless surgical technique using a supercooled probe to destroy diseased tissue. Liquid nitrogen circulating through the instrument cools it to temperatures as low as -196°C. Tissue destroyed on contact with the probe is removed by natural body processes. The method has proved successful in removal of tonsils, tumors, hemorrhoids, and cataracts, and in treating various brain disorders. Surgeons have been successful in treating PARKINSONISM with the cryogenic probe, the small areas of the brain that are believed responsible for the symptoms can be frozen temporarily at 0°C and thawed if the symptoms do not disappear. When the correct location is found, the tissue can be quickly supercooled and destroyed.

cryotron (krī'ōtrān'), magnetically controlled electronic switching device that operates at extremely low temperatures, it is designed to supplant, in part, the transistor in special electronic equipment (e.g., the computer). One type of cryotron consists of a straight wire (the gate) around which a wire coil (the control coil) is wound. Kept at temperatures near absolute zero, both wires become superconductors (see LOW-TEMPERATURE PHYSICS, SUPERCONDUCTIVITY), but when current is passed through the coil, a magnetic field is induced that causes the gate to lose its superconductivity, thus switching off the current through it. Another type of cryotron uses conducting films in place of the wires to increase the switching speed. The cryotron is so minute that many of these devices can be packed into a very small area, thereby greatly increasing the degree of control.

crypt (krīpt) [Gr., = hidden], vault or chamber beneath the main level of a church, used as a meeting place or burial place. It undoubtedly developed from the catacombs used by early Christians as places of worship. Early churches were commonly built over the tombs of martyrs. Such vaults, located beneath the main altar, developed into the extensive crypts of the Middle Ages that in many churches of the 11th and 12th cent. occupied the entire space beneath the sanctuary. At Canterbury the 12th-century crypt forms a large and complete lower church in itself. The crypt of the Rochester Cathedral is partly above ground. The cathedrals at Chartres and at Bourges have crypts typical of the Gothic development.

cryptococcosis: see FUNGUS INFECTION.

cryptogam, in botany, term used to denote a plant that produces spores, as in ALGAE, FUNGI, MOSSES, and FERNS, but not seeds. The term *cryptogam*, from the Greek *kryptos*, meaning "hidden," and *gamos*, meaning "marriage," was coined by 19th-century botanists because the means of sexual reproduction in these plants was not then apparent. In contrast, in the seed plants the reproductive organs are easily seen, the seed plants have accordingly been termed *phanerogams*, from the Greek *phaneros*, meaning "visible."

cryptography (krīptōg'rāfē) [Gr., = hidden writing], science of secret writing. There are many devices by which a message can be concealed from the casual reader, e.g., invisible writing, but the term *cryptography* strictly applies to translating messages into cipher or code. The science of breaking codes and ciphers without the key is called *cryptanalysis*. *Cryp-*

tology is the science that embraces both cryptography and cryptanalysis. In enciphering, each letter of the message is replaced by another letter or figure, in encoding, syllables, words, or whole sentences are treated. The code is the agreed upon set of rules whereby messages are converted from one form to another. The beginnings of cryptography can be traced to the hieroglyphs of early Egyptian civilization (c. 1900 B.C.). Ciphering has always been considered vital for diplomatic and military secrecy, the Bible is replete with examples of ciphering, and many figures throughout history have written in ciphers, including Julius Caesar, Charlemagne, Alfred the Great, Mary Queen of Scots, and Louis XIV. Francis Bacon's celebrated bilateral cipher (1605) was an arrangement of the letters *a* and *b* in five-letter combinations, each representing a letter of the alphabet. This code illustrates the important principle that a code employing only two different signs can be used to transmit information. In the 20th cent. mathematical theory and computer science have both been applied to cryptanalysis. As the science of cryptography becomes increasingly sophisticated, most nations have found it necessary to develop special governmental bureaus to handle diplomatic and military security, e.g., the National Security Agency in the United States. See Helen Gaines, *Cryptanalysis* (1956), David Kahn, *The Codebreakers* (1967), J. R. Wolfe, *Secret Writing: The Craft of the Cryptographer* (1970).

Cryptophyta, small division of the plant kingdom, consisting of only one class and one order of photosynthetic, unicellular, flagellate ALGAE of both fresh water and marine habitats. There are only a few genera and fewer than 90 species, most of them rare. The cells are somewhat flattened and often asymmetric in shape. The cell wall, when present, may be of cellulose, and is often in the form of a sheath called a lorica. The cell chloroplasts contain CAROTENES, the photosynthetic pigments chlorophyll *a* and chlorophyll *c*, and pigments unique to this division, the brown or yellow xanthophylls, which give the cells a brownish color.

crypts of Lieberkuhn: see DIGESTIVE SYSTEM.

Crystal, city (1970 pop. 30,925), Hennepin co., SE Minn., a suburb of Minneapolis.

crystal, a solid body bounded by natural plane faces that are the external expression of a regular internal arrangement of constituent atoms, molecules, or ions. The particles in a crystal occupy positions with definite geometrical relationships to each other. The positions form a kind of scaffolding, called a crystal lattice, the atomic occupancies of lattice positions are determined by the chemical composition of the substance. The formation of a crystal by a substance passing from a gas or liquid to a solid state, or by going out of solution (by precipitation

or evaporation), is called crystallization. A crystalline substance is uniquely defined by the combination of its chemistry and the structural arrangement of its atoms. In all crystals of any specific substance the angles between corresponding faces are constant (Steno's Law, or the First Law of Crystallography). Crystalline substances are grouped, according to the type of symmetry they display, into 32 classes. These in turn are grouped into seven systems on the basis of the relationships of their axes, i.e., imaginary straight lines passing through the ideal centers of the crystals. Crystals may be symmetrical with relation to planes, axes, and centers of symmetry. Planes of symmetry divide crystals into equal parts (mirror images) that correspond point for point, angle for angle, and face for face. Axes of symmetry are imaginary lines about which the crystal may be considered to rotate, assuming, after passing through a rotation of 60°, 90°, 120°, or 180°, the identical position in space that it originally had. Centers of symmetry are points from which imaginary straight lines may be drawn to intersect identical points equidistant from the center on opposite sides. The crystalline systems are cubic, or isometric (three equal axes, intersecting at right angles), hexagonal (three equal axes, intersecting at 60° angles in a horizontal plane, and a fourth, longer or shorter, axis, perpendicular to the plane of the other three), tetragonal (two equal, horizontal axes at right angles and one axis longer or shorter than the other two and perpendicular to their plane), orthorhombic (three unequal axes intersecting at right angles), monoclinic (three unequal axes, two intersecting at right angles and the third at an oblique angle to the plane of the other two), trigonal, or rhombohedral (three equal axes intersecting at oblique angles), and triclinic (three unequal axes intersecting at oblique angles). In all systems in which the axes are unequal there is a definite axial ratio for each crystal substance. Crystals differ in physical properties, i.e., in hardness, cleavage, optical properties, heat conductivity, and electrical conductivity. These properties are important since they sometimes determine the use to which the crystals are put in industry. For example, crystalline substances that have special electrical properties are much used in communications equipment. These include quartz and Rochelle salt, which supply voltage upon the application of mechanical force (see PIEZOELECTRIC EFFECT), and germanium, silicon, galena, and silicon carbide, which carry current unequally in different crystallographic directions (semiconductor rectifier). See SOLID, SOLID STATE PHYSICS. See F. C. Phillips, *An Introduction to Crystallography* (1970), J. D. Dana, *Manual of Mineralogy* (18th ed., rev. by C. S. Hurlbut, Jr., 1971).

crystal gazing, form of DIVINATION in which a medium achieves CLAIRVOYANCE by staring steadily into a clear surface, such as a crystal ball, a pool, a mirror, or other bright object. It is in such a state that the crystal gazer is supposedly able to perceive persons or events that are distant in time or space. This ancient and widespread practice has its origin in the belief that certain objects have supernatural powers. In recent times the crystal ball has been used by some spiritualists as a vehicle through which contact is made with the dead. Colloquially, the term is often used to describe any irresponsible or unfounded prediction about the future. See SPIRITISM.

Crystal Lake, city (1970 pop. 14,541), McHenry co., NE Ill., in a dairy farm and lake resort area, inc. 1874. Electrical components, drills, and tools are manufactured. A junior college is there.

Crystal Palace, building designed by Sir Joseph PAXTON and erected in Hyde Park, London, for the Great Exhibition in 1851. In 1854 it was removed to Sydenham, where, until its damage by fire in 1936, it housed a museum of sculpture, pictures, and architecture and was used for concerts. In 1941 its demolition was completed because it served as a guide to enemy bombing planes. The building was constructed of iron, glass, and laminated wood. One of the most significant examples of 19th-century, proto-modern architecture, it was widely imitated in Europe and America.

CS, chemical symbol of the element CESIUM.

CS, chemical compound (orthochlorobenzalnitrite) used in riot control and, by the military, as a harassing agent. The compound is dispersed as an aerosol or as a finely divided powder. Exposure to CS causes intense pain in the eyes and upper respiratory tract, the pain spreads to the lungs and gives the sensation of suffocation. In humid weather CS may cause severe blistering of the skin. Heavy exposure to the compound may cause serious lung dam-

Types of crystal

age, resulting in death. Nonetheless, CS is less toxic than many other TEAR GASES. CS was first synthesized in the 1920s by Ben Carson and Roger Staughton; the compound's name is derived from their initials. **Csaba**: see **BÉKÉSCSABA**, Hungary.

Csepel (chě'pēl), island, c 100 sq mi (260 sq km), 30 mi (48 km) long, in the Danube, N central Hungary, just S of Budapest. In the northern section are the city and harbor of the same name, and there is an international free port. An industrial suburb of Budapest, the city of Csepel has ironworks and steelworks, an oil refinery, munitions factories, and motorcycle works. The rest of the island is agricultural.

Ctenophora (tīnōf'arə), a small phylum of exclusively marine, solitary invertebrate animals, commonly known as sea walnuts or comb jellies. Ctenophores are characterized by eight unique rows (combs) consisting of ciliated plates called ctenes, which are radially arranged on the spherical body surface. The animals swim weakly, powered by those structures. The two hemispheres of the ctenophore body are marked by a mouth, or oral pole, on the underside, and an opposite aboral pole, on which is located the statocyst, a unique sense organ controlling equilibrium. Most ctenophores resemble biradially symmetrical (see **SYMMETRY**, **BIOLOGICAL**) jellyfish (phylum **CNIDARIA**) but lack the cnidian whorl of tentacles around the mouth, and all but one species (*Euchlora rubra*) lack nematocysts, specialized stinging cells. Ctenophores, which are all carnivorous, have specialized adhesive cells called

Pleurobrachia, representative of the phylum Ctenophora

colloblasts, used to capture planktonic animals on which the ctenophores feed. Less than one hundred species are known, but many become locally abundant and are ecologically significant. They vary from less than 1/4 in (0.6 cm) to over 1 ft (30.5 cm) long. Most are transparent, but pale pinks, reds, violets, and oranges are also known in some species. All ctenophores are bioluminescent, the production of light originating in the walls of the eight canals. The phylum is also characterized by hermaphroditism. There are two classes, **Tentaculata** and **Nuda**.

Class Tentaculata Members of this class are characterized by having tentacles, typically two feathery ones that can be retracted into specialized sheaths. In some, there are smaller, secondary tentacles, and the primary tentacles are reduced. This class includes the small, oval sea gooseberries (genus *Pleurobrachia*), common on both Atlantic and Pacific coasts. The more flattened species of the genus *Mnemiopsis*, about 4 in long (10 cm), is common on the upper Atlantic coast; it has a large mouth and feeds mainly on larval mollusks and copepods. This species is especially brilliantly luminescent. The similar, but larger, genus *Leucothea* is abundant on the Pacific coast. Venus's girdle (genus *Cestum*) is a flattened, ribbonlike form reaching over 1 yd (91 cm) in length, and found in tropical waters.

Class Nuda This class includes species that have no tentacles. Typical is the large-mouthed genus *Beroë*, which feeds on jellyfish and other ctenophores. See P. A. Maglitsch, *Invertebrate Zoology* (1967), M. S. Gardiner, *The Biology of Invertebrates* (1972).

Ctesias (tēs'shēas, tēs'sēas), fl 400 B.C., Greek historian and physician of Cnidus. He lived many years in the Persian court. He tended Artaxerxes II when he was wounded in the battle of Cunaxa (401 B.C.). In 398 he was sent by the Persians as envoy to Evagoras and Conon. Of Ctesias' histories only Photius' abridgments of *Persica* and *Indica* remain, in them Ctesias hoped to show Herodotus' unreliability.

Ctesibius (tīsīb'ēas), fl 2d cent B.C., Alexandrian Greek inventor. He reputedly was the first to discover and apply the expansive power of air as a motive force. Among the inventions ascribed to him are a water clock (clepsydra), a hydraulic organ, and a force pump.

Ctesiphon, ruined ancient city, 20 mi (32 km) SE of Baghdad, Iraq, on the left bank of the Tigris opposite Seleucia and at the mouth of the Diyala River. After 129 B.C. it was the winter residence of the Parthian kings. Ctesiphon grew rapidly and was of renowned splendor. The Romans captured it in warring against Parthia. It became the capital of the Sassanids in c 224 and a center of Nestorian Christianity. In 637 it was taken and plundered by the Arabs who renamed it, along with Seleucia, Al Madain; it was abandoned by them when Baghdad became the capital of the Abbasids. Its site marks the farthest advance of Great Britain against the Ottoman Empire (Turkey) in World War I. It is now noted for its impressive ruins.

CTP (cytidine triphosphate) see **CYTOSINE**

Cu, chemical symbol of the element **COPPER**

Cuala Press (kōō'lā), private printing press founded in Dundrum, Ireland, in 1902 by Elizabeth and Lily Yeats, the sisters of William Butler Yeats. Called the Dun Emer Press until 1908, it began as part of a larger company whose purpose was to provide employment for Irish women. Until it ceased operation in the late 1940s, the press followed a program of publishing works by contemporary Irish writers and new editions and translations of Irish classics. Its publications emphasized literary merit rather than fine printing. Among the authors whose works were published by the Cuala Press are Yeats, Lionel Johnson, Lady Gregory, John Millington Synge, John Masefield, and Louis MacNeice.

Cuanza or Kwanza (both kwān'zā), river, 600 mi (966 km) long, rising in central Angola and flowing NW and W to the Atlantic. Its lower course, which is navigable for c 160 mi (260 km), was the original route of Portuguese penetration into N Angola. The large Cambambe project, on the lower Cuanza, produces hydroelectric power and supplies water for irrigation. Sugarcane is grown in the lower Cuanza valley.

Cuauhtémoc (kōō-outā'mōk), d 1525, Aztec emperor. Succeeding the brother of MONTÉZUMA II in 1520, Cuauhtémoc failed to unite the Indian city-states of the Valley of Mexico against the Spanish after the expulsion of Hernán CORTÉS from TENOCHTITLÁN. He courageously defended his capital, but was taken prisoner when it fell (1521) after a three-month siege. Tortured to reveal his treasure, Cuauhtémoc replied that it lay at the bottom of the lake—where the Spaniards had perished with it in their flight from Tenochtitlán on the *noche triste* [sad night]. Cortés took Cuauhtémoc with him on his march to Honduras and, accusing the Aztec of treason, had him hanged. The name occurs also as Cuauhtemotzín, Guatémoc, Guatemozín, and Quauhtemoc.

Cuautla (kwou'tlā), city (1970 pop 67,869), Morelos state, S Mexico, in the Cuautla River valley. It is a highway junction and the heart of a sugarcane and rice district. Cuautla's hot springs and lovely scenery make it a popular resort and tourist attraction. Historically, Cuautla is famous for the heroic defense made there in 1812 by patriot forces under José María Morelos y Pavón, who cut through Spanish besieging forces. The city is sometimes called Ciudad Morelos.

Cuba (kyōō'ba, Span kōō'bā), republic (1970 pop 8,553,395, including the Isle of Pines), 44,218 sq mi (114,524 sq km), consisting of the island of Cuba and numerous adjacent islands. HAVANA is the capital. Cuba is the largest and westernmost of the West Indies and lies strategically at the entrance of the Gulf of Mexico, with the western section only 90 mi (145 km) S of Key West, Fla. The south coast is washed by the Caribbean Sea, the north coast by the Atlantic Ocean, and in the east the Windward Channel separates Cuba from Haiti. The shores are often marshy and are fringed by coral reefs and cays. There are many fine seaports—Havana (the chief import point), MATANZAS, CARDENAS, NUEVITAS (the chief export point), SANTIAGO DE CUBA, CIENFUEGOS, and GUANTANAMO (a U.S. naval base since 1903). Of the many rivers, only the Cauto is important. Cuba has three mountain regions: the wild and rugged Sierra Maestra in the east, rising to 6,560 ft (2,000 m) in the Pico Turquino, a lower range, the scenic Sierra de los Órganos, in the west, and the Sierra de Trinidad, a picturesque mass of hills amid

the plains and rolling country of central Cuba, a region of vast sugar plantations. The rest of the island is level or rolling. The topography, the semitropical

and generally uniform climate, and the soil are suitable for various crops, but sugarcane has been dominant since the late 18th cent.; it is grown on about two thirds of all crop land. Attempts at diversification have been only partially successful; the program of agrarian reform established by the revolutionary government of Fidel Castro failed to solve the problems arising from a one-crop economy, and sugar and its derivatives still account for about 85% of the value of all exports. Cattle raising is second in production value. An excellent tobacco is grown, especially in the VUELTA ABAJO region of Pinar del Río, and coffee, rice, corn, citrus fruits, and sweet potatoes are important. However, the emphasis on export crops (sugar and to a lesser degree tobacco) necessitates the importation of much food. Large-scale fishing operations have been encouraged under the Castro regime, and that industry is now one of the largest in Latin America. Cuban fishing fleets operate from Greenland to Argentina. Manufacturing is centered chiefly in the processing of agricultural products; sugar-milling has long been the largest industry, and Cuba is also known for its tobacco products. Some consumer goods (textiles, fertilizer, cement, etc.) are also manufactured. Mining has never been of major importance, although Cuba's nickel deposits are among the largest in the world. Extraction is difficult because of the presence of other metals in the nickel ore, but production has nevertheless increased considerably and nickel is now the country's second most valuable export item (after sugar). Large amounts of copper, chromite, and manganese are also mined, as well as lesser quantities of salt, lead, zinc, gold, silver, and oil. Limestone, clay, gypsum, and sulfur production easily meet the country's needs. There are immense iron reserves, but problems of extraction and purification are even greater than with nickel, and iron production is still almost negligible. The island was discovered in 1492 by Christopher Columbus. The Spanish conquest began in 1511 under the leadership of Diego de VELÁZQUEZ, who founded BARACOA and other major settlements. Cuba served as the staging area for Spanish explorations of the Americas. As an assembly point for treasure fleets, it offered a target for French and British buccaneers, who attacked the island's cities incessantly. The native ARAWAK Indians soon died off and were replaced as laborers by Negro slaves, who contributed much to the cultural evolution of the island. The white element was continuously replenished by immigration, chiefly from Spain but also from other Latin American countries. Despite pirate attacks and the trade restrictions of Spanish mercantilist policies, Cuba, the Pearl of the Antilles, prospered. In the imperial wars of the 18th cent. other nations coveted the Spanish possession, and in 1762 a British force under George Pocock and the earl of Albemarle captured and briefly held Havana. Cuba was returned to Spain by the Treaty of Paris in 1763 and remained Spanish even as most of Spain's possessions became (early 19th cent.) independent republics. The slave trade expanded rapidly, reaching its peak in 1817. Sporadic slave revolts were brutally suppressed by the Spaniards. Desires for Cuban independence increased when representation at the Spanish Cortes, granted in 1810, was withdrawn, yet neither internal discontent nor filibustering expeditions (1848–51) led by Narciso LÓPEZ, achieved results. The desire of U.S. Southerners to acquire the island as a slave state also failed (see **OSTEND MANIFESTO**). Cuban discontent grew and finally erupted (1868) in the TEN YEARS WAR, a long revolt that ended

(1878) in a truce, with Spain promising reforms and greater autonomy. Spain failed to carry out most of the reforms, although slavery was abolished (1886) as promised. Revolutionary leaders, many in exile in the United States, planned another revolt, and in 1895 a second war of independence was launched with the brilliant writer José Martí as its leader. There was strong sentiment in the United States in favor of the rebels, which after the sinking of the *Maine* in Havana harbor led the United States to declare war on Spain (see SPANISH-AMERICAN WAR). The Spanish forces capitulated, and a treaty, signed in 1898, established Cuba as an independent republic, although U.S. military occupation of the island continued until 1902. The U.S. regime, notably under Leonard Wood, helped rebuild the war-torn country, and the conquest of yellow fever by Walter Reed, Carlos J. Finlay, and others was a heroic achievement. Cuba was launched as an independent republic in 1902 with Estrada Palma as first president, although the Platt Amendment (see PLATT, ORVILLE HITCHCOCK), reluctantly accepted by the Cubans, kept the island under U.S. protection and gave the United States the right to intervene in Cuban affairs. U.S. investment in Cuban enterprises increased, and plantations, refineries, railroads, and factories passed to American (and thus absentee) ownership. This economic dependence led to charges of "Yankee imperialism," strengthened when a revolt headed by José Miguel Gómez led to a new U.S. military occupation (1906-9). William Howard Taft and Charles MacGoon acted as provisional governors. After supervising the elections, the U.S. forces withdrew, only to return to guarantee order in the Negro insurrection of 1912. Sugar production increased, and in World War I the near-destruction of Europe's beet-sugar industry raised sugar prices to the point where Cuba enjoyed its "dance of the millions." The boom was followed by collapse, however, and wild fluctuations in prices brought repeated hardship. Politically, the country suffered fraudulent elections and increasingly corrupt administrations. Gerardo Machado as president (1925-33) instituted vigorous measures, forwarding mining, agriculture, and public works, then abandoned his great projects in favor of suppressing opponents. Machado was overthrown in 1933, and from then until 1959 Fulgencio Batista y Zaldívar, a former army sergeant, dominated the political scene, either directly as president or indirectly as army chief of staff. With Franklin Delano Roosevelt's administration a new era in U.S. relations with Cuba began. Sumner Welles was sent as ambassador, the Platt Amendment was abandoned in 1934, the sugar quota was revised, and tariff rulings were changed to favor Cuba. However, economic problems continued, complicated by the difficulties of U.S. ownership of many of the sugar mills and the continuing need for diversification. In March, 1952, shortly before scheduled presidential elections, Batista seized power through a military coup. Cuban liberals soon reacted, but a revolt in 1953 by Fidel Castro was abortive. In 1956, however, Castro landed in Oriente prov. and took to the Sierra Maestra, where, aided by Ernesto "Che" Guevara, he reformed his ranks and waged a much publicized guerrilla war. The United States withdrew military aid to Batista in 1958, with Cuba a tinder box and his army demoralized. Batista finally fled on Jan. 1, 1959. Castro, supported by young professionals, students, urban workers, and some farmers, was soon in control of the nation. Castro's social revolution began in a burst of popular enthusiasm, but many groups were soon disillusioned. Massive executions, often summary, of so-called war criminals were followed by dismissal, resignation, and frequent incarceration of prominent revolutionists such as Hubert Matos, who disagreed with Communist tendencies in the regime. Private press, radio, and television were first muzzled and then completely suppressed. Land reform was pushed energetically, but little land was apportioned to individual farmers, by 1970 the state owned almost 70% of the farmland. Industrial reform meant essentially confiscation. The expropriation of U.S. landholdings, banks, and industrial concerns, and an intensive program of vilification against the United States, led to the breaking (Jan., 1961) of diplomatic relations by the U.S. government. That same year Castro openly proclaimed his allegiance with the Communist camp. The Soviet Union replaced the United States as major trading partner, and since 1961 massive Soviet aid has maintained Cuba's economic and military security. Meanwhile Cuban exiles were pouring into the United States by the thousands, one result of their activities was the preparation of an invasion force

(trained mostly in Florida and Guatemala under the supervision of the U.S. Central Intelligence Agency) which landed on Giron Beach in the Bay of Pigs, Cuba, in April, 1961. It was quickly crushed—a debacle especially humiliating to the United States because of its involvement. Cuba's significance as a pawn in the COLD WAR was further dramatized the following year when the USSR began to buttress Cuba's military power and to build missile bases on the islands. In a dramatic confrontation President John F. Kennedy demanded (Oct., 1962) the dismantling of the missiles and ordered naval vessels to blockade the island, preventing further importation of offensive weapons. After a period of great world tension, during which several Soviet vessels turned away from Cuba, Soviet Premier Khrushchev (despite fiery denunciations by Castro and by Chinese Communists) agreed to withdraw the missiles. Shortly before Christmas, 1962, Castro released over 1,000 prisoners captured during the Bay of Pigs invasion in exchange for considerable quantities of food and medicine. His relations with other Latin American countries were harmed by his openly announced intention of spreading his revolution to those countries by guerrilla warfare. In Feb., 1962, the ORGANIZATION OF AMERICAN STATES (see also PAN-AMERICANISM and PUNTA DEL ESTE) formally excluded Cuba from its council, and by Sept., 1964, all Latin American nations except Mexico had broken diplomatic and economic ties with Cuba. After the death (1967) of Guevara while engaged in guerrilla activity in Bolivia, Cuban attempts to encourage revolution in other countries abated, and by the early 1970s the Castro government exhibited an interest in regaining the friendship of the Latin American nations and resumed diplomatic relations with several of them. In Cuba, Castro has remained in firm control, most of the thousands who had opposed him have fled the island (between Dec., 1965, and April, 1973, a Cuban government-controlled airlift carried more than 250,000 people between Havana and Miami, Fla.), and, despite economic disappointments, he is tremendously popular with the poorer people, who make up the bulk of the population. Perhaps his greatest success has been in increasing educational opportunities and dramatically reducing illiteracy. The principal institutions of higher learning are the Univ. of Havana (founded 1728, reorganized 1943 and 1960), in Havana, Universidad de Oriente, in Santiago de Cuba, and Central Universidad de las Villas, in Santa Clara. See W. F. Johnson, *The History of Cuba* (4 vol., 1920), Elie Abel, *The Missile Crisis* (1966), C. A. Chapman, *A History of the Cuban Republic* (1927, repr. 1969), R. R. Fagen, *The Transformation of Political Culture in Cuba* (1969), R. E. Ruiz, *Cuba, the Making of a Revolution* (1970), H. I. Blustein et al., *Area Handbook for Cuba* (1971), K. S. Karol, *Guerrillas in Power* (tr. 1971), Carmelo Mesa-Lago, ed., *Revolutionary Change in Cuba* (1971), Andrew Salkey, *Havana Journal* (1971), Bertram Silverman, comp., *Man and Socialism in Cuba* (1971), Hugh Thomas, *Cuba, the Pursuit of Freedom* (1971), L. Foner, *The Spanish-Cuban American War and the Birth of American Imperialism, 1895-1902* (2 vol., 1972), Lowry Nelson, *Cuba* (1972).

Cubango, river, Angola. See OKAVANGO, river.

Cuban missile crisis, 1962, major cold war confrontation between the United States and the Soviet Union. After the BAY OF PIGS INVASION, the USSR increased its support of Fidel Castro's Cuban regime, and in the summer of 1962, Nikita Khrushchev secretly decided to install ballistic missiles in Cuba. When U.S. reconnaissance flights revealed the clandestine construction of missile launching sites, President Kennedy publicly denounced (Oct. 22, 1962) the Soviet actions. He imposed a naval blockade on Cuba and declared that any missile launched from Cuba would warrant a full-scale retaliatory attack by the United States against the Soviet Union. On Oct. 24, Russian ships carrying missiles to Cuba turned back, and when Khrushchev agreed (Oct. 28) to withdraw the missiles and dismantle the missile sites, the crisis ended as suddenly as it had begun. The United States ended its blockade on Nov. 20, and by the end of the year the missiles and bombers were removed from Cuba. See D. L. Larson, ed., *The Cuban Crisis of 1962* (1963), Elie Abel, *The Missile Crisis* (1966, repr. 1968), Robert F. Kennedy, *Thirteen Days* (1969, repr. 1971), G. T. Allison, *Essence of Decision* (1971), Abram Chayes, *The Cuban Missile Crisis* (1974).

Cubberley, Ellwood Patterson, 1868-1941, American educator, b. Andrews, Ind., grad. Univ. of Indiana, 1891, Ph.D. Columbia, 1905. He was a pioneer

writer in the history of American education and served as president (1891-96) of Vincennes Univ. and as superintendent of schools (1896-98) in San Diego, Calif. In 1898 he joined the faculty of Stanford, becoming professor of education in 1906 and in 1917 dean of the school of education, which he administered until his retirement in 1933. His works include *Changing Conceptions in Education* (1909), *The History of Education* (1920), *Public School Administration* (1929), and *Public Education in the United States* (rev. and enl. ed. 1947). See J. B. Sears and A. D. Henderson, *Cubberley of Stanford* (1957), study by L. A. Cremin (1965).

cube, in geometry, regular solid bounded by six equal squares. All adjacent faces of a cube are perpendicular to each other, any one face of a cube may be its base. The dimensions of a cube are the lengths of the three edges which meet at any vertex. The volume of a cube is equal to the product of its dimensions, and since its dimensions are equal, the volume is equal to the third power, or cube, of any one of its dimensions. Hence, in arithmetic and algebra, the cube of a number or letter is that number or letter raised to the third power. For example, the cube of 4 is $4^3 = 4 \times 4 \times 4 = 64$. The problem to construct a cube with a volume equal to twice that of a given cube using only a compass and a straightedge is known as the problem of the duplication of the cube and is one of the famous GEOMETRIC PROBLEMS OF ANTIQUITY. The cube, or hexahedron, is one of only five regular polyhedra (see POLYHEDRON).

cubeb: see PEPPER.

cubism, art movement, primarily in painting, originating in Paris c. 1907. It began as an intellectual revolt against the artistic expression of previous eras. Among the specific elements the cubists abandoned were the sensual appeal of paint texture and color, subject matter with emotional charge or mood, the play of light on form, movement, atmosphere, and the illusionism that proceeded from scientifically based perspective. To replace these they employed an analytic system in which the three-dimensional subject (usually still life) was fragmented and redefined from several points of view described simultaneously within a shallow plane or within several interlocking and often transparent planes. In this analytic phase (1907-12) the cubist palette was severely limited, forms rigidly geometric, compositions subtle and intricate. Cubist abstraction as represented by the analytic works of Picasso and Braque intended an appeal to the intellect. This approach has been termed conceptual realism because the cubists sought to show everyday objects as the mind, not the eye, perceives them—from all sides at once. During the later, synthetic phase of cubism (1913 through the 1920s), paintings were composed of fewer and simpler forms based to a lesser extent on natural objects. Brighter colors were employed, and many artists introduced the *trompe l'oeil* element of COLLAGE. The works of Juan Gris are most representative of this phase. The major exponents of cubism included Picasso, Braque, Jean Metzinger, Gris, Duchamp, and Leger. Although few painters remained faithful to its tenets, many profited from its discipline. The several sources of cubist inspiration included the later work of Cézanne, the geometric forms and compressed picture space in his paintings appealed especially to Braque, who developed them in his own works. African sculpture, particularly mask carvings, had enormous influence in the early years of the movement. Picasso's *Les Femmes d'Alger* (1907, Mus. of Modern Art, New York City) is one of the most significant examples of this influence. Within this revolutionary composition lay much of the basic material of cubism. The cubist break with the tradition of imitation of nature was completed in the works of Picasso, Braque, and their many groups of followers. The major segments of the cubist movement included the Montmartre-based Bateau-Lavoir group of artists and poets (Max Jacob, Guillaume Apollinaire, Gertrude and Leo Stein, Modigliani, Picabia, Delaunay, Archipenko, and others), the Puteaux group of the Section d'Or salon (J. Villon, Leger, Picabia, Kupka, Marcoussis, Gleizes, Apollinaire, and others), the Orphists (Delaunay, Duchamp, Picabia, and Villon), and the experimenters in collage who influenced cubist sculpture (Laurens and Lipchitz). Although the cubist groups were largely dispersed after World War I, their collective break from visual realism had an enriching and decisive influence on the development of 20th-century art. It provided a new stylistic vocabulary and a technical idiom that remain forceful today. See also ORPHISM and articles on individual artists, e.g., GRIS. See Guillaume Apollinaire, *The Cubist Painters* (1913, tr. 1949), D. H. Kahnweiler,

The Rise of Cubism (1915, tr 1949), A H Barr, Jr, *Cubism and Abstract Art* (1936, repr 1966), Robert Rosenblum, *Cubism and Twentieth-Century Art* (rev ed 1967), Douglas Cooper, *The Cubist Epoch* (1971)

Cuchulain (kōō'hōōlīn), Irish legendary hero of Ulster, of prodigious strength and remarkable beauty. He is the central figure of the Ulster legends, the greatest work of which is the *Táin Bo Cualnge* [the cattle raid of Cooley]. The great feature of this is Cuchulain's stand at a ford on the boundary of Ulster, where he defended single-handedly his province against the armies of the rest of Ireland.

cuckoo, common name for members of the extensive avian family Cuculidae, including the ani and the roadrunner (*Geococcyx californianus*), widely distributed in temperate and tropical regions. Cuckoos are slender-bodied, long-tailed birds with medium to stout down-curved bills, pointed wings, short legs (except in the terrestrial species), and dull (usually grayish brown or rufous) plumage. They are generally insectivorous and arboreal. Of the parasitic Old World cuckoos, the common European cuckoo, *Cuculus canorus*, is typical. The female visits the nests of smaller birds, selecting those whose eggs match hers in color, and replaces an egg of the host with one of her own, she usually lays four or five eggs, each at 48-hr intervals and each in a different nest. The young cuckoo, being larger than its nest mates, displaces them from the nest and becomes the sole recipient of its foster parents' care. Each species of Old World cuckoo has its own unique pattern of parasitism, and different species choose different host species for their eggs. The cuckoo is referred to in the Bible, by Aristotle and Pliny, in mythology, and in English poetry. Its nesting habits have given us the word *cuckold*, and its simple but musical song, which gives it its name, was used by Beethoven in his Pastoral Symphony and is also imitated in the cuckoo clock. The American cuckoos look like attenuated pigeons; they are not parasitic and build flimsy nests of twigs. Typical are the black-billed and yellow-billed (*Coccyzus americanus*) cuckoos, known for their low, chuckling call notes. They frequent and breed at the edges of deciduous woodlands, either species tending the young of the other. These birds are valued as destroyers of harmful insects—particularly the tent caterpillar, which few other birds will eat. There are also western and southern species. Most gregarious of the cuckoos are the anis of the American tropics. The groove-billed ani, from 12 to 14 in (30–35 cm) long, has black plumage with a faint purple gloss. Anis nest colonially, several females together laying as many as 25 eggs in the same nest, and they may breed at any time of the year. Of the ground cuckoos, the roadrunner, or chaparral cock, of the southwest deserts is best known. It feeds mostly on small snakes and lizards, which it pounds to death with its heavy bill and swallows headfirst. The roadrunner speeds over the ground at up to 15 mi (40.3 km) per hr with its long tail extended horizontally, its head down, and its ragged crest erect. Roadrunners are weak fliers and nonmigratory. They build coarse nests in thorny bushes, because they lay at intervals, both eggs and young may appear together in the nest. Also included in the cuckoo family are the coucals, medium to large in size, slow-flying, mostly terrestrial birds of the tropics from Africa to Australia, e.g., the black coucal, *Centropus griffi*. Cuckoos are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Cuculiformes, family Cuculidae.

cucumber, fruit of *Cucumis sativus*, a species of Gourd whose many varieties are descended from a plant native to Asia and Africa. Cucumber is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Cucurbitaceae.

cucumber tree: see MAGNOLIA

Cucupa Indians: see COCOPA INDIANS

Cúcuta (kōō'kōōtā), city (1968 est pop 167,400), capital of Norte de Santander dept., NE Colombia, near the Venezuelan border, on the eastern cordillera of the Colombian Andes. An industrial city, Cúcuta is the center of a rich coffee, oil, and mineral region. The city was founded in 1733. Simon BOLÍVAR captured Cúcuta in 1813 and set out from there on his march to CARACAS. At Cúcuta the constituent congress of 1821 met to draft the constitution of Greater Colombia (present-day Venezuela, Ecuador, and Colombia). The city was rebuilt after an earthquake in 1875.

Cudahy, Michael (kūd'ahē), 1841–1910, American meat packer, b Co Kilkenny, Ireland. He went (1849) to Milwaukee and after 1856 worked for

meat-packing firms. In the 1870s he introduced refrigeration into the meat-packing industry. He became a partner of Philip D. Armour and later, with his brother John, established a packing company in Omaha, Nebr.

Cudahy, city (1970 pop 22,078), Milwaukee co., SE Wis., an industrial suburb of Milwaukee, on Lake Michigan, inc 1906. It was founded in 1892 by John and Patrick Cudahy as a site for their meat-packing enterprise, which remains a major industry. The city also produces pipe fittings, valves, drop forgings, packaging and bottling machinery, cranes, and truck seats.

Cuddalore or Kudalur (both kūdalōr'), town (1971 pop 101,345), Tamil Nadu state, SE India. It is a port on the Bay of Bengal and a district administrative center. Peanut products, cashew nuts, and sugar are the chief exports. Fort St. David, a stronghold of Tipu Sahib, is a notable architectural monument in Cuddalore.

Cuddapah (kūd'apā), city (1971 pop 66,238), Andhra Pradesh state, S central India. It is a district administrative center and a market for peanuts, cotton, tumeric, and onions. Paint and varnish are manufactured, and asbestos and barite are processed. Melons from the district are famous. The city was part of the Chola empire (11th–15th cent.). Muslims conquered it in 1565, and the British took control in 1800.

Cudworth, Ralph, 1617–88, English theologian and philosopher. He was a noted representative of the CAMBRIDGE PLATONISTS. Cudworth's most ambitious work, *The True Intellectual System of the Universe*, was never completed. The first part, a critique of atheistic materialism, appeared in 1678, and two parts were published posthumously as *A Treatise concerning Eternal and Immutable Morality* (1731) and *A Treatise on Freewill* (1838). In his works Cudworth attacked the materialistic philosophy of Hobbes and maintained the belief that moral ideas are innate in man. See study by J. A. Passmore (1951).

Cuenca (kwēng'ka), city (1970 est pop 77,300), alt c 8,000 ft (2,440 m), S central Ecuador. Founded in 1557, Cuenca is in one of the richest agricultural basins of the Ecuadorian Andes and is the commercial center of S Ecuador. The chief industry is weaving of Panama hats. Cuenca is known as the "marble city" because of its many fine buildings, including the cathedral, government palace, and university.

Cuenca, city (1970 pop 34,485), capital of Cuenca prov., E central Spain, in New Castile, at the confluence of the Huecar and Jucar rivers, c 3,000 ft (910 m) above sea level. This historic town retains its medieval character in the narrow streets, clustered houses, and bridges, the modern, industrial section (timber trade, furniture, pottery, paper, leather) called Curretaria, extends onto the Huecar plain. The city was taken (1177) from the Moors by Alfonso VIII of Castile. Cuenca was badly damaged in the Peninsular War and the Second Carlist War. It has a notable Gothic cathedral (begun 13th cent.). Nearby is the Ciudad Encantada [enchanted city], a fantastic labyrinth of eroded rocks.

Cuenod, Hugues (üg kwānō'), 1902–, Swiss tenor. Cuenod was educated in Lausanne, Basel, and Vienna. Noted for his interpretation of works ranging from Monteverdi to Stravinsky, he was still performing in his 70s.

Cuernavaca (kwārnāvā'ka), city (1970 pop 159,909), capital of Morelos state, S Mexico, in the Cuernavaca Valley. The city has flour mills and beverage, textile, and cement industries. Cuernavaca is also a popular tourist and health resort. In the city are beautiful churches, monasteries, a 16th-century Franciscan convent, a palace built by Hernán Cortés and now decorated with murals by Diego Rivera, and a formal garden that was frequented by Emperor Maximilian and Empress Carlotta. Nearby is the Toltec ruin, Xochicalco, built over limestone caves.

cuesta (kwēs'tā), asymmetric ridge characterized by a short, steep escarpment on one side, and a long, gentle slope on the other. The steep side exposes the edge of erosion-resistant rock layers that form the cuestas. They are usually formed by erosion in plains areas underlain by gently dipping sedimentary rock layers. Cuestas have a more gentle dip than similar structures called HOGBACKS. Along the U.S. Atlantic and Gulf coastal plains are found a series of low subdued cuestas composed of seaward-dipping and poorly cemented Cretaceous and Tertiary sandstones, while the intervening lowlands are underlain by impermeable clays. These conditions produce ideal structures for artesian water supply systems,

which have been extensively tapped by coastal cities. A well-known example of a cuesta is the Niagara cuesta that runs westward across W. New York State and Ontario, then swings northward, forming the peninsula between Lake Huron and Georgian Bay, and finally curves southward, forming the Door Peninsula between Green Bay and Lake Michigan. Following withdrawal of the last Pleistocene ice sheet about 10,000 years ago, Niagara Falls first formed where the Niagara River crosses the Niagara cuesta at Lewiston, N.Y., and Queenston, Ont. Since then, the falls have migrated nearly 7 mi (11 km) southward as a result of undercutting and rockfall, leaving the steep-walled Niagara Gorge to mark its path.

Cueva, Beatriz de la (bāātrēs' dā la kwā'va), d 1541, governor of Guatemala. After the death of her husband, Pedro de ALVARADO, she maneuvered her own election and became the only woman to govern a major American political division in Spanish times. A young, beautiful, and ambitious woman who styled herself the Hapless One (*La Sin Ventura*), she was drowned a few weeks after assuming office in the destruction of Ciudad Vieja by a mysterious flood from the volcano AGUA.

Cueva, Juan de la (hwān), 1550?–1610?, Spanish dramatist, one of the precursors of Lope de Vega. He spent the years from 1574 to 1577 in Mexico. Of his 14 plays, the most famous is the comedy *El infamador* [the scoundrel] (1581). Cueva rejected traditional dramatic unities and introduced national themes to the stage, laying the foundation for the national drama of Spain's Golden Age. His innovations included employing a variety of meters and reducing the comedy to four acts. See study by R. F. Glenn (1973).

Cui, César Antonovich (tsāzar' antō'nōvich kuē'), 1835–1918, Russian composer and critic, a military engineer by profession. As a music critic in St. Petersburg and Paris, he championed the group of nationalist Russian composers known as The Five, consisting of Rimsky-Korsakov, Balakirev, Mussorgsky, Borodin, and himself. Of these, he was the least distinctive composer. He was largely self-taught, and his best works are songs and short salon pieces, which avoid the technical deficiencies of his operas and orchestral music. See V. I. Seroff, *The Mighty Five* (1948), M. O. Zetlin, *The Five* (tr 1959).

Cuiabá (kōōyabā'), city (1970 pop 100,865), capital of Mato Grosso state, W Brazil, at the head of navigation on the Cuiaba River. Founded in the gold rush of the early 18th cent., it has been the state capital since 1818. The city is a trading center for an extensive cattle-raising and agricultural area. Economic development has been hampered by Cuiabá's isolation and by the shortage of labor. The chief means of communication is still the riverboat.

Cuismancu: see CHANCAY

Cujas or Cujacius, Jacques (zhāk kūzhās', kyōōjā'shās), 1522–90, French jurist and scholar of Roman law. He taught at Toulouse, Bourges, and elsewhere. Unlike previous scholars, he was relatively unconcerned with the practical applications of Roman law and wished primarily to study the ancient texts in their relation to history and literature. He is often considered the founder of the historical school of jurisprudence. Much of his critical effort was directed toward reconstructing in the original form the excerpts from eminent Roman jurists quoted in the Corpus Juris Civilis. Cujas prepared critical editions of works of Ulpian and Paulus.

Culbertson, Ely (ē'lē kŭl'bārtson), 1893–1955, American authority on contract bridge, b Rumania. His father was an American engineer then living in Rumania, and his mother was of Russian parentage. Culbertson introduced the first successful system of bidding in contract bridge, wrote numerous books on the game, edited *Bridge World* magazine, wrote a widely read newspaper column on bridge, and won many bridge tournaments. After World War II he wrote and lectured on world peace, setting forth his plans in the book *Must We Fight Russia?* (1946). See his autobiography, *The Strange Lives of One Man* (1940), and his *Contract Bridge for Everyone*, ed by Victor Mollo (rev ed 1969).

Culdees (kaldēz') [Irish, = servants of God], ancient monks of Ireland and Scotland, appearing after the 8th cent. Little is known of their origin, and their relationship to the monks of the Celtic Church, e.g., at Iona, is unclear. They were originally anchorites, but by the time of the reforms of St. Malachy (12th cent.) they had become secular canons living in community. They gained a reputation for extreme laxness. The last Culdee community, at Armagh, was disbanded in 1541.

Culebra Cut: see PANAMA CANAL

Culiacán (kōōlēakan'), city (1970 pop 358,812), capital of Sinaloa state, W Mexico, on the Culiacan River. It is situated on a hot coastal plain that produces tropical fruits, sugarcane, cotton, beans, and maize, cattle-raising is also important. Fine oysters come from the city's Pacific port. Altata Culiacan, founded in 1531, figured prominently in the early Spanish colonial period as a point of departure for northern expeditions, notably that of Francisco Coronado in 1540. Within the city are numerous plazas, an impressive cathedral, and luxuriant tropical gardens.

Cullen, Countee (koun'tē'), 1903-46, American poet, b. New York City, grad. New York Univ. 1925, M.A. Harvard, 1926. A major writer of the Harlem Renaissance—a flowering of Negro artistic and literary talent in the 1920s—Cullen wrote poetry inspired by American Negro life. His technique was conventional, modeled on that of John Keats, and his mood passed from racial pride and optimism in the 1920s to sadness and disappointment in the 1930s. Among his volumes of verse are *Color* (1925), *Copper Sun* (1927), *The Ballad of the Brown Girl* (1927), and *On These I Stand* (1947). See bibliography by Margaret Penny (1971).

Cullman, city (1970 pop 12,601), seat of Cullman co., N Ala., inc. 1875. It is a shipping and trade center for a cotton, timber, and dairy region. Cullman College is there, and St. Bernard College is nearby. Cullman was settled in 1873 by immigrants from Germany.

Culloden Moor (kālōd'an, -lō'dan), moorland in Inverness-shire, NE Scotland, in the Highland region. There, on April 16, 1746, English forces under the duke of Cumberland defeated the Highlanders under Prince Charles Edward Stuart, thus ending the Jacobite uprising of 1745.

Cullum, George Washington (kūl'am), 1809-92, American army officer, b. New York City, grad. West Point, 1833. In the Civil War, Cullum was made a brigadier general of volunteers (Nov. 1861) and served as chief of staff to General Halleck (1861-64) and as superintendent of West Point (1864-66). He is chiefly known for his excellent *Biographical Register of the Officers and Graduates of the U.S. Military Academy* (1850, 3d ed., 3 vol., 1891), which furnishes sketches of the graduates of West Point.

culminate, in astronomy, the maximum height in the sky reached by a celestial body on a given day. At the culminate the body is crossing the observer's CELESTIAL MERIDIAN and is said to be in upper TRANSIT.

Culpeper, Thomas Culpeper, 2d Baron, 1635-89, English colonial governor of Virginia. In 1673, with the earl of Arlington, he was granted all lands in Virginia not previously patented. In addition, Culpeper was granted (1675) the right of succession to the governorship of Virginia and soon replaced Sir William Berkeley. He remained in England and ruled through deputies until 1680, when Charles II required him to go in person to Virginia. His general pardon of all those who had participated in Bacon's Rebellion made him popular for a brief time, but after about four months he returned to England. When disturbances arising out of the low price of tobacco broke out in the colony, he was threatened with removal unless he remained in Virginia. During his second stay (1682-83) Culpeper hanged some of the planters who had destroyed tobacco plants and quarreled violently with the burgesses. Upon leaving the colony again in 1683 he was deprived of the governorship. However, in 1688 he procured from James II a renewal in perpetuity of his vast Northern Neck proprietary (see FAIRFAX OF CAMERON, THOMAS FAIRFAX, 6TH BARON).

cult, ritual observances involved in worship of, or communication with, the supernatural or its symbolic representations. A cult includes the totality of ideas, activities, and practices associated with a given divinity or social group. It includes not only ritual activities but also the beliefs and myths centering on the rites. The objects of the cult are often things associated with the daily life of the celebrants. The English scholar Jane Harrison pointed out the importance of the cult in the development of religion. Sacred persons may have their own cults. The cult may be associated with a single person, place, or object or may have much broader associations. There may be officials entrusted with the rites, or anyone who belongs may be allowed to take part in them.

cultivation, tilling or manipulation of the soil, done primarily to eliminate weeds that compete with crops for water and nutrients. Cultivation may be used in crusted soils to increase soil aeration and

infiltration of water, it may also be used to move soil to or away from plants as desired. Cultivation among crop plants is best kept at a minimum, excessive cultivation can be harmful as it may cause root pruning and loss of soil water due to increased evaporation.

cultivator, agricultural implement for stirring and pulverizing the soil, either before planting or to remove weeds and to aerate and loosen the soil after the crop has begun to grow. The cultivator usually stirs the soil to a greater depth than does the HARROW. See CULTIVATION.

culture, in anthropology, the way of life of a society. The scientific use of the term was established by Sir Edward Burnett Tylor in the late 19th cent. The concept of culture has proved so useful that it has spread to the other social sciences, to the humanities, and to the biological sciences. The concept of culture is used to distinguish human societies from animal groups. The customs, ideas, and attitudes shared by a group, which make up its culture, are transmitted from generation to generation by learning processes rather than biological inheritance. Adherence to these customs and attitudes is regulated by systems of rewards and punishments peculiar to each culture. Language and other symbolic media are the chief agents of culture transmission, but many behavior patterns are acquired through experience alone. A pattern of cultural universals is found in all societies. It includes such human institutions as social organization, religion, structure, economic organization, and material culture (tools, weapons, clothing). Societies are differentiated according to the degree of complexity of cultural organization. Basically, each human group has its own distinctive culture, but a complex society may contain subcultures determined by national origin, religion, or social status. Conversely, a common culture may be adopted by several different societies through peaceful or enforced culture contact. This involves acculturation, the process whereby the members of one group adopt the customs of another. The spread of culture traits through direct or indirect contact among groups is called diffusion. A culture area is the territory within which a certain configuration of culture traits is to be found. The two theories of culture that have dominated anthropological thought in the 20th cent are the structural-functional theory derived from Bronislaw Malinowski and the pattern-process theory derived from Franz Boas. Structural-functional theory focuses on social structure, while pattern-process theory emphasizes cultural patterns. Each theory attempts to explain all aspects of culture, and each is applied to all cultures. All anthropologists, however, recognize certain broad evolutionary sequences in the cultural history of mankind, particularly in the technological and economic spheres. These stages of development have not occurred everywhere at the same time, nor have all cultures passed through all of them. One or more stages may be skipped through culture contact or acculturation. The first stage is that of the food collectors—fishers, hunters, and vegetation gatherers who live in small migratory groups, following the food supply and camping in caves or temporary shelters, as in the Paleolithic and Mesolithic periods. The next stage is that of the food producers, who have learned to domesticate plants and animals and who live in settled villages, an example is the culture of the Neolithic period. This stage leads to the rise of urban centers, as in the great historic civilizations of the world. In classifying a contemporary culture according to its stage of development, its technological level should not be considered alone. The food collectors of the 20th cent., such as the Australian aborigines, cannot be equated with the Paleolithic hunters of 25,000 years ago, for the Paleolithic systems of kinship and religion, for example, were quite different. See Ruth Benedict, *Patterns of Culture* (1934), A. L. Kroeber and Clyde Kluckhohn, *Culture: A Critical Review of Concepts and Definitions* (1952), Margaret Mead, ed., *Cultural Patterns and Technical Change* (1953), Ralph Linton, *The Tree of Culture* (1955), Jack Lindsay, *A Short History of Culture* (1962), Ashley Montagu, ed., *Culture* (1968), P. L. Wagner, *Environments and Peoples* (1972).

Culver City, city (1970 pop 31,035), Los Angeles co., S Calif., a residential suburb of Los Angeles, inc. 1917. It is a center of the U.S. motion-picture industry, which began in the city c. 1915. The city's chief industrial products are electronic and aerospace equipment. West Los Angeles Univ. College of Law, a private law school, and a junior college are in Culver City. Directly south of the city is Los Angeles International Airport.

Culver's root: see FIGWORT

Cumae (kyōō'mē), ancient city of Campania, Italy, near Naples. According to Strabo, it was the earliest Greek colony in Italy or Sicily, and it seems to have been founded c. 750 B.C. by Chalcids. The area has yielded earlier non-Greek archaeological finds. Cumae founded a number of colonies and grew to be a great power. It repulsed Etruscan and Umbrian attacks, but fell in the late 5th cent. B.C. to the Samnites. Cumae supported Rome in the 2d cent. B.C. and adopted Roman culture, ultimately its inhabitants became Roman citizens. As neighboring cities rose to power, Cumae declined, although it did not disappear until the 13th cent. A.D. There are extensive Greek and Roman ruins, and the cavern where the famed Cumaean Sibyl (the priestess of Apollo mentioned by Vergil) uttered her prophecies may still be seen.

Cumaná (kōōmana'), city (1970 est. pop. 100,000), capital of Sucre state, NE Venezuela, on the Manzanares River near its mouth on the Gulf of Cariaco, an inlet on the Caribbean Sea. Coffee, tobacco, cacao, and sugar are exported. Founded in 1521 to exploit the pearl fisheries near Margarita island, Cumaná was often raided by the Dutch and British in the 16th and 17th cent. Frequently a victim of earthquakes, the city was severely damaged in 1929.

Cumans or Kumans (both kōō'manz), nomadic East Turkic people, identified with the Kipchaks (or the western branch of the Kipchaks) and known in Russian as Polovtsi. Coming from NW Asiatic Russia, they conquered S. Russia and Walachia in the 11th cent., and for almost two centuries warred intermittently with the Byzantine Empire, Hungary, and Kiev. They founded a nomadic state in the steppes along the Black Sea, and were active in commerce with the Orient and Venice. In the early 12th cent. the main Cuman forces were defeated by the Eastern Slavs. The Mongols decisively defeated the Cumans c. 1245. Some were sold as slaves, and many took refuge in Bulgaria and also in Hungary, where they were gradually assimilated into the Hungarian culture. Others joined the khanate of the Golden Horde (also called the Western Kipchaks), which was organized on the former Cuman territory in Russia.

Cumberland, Richard, 1631-1718, English philosopher. He was bishop of Peterborough from 1691. In his *De legibus naturae* [on natural laws] (1672) he first propounded the doctrine of utilitarianism and opposed the egoistic ethics of Thomas Hobbes.

Cumberland, Richard, 1732-1811, English dramatist, great-grandson of the 17th-century philosopher Richard Cumberland. His family connections earned him a clerical position with the British board of trade. The author of over 40 plays, he was most successful with his sentimental comedies, the best of which are *The Brothers* (1769) and *The West Indian* (1771). He also wrote two seldom read novels, *Arundel* (1789) and *Henry* (1795), and an autobiography (1806-7).

Cumberland, William Augustus, duke of, 1721-65, British general, third son of George II. Entering the army shortly before the outbreak (1740) of the War of the Austrian Succession, he was defeated by the French at Fontenoy (1745). Returning to England to put down the 1745 rising of the JACOBITES, he defeated Prince Charles Edward Stuart at Culloden Moor (1746) and earned the nickname "the Butcher" by his ruthless punishment of the rebels. Once more on the Continent, he averted the fall of Maastricht but was again defeated by the French in 1747. In the Seven Years War he signed (1757) a capitulation to the French (the Convention of KLOSTER ZEVEN) for which he was dismissed. See two biographical studies by Evan Charteris (1913, 1925).

Cumberland, county (1971 pop 71,497), 1,520 sq mi (3,937 sq km), N England, bordering on the Irish Sea to the west, Solway Firth to the north and west, and Scotland to the north. The county town is CARLISLE. The region, with adjacent Westmorland and N Lancashire, includes the area known as the LAKE DISTRICT. Cumberland is largely mountainous in the south and central area and low in the west, east, and north. Scafell Pike (3,210 ft/978 m) is the highest point in England. The chief streams are the Derwent, the Eden, and the Esk. Cumberland is a pastoral region (sheep and cattle grazing) with some crop farming. Coal and iron mining are important along the west coast. Other industries are quarrying (granite, limestone, and slate), chemical and textile manufacturing, and smelting. Tourism is important in the Lake District. There are nuclear-power plants at Windscale and Calder Hall. In 1974, Cumberland

became part of the new nonmetropolitan county of Cumbria. The district has remains of the great walls built during the Roman occupation. Cumberland was the scene of many centuries of border strife between England and Scotland.

Cumberland. 1 City (1970 pop 29,724), seat of Allegany co., NW Md., on the North Branch of the Potomac, settled 1750, inc 1815. It is an important railroad and shipping center for a coal-mining area. Its manufactures include textiles, synthetic fibers, tires, glass, metal products, petrochemicals, propellants, and plastics. Cumberland grew around the site of a trading post established (1750) by the Ohio Company at a natural gateway through the Appalachians to the Ohio valley. Fort Cumberland (built 1754) was the base of operations for the ill-fated Braddock expedition (1755) against the French and Indians and the site of Washington's first military headquarters (1757). The city became the eastern terminus of the Cumberland Road, or NATIONAL ROAD, a division point for the Baltimore & Ohio RR, and the western terminus of the Chesapeake and Ohio Canal (completed 1850), which now runs through Green Ridge State Forest. Other local attractions include the old toll gate house (1833) and the Narrows, a magnificent gorge through the Appalachians to the Ohio valley. A junior college is in the city and Frostburg State College is to the west. 2 Town (1970 pop 26,605), Providence co., NE R.I., on the Blackstone River and the Mass. line, included in Massachusetts until 1746, inc as a R.I. town 1747. Its manufactures include textiles and metal and fiber-glass products. The Ballou Meetinghouse dates from c 1740.

Cumberland, river, 687 mi (1,106 km) long, rising in E Ky. and winding generally SW through Ky and Tenn., then NW to the Ohio River near Paducah, Ky., drains c 18,500 sq mi (47,910 sq km). Locks and canals make the river navigable for small craft for much of its length. The river's upper course flows through the rugged, forested coal-mining region of SE Kentucky, where its valley is a main transportation route. The central section of the river passes through the Nashville Basin, an agricultural region and the site of Nashville, Tenn. The Tennessee Valley Authority markets hydroelectric power produced by dams on the Cumberland and its tributaries, including Wolf Creek Dam, Ky. (270,000-kw capacity), which impounds Lake Cumberland, Dale Hollow Dam (\$4,000 kw), Center Hill Dam (135,000 kw), and Barkley Dam (130,000 kw). The Cumberland valley was the scene of several important Civil War battles (see FORT DONELSON).

Cumberland Gap, natural passage through Cumberland Mt., near the point where Virginia, Kentucky, and Tennessee meet. The gap was formed by the erosive action of a stream that once flowed there. It was discovered and named in 1750 by Dr. Thomas Walker, leader of a land company exploration party. Daniel Boone's WILDERNESS ROAD ran through the gap. A strategic point in the Civil War, the gap was held alternately by Confederate and Union forces. Cumberland Gap National Historic Park was established there in 1955 (see NATIONAL PARKS AND MONUMENTS, table).

Cumberland Island National Seashore, Ga. see NATIONAL PARKS AND MONUMENTS, table.

Cumberland Plateau or **Cumberland Mountains**, southwestern division of the Appalachian Mt. system, extending northeast to southwest through parts of West Virginia, Virginia, Kentucky, and Tennessee into N Alabama, Black Mt., Ky., is the highest point (4,145 ft/1,263 m). On the east the plateau rises sharply from the Great Valley of E Tennessee, on the west the slope is rough and broken. The plateau is the source of the Cumberland River and several tributaries of the Tennessee. The surrounding region, which is sparsely populated, yields various minerals, especially coal. The coal is strip-mined, the removal of surface material and the building of unsightly spoil dumps have killed vegetation and interfered with stream flow by causing accelerated erosion and flooding. Cumberland Gap provides a natural passage through Cumberland Mt., a ridge of the plateau.

Cumberland Presbyterian Church, branch of the Presbyterian Church in the United States founded in 1810. In 1906 many of its congregations were united with the main body of the church. It began as a revival movement in the "Cumberland country," a newly settled region of Kentucky and Tennessee. The Negro members organized separate churches, and in 1869 they were legally set apart as the Colored Cumberland Presbyterian Church. The church has a combined membership of c 90,000.

Cumberland Road. see NATIONAL ROAD.

Cumberland Valley, 75 mi (121 km) long and from 15 to 20 mi (24-32 km) wide, part of the great Appalachian valley, between the Potomac and Susquehanna rivers, W Md. and S Pa. It is a fertile farming area that is now becoming urbanized, Chambersburg and Carlisle, Pa., and Hagerstown, Md., are in the valley.

Cumbernauld, new town and burgh (1971 pop 31,784), in the detached, eastern portion of Dunbartonshire, Glasgow. Cumbernauld, the 15th of Britain's NEW TOWNS, was designated in 1955 to alleviate Glasgow's growth problems. Its population target was set at 70,000, anticipating that 80% of the immigrants would come from Glasgow. Cumbernauld's industries include food processing and the manufacture of adding machines and adhesive products. It was the first new town in which automobile traffic was adequately anticipated and provided for. Wherever possible, vehicular roads were completely separated from pedestrian ways. Under the local government act of 1973, Cumbernauld was included in the new region of Strathclyde.

Cumbria, nonmetropolitan county (1972 est pop 476,000), extreme NW England, created under the Local Government Act of 1972 (effective 1974). It is composed of the county boroughs of Barrow-in-Furness and Carlisle, the former counties of Cumberland and Westmorland, and parts of the former counties of Lancaster and Yorkshire (West Riding).

Cumbrian Mountains, mountains of the Lake District, NW England, Scafell Pike (3,210 ft/978 m) is the highest point. Studded with lakes and narrow valleys, the range extends through Cumberland, Westmorland, and N Lancashire.

cumin or **cummin** (both kŭm'ĭn), low annual herb (*Cuminum cyminum*) of the family Umbelliferae (CARROT family), long cultivated in the Old World for the aromatic seedlike fruits. The fruits resemble the related caraway and are similarly used in cooking. Cumin is an ingredient of curry powder, the oil is used for liqueurs and in veterinary practice and was formerly used in medicine. Cumin is mentioned in the Bible. For black cumin, see LOVE-IN-A-MIST. Cumin is classified in the division MAGNOLIOPHYTES, class Magnoliopsida, order Umbellales, family Umbelliferae.

Cumming, John: see COMYN, JOHN.

cummings, e e (Edward Estlin Cummings), 1894-1962, American poet, b. Cambridge, Mass., grad Harvard, 1915. His poetry, noted for its eccentricities of typography, language, and punctuation, usually seeks to convey a joyful, living awareness of sex and love. Among his 15 volumes of poetry are *Tulips and Chimneys* (1923), *Is 5* (1926), and *95 Poems* (1958). A prose account of his war internment in France, *The Enormous Room* (1922), is considered one of the finest books ever written about World War I. Cummings was also an accomplished artist whose paintings and drawings were exhibited in several one-man shows. See his *Complete Poems, 1913-1962* (2 vol., 1972), studies by B. A. Marks (1964) and Norman Friedman, comp. (1972).

Cummings, Homer Stille, 1870-1956, American lawyer, U.S. Attorney General, b. Chicago. He practiced law in Stamford, Conn., where he was mayor three times. He rose to prominence in the state Democratic organization, served as a state representative on the Democratic National Committee, (1900-1925), and was chairman of the National Committee (1919-20). When Thomas J. Walsh, whom President Franklin Delano Roosevelt had named Attorney General, died just before the inauguration in 1933, Cummings was given a temporary appointment to fill the position. The appointment was made permanent in April, 1933, and he served until 1939.

cumingtonite (kŭm'ĭngtənīt) see AMPHIBOLE.

Cummins, Albert Baird, 1850-1926, U.S. Senator from Iowa (1909-26), b. Green co., Pa. He studied law in Chicago and in 1878 joined his brother in practice in Des Moines. As governor of Iowa (1901-8), Cummins worked to break up railroad domination in politics and to inaugurate progressive policies in the state. He was elected (1908) to the U.S. Senate and was co-author there of the Esch-Cummins Transportation Act of 1920.

cumulonimbus, see CLOUD.

cumulus: see CLOUD.

Cunard, Sir Samuel (kyōōnārd'), 1787-1865, Canadian pioneer of regular transatlantic steam navigation, b. Halifax, N.S. The son of a United Empire Loyalist, he became a leading businessman of Nova Scotia and engaged in banking, lumbering, shipping and shipbuilding enterprises. His fleet at one

time numbered some 40 vessels. He was interested in the development of steam navigation and owned shares in the *Royal William*, the first Canadian steamer to cross the Atlantic (1833) from Canada to England. When the British government invited bids (1838) for carrying mail to and from Liverpool, Halifax, and Boston, Cunard went (1839) to England and presented to the admiralty such carefully considered plans for a line of steamships that he received the contract. In association with others, he formed the British and North American Royal Mail Steam Packet Company, which in 1840 placed four ships in operation, establishing the first regular steamship service between the continents. This was the beginning of the noted Cunard Line. See F. E. Dodman, *Ships of the Cunard Line* (1955).

Cunaxa (kyōōnāk'sā), ancient town of Babylonia, near the Euphrates River, NE of Ctesiphon. It was the scene of a battle (401 B.C.) between CYRUS THE YOUNGER and ARTAXERXES II, described by XENOPHON in the *Anabasis*. CLEARCHUS, Spartan mercenary leader under Cyrus, chose to attack the Persian left wing (under Tissaphernes), which he completely routed and pursued. When he and his Ten Thousand returned, they found that Cyrus had fought hard in the center, had broken Artaxerxes' bodyguard, but in the moment of victory had been killed. Cyrus' army, demoralized, had broken up, and the Persians had taken the field. The retreat of the Ten Thousand northward is the most famous feature of the campaign.

cuneiform (kyōōnē'fōrm) [Lat. = wedge-shaped], system of WRITING developed before the last centuries of the 4th millennium B.C. in the lower Tigris and Euphrates valley, probably by the Sumerians. The characters consist of arrangements of wedge-like strokes generally impressed with a stylus on wet clay tablets, which were then dried or baked. The history of the script is strikingly parallel to that of the Egyptian HIEROGLYPHIC (see also ALPHABET and INSCRIPTION). The normal Babylonian and Assyrian writing used a large number (300-600) of arbitrary cuneiform symbols for words and syllables, some

pictograph original	pictograph as positioned in later cuneiform	early Babylonian cuneiform	Assyrian	meaning
				heaven god
				earth
				woman
				to drink
				fish
				sun day
				donkey
				orchard
				to plow to till

Examples of the development of cuneiform

had been originally pictographic. There was an alphabetic system, too, making it possible to spell a word out, but because of the adaptation from Sumerian, a different language, there were many ambiguities. A single symbol could be used to represent a concept, an object, a simple sound or syllable, or to indicate the category of words requiring additional definition. Cuneiform writing was used outside Mesopotamia also, notably in ELAM and by the Hittites (see ANATOLIAN LANGUAGES). There are many undeciphered cuneiform inscriptions, apparently representing several different languages. Cuneiform writing declined in use after the Persian conquest of Babylonia (539 B.C.), and after a brief renaissance (3d-1st cent. B.C.) ceased to be used in Mesopotamia. A very late use of cuneiform writing was that of the Persians, who established a syllabary for Old Persian. This is the writing of the Achaemenids (mid-6th cent. B.C.-4th cent. B.C.), whose greatest monument is that of Darius I at Behistun. Key discoveries of cuneiform inscriptions have been made at Nineveh, Lagash, Erech, Tel el Amarna, Susa, and Bogazköy. Two great names in the interpretation of cuneiforms are those of Sir Henry C. RAWLINSON and G. F. GROTEFEND. See Edward Chiera, *They Wrote on*
